"Mr. Stiles inquired whether we would be willing to give them an exclusive license for Canada. I replied that we would be willing to consider such a matter and that the charge would be based on a commuted royalty for a minimum and maximum tonnage. I explained briefly our ideas about limited production and both gentlemen expressed themselves as being heartily in accord with our ideas. Mr. Stiles remarked that if they should decide to throw their present 300 tons per day production into this process, he assumed that would be given special consideration, and I said it would, as of course that would be a replacement of tonnage and not an addition of tonnage.

* * * * * * *

"C. H. G."

For reasons that do not appear the Consolidated Mining & Smelting Co. did not take a license under New Jersey's Canadian vertical retort process patents at this time. The matter was brought up again in 1937 as appears from an interoffice memorandum written by F. B. Searhart of New Jersey dated October 23, 1937 (exhibit 35), which refers to a visist to a New Jersey vertical retort plant by representatives of the Consolidated Mining & Smelting Co., including a Mr. McBean. The memorandum reads in part as follows—I quote:

* * * * * * *

"On the previous visit of Mr. McBean, which was during the week of September 20, he had expressed a desire to see the vertical smelter plant and mentioned to the writer that he had suggested to his management that a battery of spelter furnaces be installed at Trail in order to act as a balance wheel to the present electrolytic zinc producing capacity. He informed us that they were extremely short of electric energy during the winter months and it was necessary for them to curtail the production of metal. While they have under consideration the installation of more hydroelectric plants and have two rivers in mind for this operation, Mr. McBean is of the opinion that it would be more to the point if the capital were placed in the erection of spelter furnaces.

* * * * * * *

"F. B. SEARHART."

It appears that nothing came of the negotiations at this time between Consolidated and New Jersey, for on February 28, 1941, Mr. Blaylock, president of Consolidated, wrote New Jersey as follows—I quote (exhibit 36):

Re: Zinc retort process.
J. E. HAYES, Esq.,
President, The New Jersey Zinc Co.,
160 Front Street, New York, N. Y.

DEAR MR. HAYES: It is possible, and even probable, that we will be requested to produce more zinc for the British Munitions people. We haven't sufficient power to instal any more electrolytic zinc at Trail and cannot develop an additional supply in time.

I would like to know if you are willing to license us to use your continuous retort process, and if so, on what terms. We had some correspondence with you several years ago but that would be out of date by now—particularly as far as commutation of royalties was concerned. We have in mind the possibility of building a plant capable of producing 60 tons of zinc per day.

* * * * * * *

Digitized by Google

In addition to this plant at Trail, it is possible that either we or somebody else may be commissioned to build a complete zinc plant somewhere in Eastern Canada for between 50 and 75 tons of zinc per day.

Yours sincerely,

[Sgd.] S. G. BLAYLOCK.

SGBlaylock.ap

MARCH 6, 1941.

Via Air Mail

Mr. S. G. BLAYLOCK,
President, Consolidated Mining & Smelting Co. of Canada Limited,
Trail, B. C., Canada.

* * * * * * *

DEAR SIR: We are prepared to grant to your Company right and license under our Canadian patents relating to the vertical retort zinc smelting process on the general terms set out below, subject, particularly, however, to the limitations shown with respect to the export of product to the United States or other licensed territories. As you no doubt are aware, we sold our British patents relating to this process to The National Smelting Company Limited, of London, and under the terms of sale the product of the inventions is not to be exported to the United States nor to other licensed territories; in turn, we undertook to make similar requirements of all other licensees as to export to the United States and other licensed territories including Great Britain. It seems to us that under present conditions, however, there should be no difficulty in obtaining the waiver of these limitations as to export to Great Britain during the present emergency.

* * * * * * *

NONEXPORT OF PRODUCT TO TERRITORY LICENSED TO OTHERS

The licensee would undertake not to practice the licensed inventions except in Canada and particularly not to export nor so far as lies in its power permit the export of the products of these inventions to the United States or to any other country in which at such time we have licensed another with respect to these inventions with notice to the licensee in writing by us. Also, the licensee would undertake to comply with reasonable requirements from us as to the marking of the product of the inventions in such manner as would assist in identifying its origin and excluding it from entry into the prohibited territories.

* * * * * * *

Yours very truly,

C. G., *General Manager, Patents Department.*

C. H. George/JH.

Mr. Blaylock wrote Mr. Hayes, president of New Jersey, on March 12, 1941, as follows—I quote (exhibit 38):

Re: Retort zinc process.

J. E. HAYES, Esq.,
President, New Jersey Zinc Co.,
160 Front Street, New York, N. Y.

DEAR MR. HAYES: I wish to thank you for your letter of March 4th and to say that I have had a fairly complete letter from Mr. George.

The fact that we would be unable to sell zinc produced by this process in Great Britain and other countries is rather serious as 85% of our zinc production has to be exported. However, I am going East the end of this month and if

Digitized by Google

the question is still of vital importance to the British war effort I will try to arrange to visit you and your people.

Yours sincerely,

[Sgd.] S. G. BLAYLOCK.

S. G. Blaylock.ap.

Consolidated Mining & Smelting Co. did not take a license under New Jersey's Canadian vertical-retort process patents at this time. It may be that the reason Consolidated did not take a license was because the proposed license would have prohibited Consolidated from exporting zinc metal produced by the licensed process to the United States, Great Britain, and other licensed territories.

NEW JERSEY'S FOREIGN PATENTS

On December 14, 1933, New Jersey sold its British vertical retort and fractionation process patents to the National Smelting Company, Ltd., a British corporation for $2,000,000, payable in installments. As part of the sales agreement National Smelting Company, Ltd., agreed not to export zinc metal produced by these processes to the United States or to any other country in which at the time of export New Jersey had granted licenses to another under its corresponding foreign patents. National Smelting Company, Ltd., agreed to mark the zinc metal produced by the licensed processes in such a manner as to enable New Jersey to identify its origin and exclude it from entry into prohibited territories. (See exhibit 39.)

On September 16, 1935, New Jersey licensed jointly Metallgesellschaft, A. G., a German corporation, and its American representative, the American Lurgi Corporation, under New Jersey's German fractionation process patents (exhibit 40).

Metallgesellschaft, A. G. is closely affiliated with the I. G. Farbenindustrie of Germany. Metallgesellschaft, A. G., and the I. G. Farbenindustrie jointly own the aluminum plant at Bitterfelt, Germany. We are also advised that the I. G. Farbenindustrie is represented on the Metallgesellschaft, A. G.'s board of directors. A close relationship also exists between Metallgesellschaft, A. G., and the United Aluminum Corporation of Germany, which is owned by the Third Reich.

In sharp contrast with New Jersey's license to the American Smelting & Refining Co. in this country, which limits production to 5,000 tons of high-grade zinc per year, and in sharp contrast with New Jersey's license to du Pont in this country, which prohibited du Pont from producing high-grade zinc by the licensed process, New Jersey's license to Metallgesellschaft, A. G., placed no limit whatever upon the quantity or quality of zinc metal that could be produced by the licensed process provided the proper royalty payments were made. New Jersey, of course, was interested in producing maximum production in Germany in order to procure the maximum revenue in royalties from that country.

Metallgesellschaft, A. G., did agree, however, not to export zinc metal produced by the licensed process to the United States or to any other country in which at the time of export the licensor had granted rights to another under the corresponding foreign patents. Metallgesellschaft also agreed to comply with the licensor's requirements as to the marking of the zinc metal in such a manner as would enable New Jersey to identify its origin and exclude it from entry into prohibited territories.

The license from New Jersey to Metallgesellschaft was amended on February 23, 1939, to include as part of the license territory the former country of Austria which had recently been annexed to Germany (exhibit 41).

On September 16, 1935, New Jersey, with the consent of Metallgesellschaft, licensed Unterharzer Berg—und Huttenwerke, G. m. b. H., a German corporation, under New Jersey's German vertical retort and fractionation-process patents (exhibit 42). As in the case of the license to Metallgesellschaft, A. G., New Jersey placed no limitation upon the quantity or quality of zinc metal that could be produced by the German company provided the proper royalty payments were made, but the licensee agreed to observe New Jersey's customary restrictions upon the export of zinc metal produced by the licensed processes.

Although the formal license agreement between New Jersey and Metallgesellschaft, A. G., and the formal license agreement between New Jersey and Unterharzer Berg—und Huttenwerke, G. m. b. H., were not executed until September

Digitized by Google

16, 1935, production by New Jersey's processes was actually begun in Germany in 1934 in accordance with an option to acquire a license from New Jersey then held by Metallgesellschaft, A. G. Even at this early date, in 1934, Germany recognized the value of New Jersey's processes for military purposes. I quote from a letter written from Berlin on May 4, 1934, by L. Odendall, representative in Germany of the American Smelting & Refining Co., to S. H. Levison, general manager of the American Smelting & Refining Co. in this country (exhibit 43):

BERLIN W. 35, *May 4, 1934.*
Tiergartenstr. 8.

Vertical versus horizontal retorts.

Mr. S. H. LEVISON,
General Manager, American Smelting & Refining Co.,
New York, U. S. A.

DEAR MR. LEVISON: It just occurs to me that you might be interested in an interview with Director Seiffert of the "Berzelius" Metallhutten G. m. b. H. at Duisburg, which has been published in No. 8 of Metallwirtschaft on February 23rd. You will remember that we have met Mr. Seiffert on the occasion of your visit at Duisburg.

Mr. Seiffert said in the interview that two German engineers have carefully examined the operations of the New Jersey Zinc Company and have received all informations on the cost of installation and operation. The result of this study is, according to Mr. Seiffert, as follows:

The zinc loss in the vertical retort is about the same as in the horizontal retorts. The costs of operation with good ores are somewhat lower with vertical retorts than with horizontal retorts; but it seems that this difference is increased in favour of the vertical retort if ores with high iron contents are treated.

The quality of the zinc produced in the vertical retort without any additional apparatus is better than the quality obtained in horizontal retorts as far as the iron and lead contents are concerned. As it is, no doubt, easier to get workmen for the operation of the vertical muffles, new installations would no doubt be equipped with vertical retorts. It would, however, not be advisable in Germany to replace the horizontal retorts of a well-operating plant by vertical retorts.

The costs of erection are about the same for vertical as for horizontal retorts. The quality of the zinc produced in the vertical muffle is better, as mentioned above, than that obtained in the horizontal retort. In order to produce high-grade zinc, an additional process is to be used, which has likewise been developed by the New Jersey Zinc Company. By means of this process high-grade zinc can be produced not only from the zinc obtained in the vertical retort, but also by refining any raw zinc produced in a horizontal retort. The high-grade zinc thus obtained has a purity of 99.99% zinc. *It is very important for Germany that such an installation can be erected at any place with relatively low cost, in order to produce during times of crisis high-grade zinc from raw zinc or zinc scrap as long as these materials are available.*

Also this process has been studied by two German engineers and a refining plant with a daily capacity of 16 tons of high-grade zinc to be produced from German raw zinc is under construction and will start operations probably in June 1934.

* * * * * * *

[Italics supplied.]

Yours very truly,

[S.] L. ODENDALL.

CC/Mr. K. C. Brownell.

File.
LO/Le.

Germany continued to expand its production of zinc by New Jersey processes, as appears from the Minerals Yearbook for 1939. I quote:

"Construction of a second unit of eight continuously operated vertical retorts at Oker was completed in 1939, and construction of sixteen more retorts has begun."

Undoubtedly New Jersey's licenses to the German companies, permitting the unlimited production of high-grade zinc, represented a substantial contribution to the German war machine. On September 22, 1939, Deutscher Volkswirt, a

Digitized by Google

weekly industrial and financial publication of Germany, made the following boast:

"* * * In 1938, Germany was for the first time the biggest producer of aluminum, and Germany produces and consumes more magnesium than all the rest of the world. *Secondly*, the transition from tin metal alloys to alloys with lead again is favorable to Germany, and Germany is actually leading because she has more lead than tin. *Thirdly*, the transition from copper and brass to zinc in particular in small die castings and fittings products, has favored Germany; she is now the greatest producer of zinc in the world after Poland has been destroyed. * * *"

On February 23, 1936, New Jersey licensed the Societe Generale des Minerais, a Belgian corporation, under its French, Moroccan, Tunesian, Spanish, Norwegian, Belgian, Belgian Congo, Holland, Polish, Czechoslovakian, and Luxembourg fractionation process patents (exhibit 44). Here also New Jersey placed no limitation upon the quantity or quality of zinc metal that could be produced by the licensed process provided the proper royalty payments were made. The Societe Generale des Minerais agreed not to export zinc metal produced by the licensed process to the United States or to any other country in which at the time of export the licensor had granted rights to another under the corresponding foreign patents. New Jersey in turn agreed not to export zinc metal produced in the United States by the licensed process to the territory covered by the licenses to the Societe Generale des Minerals.

New Jersey granted the Societe Generale des Minerais an option to acquire the aforementioned licenses on March 10, 1934 (exhibit 45). As early as November 1933 the matter had been the subject of negotiations between New Jersey and M. Pisart, representing the Societe Generale des Minerais. The proposed Polish license under New Jersey's fractionation process was of special concern to New Jersey, for the reason that the Anaconda Copper Mining Co. owned and operated an electrolytic zinc plant in Poland and "personal relations" existed in this country between Mr. Hayes, president of New Jersey, and Mr. Kelly, president of Anaconda. I quote from a memorandum written by Mr. George, of New Jersey, on November 16, 1933, in this connection (exhibit 46):

* * * * * * *

"One other point discussed was in connection with the proposed licensing of a group in Poland and Czecho-Slovakia. We understood that the group in question is backed by French capital. Mr. Hayes mentioned to Mr. Pisart that in view of his personal relations with Mr. Kelly, of Anaconda here, he would not want to do anything in Poland which Mr. Kelly might think was adverse to the interests of the Anaconda Company in that country. Mr. Pisart said he had mentioned the matter to Mr. Kelly, and that there had been no reaction on Mr. Kelly's part. Mr. Pisart did not think that Mr. Kelly's interests would be seriously affected, as he thought that the zinc to be produced in Poland under our processes was intended for export to Russia. He said that if Mr. Kelly raised any question about the matter with Mr. Hayes, Mr. Hayes should refer Mr. Kelly to Mr. Pisart, and Mr. Pisart would undertake to settle the matter.

"C. H. G."

On September 9, 1937, New Jersey licensed the Societa Italiana del Piombo E. Dello Zinco, an Italian corporation, under New Jersey's Italian fractionation process patents (exhibit 47). New Jersey placed no restriction upon the amount or quality of zinc metal that could be produced by the licensed process provided the proper royalty payments were made. This license contained the customary mutual nonexport provisions.

The license agreements between New Jersey and the Societe Generale des Minerais were amended on February 23, 1938, and the licensed territory was extended to include Denmark, Sweden, Switzerland, Finland, Esthonia, Latvia, and Lithuania (exhibit 48). Of the newly licensed territories, Sweden was the only country in which New Jersey held patents on the fractionation process. As to the other newly licensed territories, the license agreement did not purport to be a conveyance of rights under letters patent but was an undertaking on the part of the licensor to provide the licensee with confidential information, including working directions applicable in the use of the fractionation process and to lend to the licensee the licensor's cooperation and assistance in the exercise and use of the inventions and to withhold from others for use in such territories such confidential information, working directions, cooperation, and assistance. The amendment contained the customary mutual nonexport provisions.

Digitized by Google

On June 14, 1939, New Jersey licensed the Financial & Investments Co., "Fininco," S. A., a Luxemburg corporation controlled by the Societe Generale des Minerais, to use the fractionation process in Rumania and Hungary (exhibit 49). The agreement did not purport to be a conveyance of rights under letters patent of Rumania and Hungary, for New Jersey held no patents in Rumania and Hungary, but (as in the case of the February 23, 1938, amendment to the Societe Generale des Minerais license) the licensor undertook to provide the licensee with confidential information, including working directions applicable in the use of the fractionation process and to lend to the licensee the licensor's cooperation and assistance in the operation, the exercise and use of the inventions, and to withhold from others for use in the licensed territory such confidential information, working directions, cooperation, and assistance. New Jersey placed no restriction upon the amount or quality of zinc metal that could be produced by the licensed process provided the proper royalty payments were made. Said agreement contained the customary mutual nonexport provisions.

CONCLUSION

From the above it will be seen that the policy of New Jersey has been to issue licenses freely to European companies for the unlimited production of high-grade zinc by New Jersey processes. This policy is directly counter to the policy New Jersey has pursued in this country. New Jersey has repeatedly refused to license its processes to domestic companies for the production of high-grade zinc, and has repeatedly indicated that New Jersey believes in a policy of limited production, of restricted production—New Jersey's "principal interest being to avoid the production of additional high-purity zinc."

We believe that patent controls as exercised by the New Jersey Zinc Co. are the principal cause of the present shortage of high-grade zinc in this country. We believe that some legislative provision should be adopted whereby New Jersey's patented processes can be made available to the entire domestic zinc industry in order to alleviate the present shortage of high-grade zinc and to insure that the present shortage shall not become increasingly and dangerously acute.

EXHIBIT NO. 135

PARAFLOW AND METHANE STEAM PROCESS (STANDARD OIL OF NEW JERSEY AND I. G. FARBEN)

Statement by John R. Jacobs, Jr.

INTRODUCTION

My testimony before this committee will be limited to a discussion of a product called Paraflow and the Methane Steam process, both of which were directly affected by the cartel arrangement of 1929 between Standard Oil of New Jersey and the I. G. Farbenindustrie of Germany. The formation of this cartel between these two industrial empires operated, as to Paraflow, to create a complete monopoly and give to I. G. royalties which should have gone to American industry. As to the Methane Steam process, the effect was to restrain its use and thus to prevent our strategic explosives industry from obtaining necessary licenses under the patents to increase our war production.

Before taking up these subjects, however, let me sketch briefly the Standard-I. G. basic relationship. I use the word "briefly" because later in the week a witness is going to appear before this committee and present a thorough history of this cartel arrangement from 1929 to date.

On November 9, 1929, Standard and I. G. executed what is referred to by the parties as the "division of fields agreement." Under this instrument, Standard agreed to transfer to I. G. control of any new chemical development not closely related to Standard's then business. I. G., in turn, agreed that should it desire to go into the chemical business anywhere in the world, outside of Germany, that could not be carried on except as a department of the oil and gas business, I. G. would give Standard control. I. G. also agreed to share with Standard, outside of Germany, any new chemical development using petroleum or natural gas as a raw material, but control would be with I. G. Since this agreement was to run at least until 1947, Standard, in effect, promised to stay

Digitized by Google

out of the chemical business for 18 years, except as a junior partner of I. G., and not complete with I. G. It is also worth noting that I. G. did not undertake to turn control of any new chemical development in Germany over to Standard, even though the development should be closely related to the oil business and Standard was given control throughout the rest of the world. On the other hand, Standard did not obtain any such concession from I. G. for the United States. As far as Standard was concerned, I. G. could control any chemical developments outside of the oil field in the United States or anywhere else.

In 1930 Standard and I. G. organized, under the laws of Louisiana, a corporation called Jasco, Inc., for the purpose of carrying out the intention expressed by the parties in the division of fields agreement. Ostensibly, this joint venture was a partnership as each company owned a half interest, but as a matter of fact it was under I. G.'s control. This is true because the Jasco agreement provides that if either party should develop a new chemical product using gas or petroleum as a raw material, that party should control the exploitation of the process who would be entitled to control under the division of fields agreement. As stated above, under the terms of the division of fields agreement, I. G. controlled all new chemical developments unless it was related to Standard's then business.

Standard and I. G. executed another agreement on November 9, 1929, referred to by the parties as the "four party agreement." (The other two parties to the agreement were Standard Oil of New Jersey (Delaware) and Standard-I. G. Co.) By this agreement I. G. assigned to S.-I. G., a patent licensing company owned by Standard and I. G., but controlled by Standard, the exclusive control of all present and future processes, both patented and unpatented for the manufacture of products in the oil industry, but only insofar as these processes were useful in the oil industry. Here again the surrender by I. G. was for the world outside of Germany.

S.-I. G., the patent licensing company, was incorporated under the laws of Delaware. Standard received 80 percent of its stock and I. G., 20 percent.

Both Standard and I. G. realized that inevitably there would arise border line cases, i. e., future processes would be developed that would fall both within and without the defined field as used in the November 1929 contract. So the parties agreed they would negotiate all future difficulties that might arise within the spirit of the basic agreements.

Another contract was entered into by Standard and I. G. on November 9, 1929, called the coordination agreement, and it states in very forceful language that the parties intended the contracts they had entered into on that day to last for a long period of time and to carry them through any eventuality. I quote a paragraph from this agreement:

"In the event the performance of these agreements or of any material provisions thereof by either party should be hereafter restrained or prevented by operation of any existing or future law, or the beneficial interest of either party be alienated to a substantial degree by operation of law or governmental authority, the parties should enter into new negotiations in the spirit of the present agreements and endeavor to adapt their relations to the changed conditions which have so arisen" (exhibit 1).

One other contract was entered into between the parties on November 9, 1929, and other corporations were formed to carry out the purposes of these two corporations. But the above will serve as a background for the story on Paraflow and the Methane Steam process.

PARAFLOW

In 1931 I. G. discovered a product that they called Paraflow. This is a synthetic oil product which was made by the chlorination of paraffin wax. Standard discovered that Paraflow, when mixed with natural wax-bearing oils, had the property of inhibiting the formation of paraffin wax crystals and thereby lowered the pour point of the oil, i. e. the temperature at which it ceases to flow freely. To illustrate its use, our mechanized military units will find oils treated with Paraflow useful during winter military operations as it will prevent, down to a certain temperature, the freezing of the lubricating oils.

The use patent for Paraflow was applied for and taken out in the United States by Standard in 1932 (Davis Patent, U. S. 1,815,022).

Standard-I. G. relationship in regard to pour point depressants.—After obtaining the use patent on this product, Standard claimed to I. G. that the exploitation of Paraflow came within the hydrocarbon field (its own domain) as defined

Digitized by Google

in the four party agreement between Standard and I. G. of November 9, 1929. Standard proposed that, in view of the fact that each party had patents, a special agreement be entered into. I. G. was somewhat reluctant to agree with this contention but, on April 1, 1932, after a good deal of bickering, a contract was entered into by S.-I. G., Standard Oil Development Co. (a 100-percent subsidiary of Standard), I. G. Farben, and Deutsch-Americanische Petroleum Gesellschaft, usually referred to as D. A. P. G. (Standard's German subsidiary). This contract stipulated:

(*a*) Standard Oil Development owns all patent rights for the use of Paraflow;

(*b*) For the world outside Germany, and including the United States, S.-I. G. may grant Development an exclusive license to make and sell Paraflow for use of the said product in admixture with lubricants to improve the fluidity at low temperatures only and to pay to S.-I. G. 17½ percent of the net royalty;

(*c*) In Germany Paraflow should be manufactured exclusively by I. G. and should be sold exclusively (for use as a pour point depressant) by D. A. P. G.;

(*d*) Development might not, without the consent of I. G., import Paraflow into Germany, nor could I. G. export Paraflow from Germany without Development's consent (exhibit 2).

Subsequently, I. G. developed a new pour point depressant which was called PVO (polyvinyl ester of whale oil fatty acids), and contended that this new product did not fall within the narrow field of the Paraflow agreement or the four party agreement. Therefore, it claimed the sole right to exploit PVO. Standard believed that PVO would be a very serious competitor to Paraflow and would offer (I quote from exhibit 3, a letter dated November 13, 1940, written by H. W. Fisher, manager of Standard's commercial department):

"* * * a price or potency competition which would greatly reduce the large profits from this enterprise."

While negotiations were going on in regard to PVO, the war had made it difficult or impossible for Standard to supply Paraflow to all of the European countries in its territory. Thus, Development authorized I. G. to supply Paraflow to Standard-Vacuum in Jugoslavia in December 1939, the division of the profits to be settled by agreement at a later date (exhibit 4). Again on October 3, 1940, Development cabled to I. G. permission to sell Paraflow or PVO in Budapest through D. A. P. G. subject to a later accounting (exhibit 5).

In November 1940, Standard realized that a tentative agreement, effective during the period of the war, had to be made with I. G. covering all pour point depressants. Thus, on November 15, 1940, H. W. Fisher wrote to Chemnyco, I. G.'s representative in the United States:

"* * * whether or not it is advisable at the present time to attempt to arrive at a permanent arrangement to replace the present Paraflow Agreement, a temporary arrangement, recognizing war conditions, is considered advisable by both parties, and the following suggestions are made by Development to I. G.:

"1. I. G. be permitted to sell Paraflow (but not PVO) in the countries specified below in which it is, at present, impossible for Development or its sales agents to effect deliveries from the United States: Albania, Belgium, Bulgaria, Czecho-Slovakia, Denmark, Danzig Free City, France (including Algeria and Tunis), Greece, Holland, Hungary, Italy, Jugoslavia, Lichtenstein, Norway, Poland, Roumania, San Marino, Switzerland, and Turkey.

"The principle being followed here is that since Development is unable to supply its customers directly, it is arranging to supply them temporarily from another available source. If Paraflow is supplied the status quo ante bellum is disturbed as little as possible which is very desirable in an interim arrangement. The sale of PVO in these territories would materially alter such a status quo" (exhibit 6).

In view of the above letter, it is without question the intent of both parties to consider their partnership merely suspended during the present hostilities. After the war, the parties undoubtedly intend to have an accounting, make the necessary financial adjustments, and then continue their unlawful agreement. This is succinctly stated by Mr. Fisher in a letter of August 14, 1941:

"Any distribution of these products (Paraflow, etc.) which is made by the I. G. is understood to be on a temporary basis only, because we are unable to supply" (exhibit 7).

Digitized by Google

Standard's activities in the domestic four point depressant field.—As to the United States, Standard, after executing the agreement with I. G. in 1932, immediately began to exploit Paraflow to its fullest extent. Standard adopted the policy of performing active research work and filing many patent applications in the Patent Office. This is brought out in a letter written by Dr. E. Lieber to Mr. J. A. Britton, both employees of Standard:

"It seems to me that our best hope in protecting our patent structure under the existing circumstances is intensive research work to uncover all the possible pour depressants and to literally 'flood' the patent office with our applications. There is no such thing as filing too many applications. There is, however, great danger in filing too few applications" (exhibit 8).

Standard on January 29, 1934, licensed Standard Oil of California to sell but not to produce, Paraflow in the States of Oregon, Washington, California, Idaho, Nevada, Arizona, New Mexico, Alaska, and Hawaii (exhibit 9); and the Carter Oil Co. to sell Paraflow in Oklahoma, Kansas, Nebraska, South Dakota, Colorado and parts of Iowa, Missouri, and Minnesota (exhibit 10). Standard sells Paraflow in the remaining territory of the United States. Every customer of Standard Oil of California, Carter Oil Co. and Standard signs a license and sales contract under which he agrees to take his entire requirements of pour point depressants from Development during a specified period, and to sell Paraflow only as a blend in oil.

Many products competitive to Paraflow have appeared on the market from time to time but Standard has been very successful in removing competition by agreements with the producers of such competitive products.

In 1932 Mid-Continent Petroleum Corporation secured certain patents for the pour point depressant field. Standard immediately entered into negotiations with Mid-Continent and signed an agreement on May 17, 1932, by the terms of which:

(*a*) Mid-Continent granted to Development an exclusive license under its patents for the life thereof, reserving for itself only operating rights:

(*b*) Development in turn agreed to supply Mid-Continent's requirements of Paraflow at a discount of 33⅓ percent from the current sales price;

(*c*) It was further agreed to give Mid-Continent 25 percent of the net profits from any sales of products covered by Mid-Continent's patents (exhibit 11).

Mid-Continent has not since the date of the agreement manufactured any pour point depressants, but has purchased all its requirements from development. Also development, through 1937, had not used the patents which it acquired from Mid-Continent (exhibit 12).

L. Sonneborn & Sons, Inc., developed a competitive product called Voltol. Development instituted infringement proceedings against Sonneborn, and the two companies thereupon entered into a agreement on April 9, 1934 (exhibit 13). The contract provided that after the submission of proof between the parties supporting their contention of priority, if Sonneborn would prevail, then Development would concede priority. That development knew Sonneborn had priority is indicated in a memorandum by R. T. Haslam, an employee of Standard, in which he stated, that there is "* * * no point in our submitting proof except that it supports the contention that we are really settling on the merits" (exhibit 14).

The effect of this arrangement has been to prevent Sonneborn from manufacturing Voltol and thereby it was removed from the market as a competitor in the pour point depressant field (exhibit 15).

In October 1936, Standard Oil of Indiana put on the market a pour point depressant which it called Pourex. Less than 2 years later, July 1, 1938, Development entered into an agreement with Indiana, whereby:

(*a*) Indiana agreed to pay Development $75,000;

(*b*) Indiana transferred to Development a nonexclusive, unlimited, fully paid-up license under Indiana's patents for pour point depressants with the right to license and sublicense; and

(*c*) Development, in turn, granted Indiana a nonexclusive fully paid-up license under Development's patents to manufacture and to use such depressants and to sell any oil containing a depressant, *but not to sell to others pour point depressants, as such* (exhibit 16).

Thereafter Indiana because of the agreement had to refrain from selling Pourex to other oil companies.

Digitized by Google

In 1936, Socony-Vacuum developed a product called Santopour which was the most serious threat Paraflow had faced in the pour depressant field. Socony had licensed Monsanto Chemical Co. to manufacture and sell the product. Santopour was a much more potent pour depressant than Paraflow, in some oils being twice as potent, and was sold for the same price as Paraflow. Standard considered Socony's action in selling a better product at the same price as Paraflow to be (I quote from exhibit 17) "merely price cutting."

In July 1936, Standard began negotiations with Socony's representatives (I quote from exhibit 18):

"On Wednesday, July 22nd, Mr. Howard, Mr. H. W. Fisher, and the writer called on Dr. Rather and Mr. Lamont of Socony-Vacuum in reference to the Paraflow-Santopour situation.

"Mr. Howard told them that we did not regard their act of bringing out this material as a friendly one and thought that they should have raised this subject with us. He said that he had been informed that our product could be made more cheaply than theirs and he felt that they had no right whatever to put a basically higher-priced material on the market when the only result obtained would be forcing us to reduce the price of our material, when, in fact, we could finally reduce the price to such a point that they could not stay in the business at all. He said that he felt that this was only a question of reputable business practice and that he was very much surprised that they would take any other attitude.

"He further stated that that was the attitude of the New Jersey company and that the only reason why we kept out of certain fields such as paint, was because we did not wish to come into a field that Socony had already occupied."

On August 27, 1936, Standard and Socony executives met and agreed that during the negotiations neither party would cut prices, and Standard would be permitted to bring the potency of Paraflow up to that of Santopour (exhibit 19).

Pending further negotiations H. W. Fisher, of Standard's commercial department, wrote a memorandum dated October 15, 1936, in which he suggested his views as to the handling of Paraflow-Santopour marketing:

"Due to the widespread publicity on Santopour and the claims of considerably greater potency than Paraflow, many pour depressant customers will resent the destruction of competition. They will attribute their loss of substantial potential savings to 'big business.'

"If Paraflow and Santopour are both to be marketed without loss of total income it is apparent that Santopour would have to be adjusted to the same cost per unit of pour reduction as Paraflow. This could be done by either making a substantial increase in the price of Santopour or diluting it to a considerable extent. Either chance would remove any great differences in superiority of one product versus the other, and the marketing of both would simply be a question of one selling organization competing with another with equivalent products selling at the same price.

"If one organization sold both products, a change in price or potency of Santopour would still have to be made as outlined above, in order to preserve the present volume of total business. While we would then be able to offer the customer two products, one of which might be slightly better for his use than the other, the difference would in any case be small, and in the event that we should decide to manufacture Paraflow by the Monsanto process it would be nil. We would have to tell a rather embarrassing story to explain the marked changed in either price or potency of Santopour, and the real reason for the change would be obvious to the trade.

"Our conclusion is, therefore, that the best policy is to retire Santopour as quickly and as quietly as possible, and to market only Paraflow of present potency. We must of course continue to supply Santopour of present potency under the contracts already executed by Monsanto. In order to minimize the loss of good will resulting from again creating a monopoly in the pour depressant field we propose a reduction in the price of Paraflow from the present price (established July 1) of $2.00 in tank cars, $2.05 in light iron barrels, to $1.75 in tank cars, $1.80 in barrels, all f. o. b. Bayonne.

"It is perhaps reasonable to expect that a combination of the Santopour and Paraflow processes will enable us to save at least a part of the proposed price cut. The lower price will bring some new business in the long run" (exhibit 20).

One of the chief obstacles for complete agreement between Monsanto and Socony on the one side, and Standard on the other, was the fact that Standard

Digitized by Google

insisted on paying royalties to I. G., thereby reducing the amounts payable to Monsanto and Socony; whereas, if Standard operated under Socony's patents no such payments would be required. I quote from a letter dated January 18, 1937, from W. F. Burt to J. A. Brown, both of Socony-Vacuum, concerning a conference with Standard:

"I called attention to the fact that if Monsanto, under our patents, manufactured a product for sale to Jersey that Jersey could in all probability be relieved of paying royalty to I. G. Farbenindustrie but the answer came back that the Jersey Company had so many other connections with I. G. F. that they wanted to continue to pay this royalty" (exhibit 21).

Mr. Brown in conveying this information to Orville Hardin, director of Standard, stated:

"When the attempt was made to determine the cheapest manufacture, complications came into the picture, and in particular Mr. Burt was informed that Jersey did not want to be relieved of paying royalty to the I. G. Farbenindustrie because of other connections. Naturally, we do not want to be burdened in any case with paying what we consider to be an unnecessary royalty and aside from this our people are convinced that when all the technical facts are properly appraised and understood Monsanto can demonstrate their ability to manufacture cheaper than either your company or ours entirely aside from the royalty question. Because of Standard Development Company's insistence on royalty and manufacture by themselves of the bulk of the product without regard to cost of manufacture, the negotiators finally arrived at the memorandum which you received" (exhibit 22).

In October 1936, F. A. Howard wrote a memorandum of agreement reached by Socony and Standard, whereby Monsanto assigned its Santopour business to Development, and Development agreed to pay Socony 35 percent of the profit on pour point depressants sold to persons other than Socony and Standard. Subsequently, on the advise of counsel that a more valid reason for combining the business of the two groups should be shown on the face of the agreement, another agreement was substituted for the above in which the alleged settlement was based upon the infringement of certain patents.

Messrs. Howard and Currie then drew two agreements primarily based on infringement of Standard's Davis patent. A penciled memorandum by W. E. Currie to H. W. Fisher, both of Standard, dated October 30, 1936, states in regard to the two drafts:

"These look as if we are trying to 'rub it in' on Mr. Lamont [of Socony] as to infringement. The only excuse is that our outside counsel advised this as the only way to form a basis for an agreement which is sound under the antitrust laws" (exhibit 23).

Under the agreement as finally executed on January 1, 1938, the manufacturing was divided between Development and Monsanto; Development, however, remained in complete control of the pour point depressant business. Development granted to Socony and Monsanto a nonexclusive license to make pour point depressants, but the amount that could be sold by them was limited to 20 percent of the aggregate amount of pour point depressants sold under Development's patents by all of the parties during any one year. Monsanto and Socony agreed to pay Development 3 percent of their gross receipts from their sales under Development's patents and 30 percent of the net sales of any excess. The agreement fixed the potency, specifications, and the prices under which Monsanto and Socony were permitted to sell pour point depressants: Development on its part agreed to sell pour point depressants on the same terms as it fixed for Monsanto. The agreement was to continue in force until on or about July 14, 1948 (exhibit 24).

Since the execution of the agreement Monsanto has been particularly skittish about the antitrust laws. On June 7, 1938, Mr. Joseph R. Mares, of Monsanto, wrote to Mr. Fisher and, after referring to a recent antitrust decision, stated:

"It occurs to me, in view of the importance that both Monsanto and Standard Development attached to the Anti-Trust legislation in connection with the Pour Depressant contract, that your legal staff has or is considering this situation" (exhibit 25).

Again, on June 4, 1940, Mr. Mares referred the Consent Decree filed in the National Container Association case to Standard (exhibit 26). To this letter Mr. R. C. Wilson of Standard replied:

"I think that our case may be distinguished from the container case in that our products are covered by patents. Irrespective of that fact, I believe that consid-

Digitized by Google

erable trouble in the future may be avoided if the Santopour contract was examined in the light of the Supreme Court's decision in the Madison and the Ethyl Gasoline antitrust suits" (exhibit 27).

Also, when the potency of Santopour was reduced, such a disturbance was made that Development was willing not to insist upon the full reduction agreed to (exhibit 28), and the high royalty rate of 30 percent very effectively stopped sales by Monsanto in excess of its 20 percent quota. I quote from a letter dated February 14, 1940:

"Mr. Mares of Monsanto * * * stated that his company would prefer more leeway in making external sales. It seems that the high royalty rate of 30% has prevented Monsanto from adopting a vigorous sales program. Mr. Mares stated that on a few occasions some prospective customer was unable to obtain Santopour because the quota was fulfilled prior to receipt of the order. Mr. Mares' viewpoint is that this is an unhealthy situation from an antitrust standpoint and suggests that the agreement be amended so that if Monsanto exceeds its quota in any one year, then the amount of the excess will be deducted from the amount of pour depressants of the phenolic type purchasable by Development from Monsanto under the agreement" (exhibit 29).

I also quote from a memorandum prepared by Mr. Wilson of Standard, dated February 20, 1940:

"I conferred with Dallas Lamont about the suggestion Mr. Mares made concerning the amendment to the Monsanto-Development pour depressant agreement. I told Mr. Lamont that the high royalty rate of 30% and the obligation of Development to purchase pour depressants of the phenolic type were inserted by Messrs. Davis and Clark in order to justify the contract from an antitrust standpoint. Mr. Lamont said that he did not think the suggestion would improve the agreement from a legal or antitrust standpoint, although he recognized some danger in the inability of Monsanto to supply customers when their quota has been fulfilled (exhibit 30).

From the above evidence, I believe this committee will agree with the statement made in May 1941 by an employee of Standard's Paraflow Division.

"Up to the present time the business of this Department has been considerably favored by a lack of competition on its principal products" (exhibit 31).

What financial benefits did Standard receive from this so-called "lack of competition"? Within 2 years after Paraflow's introduction into the United States in the latter part of 1931, about 75 percent of the nationally branded lubricating oils used in this country were being treated with Paraflow to lower their pour point (exhibit 32). In 1939 about 90 percent of the refineries using Pennsylvania crudes, which contain paraffine, employed Paraflow.

In November 1939 a Standard official wrote:

"Sales of Paraflow were initiated in 1931 with sales of 35,000 gallons for the year. It rose to approximately one-half million gallons in 1933, and since then there has been a steady rise in the use of Paraflow so that we are able to estimate that the year 1939 will end with a million gallons consumed" (exhibit 33).

In June 1941 "sales for five months exceeded last year's sales for seven months" (exhibit 34).

Between 1931 and July 1937 the price of Paraflow fell from $3 a gallon to $1.90 a gallon. Since July 1937 the price has remained unchanged. There follow figures on Paraflow sales during 1939 and 1940 (exhibit 35):

	1939	1940
Quantity sold.....gallons..	813,890½	782,889½
Amount of sales	$2,149,097.45	$2,103,814.40
Profit before royalty	1,350,343.23	1,440,537.62
Royalty (17½ percent to S. I. G.)	236,310.07	252,094.08
Net profit	1,114,033.16	1,188,443.54

It is to be borne in mind that out of the 17½ percent royalty paid to S. I. G., Standard was entitled to 80 percent of this amount under the basic agreement of 1929. In other words, out of the $236,310.07 paid S. I. G. in 1939 and the $252,094.08 in 1940, Standard received back $189,048.06 and $201,675.26, respectively. Thus it is seen that the amount of sales in 1939 were $2,149,097.45 and Standard received a profit of $1,303,081.22 and in 1940 out of sales totaling $2,103,814.40, Standard received $1,390,118.80. Therefore, Standard during 1939

Digitized by Google

and 1940 received a net profit of more than 50 percent of sales on its Paraflow business.

On February 20, 1940, R. C. Wilson of Standard wrote a memorandum concerning a conference he had with Mr. Lamont, of Socony-Vacuum (I quote from exhibit 30, which has already been introduced):

"Mr. Lamont feared that one or more of Monsanto's customers might complain to Washington and thereby instigate an investigation of the pour depressant business."

Mr. Lamont's fears were justified because, as this committee knows, an investigation of the pour point depressant business was carried on by the Antitrust Division of the Department of Justice and a consent decree was entered in Newark, N. J. on March 25, 1942. Under this decree the agreements that Standard executed with I. G., Mid-Continent, Sonneborn, and the Socony-Vacuum (discussed supra) were adjudged unlawful, and Standard was enjoined and restrained from the further performance of any of their provisions. Also, all Paraflow patents held by S. I. G., which includes the patents of both Standard and I. G., are required to be licensed to the public royalty free during the present emergency and reasonable royalty rates are to be charged thereafter.

METHANE STEAM PROCESS

This is a commercial process used to manufacture hydrogen from natural gas (methane). The hydrogen produced can in turn be used to make a variety of products, such as synthetic ammonia for conversion into explosives or fertilizers; hydrogenated food fats, an important use for the Germans; and gasoline and crude oil by combining the hydrogen with petroleum, the so-called hydrogenation process, one of the first methods for making aviation gasoline.

Standard-I. G. relations.—As construed by Standard and I. G., the four party and division of fields agreements of November 9, 1929, gave Standard exclusive licensing rights on I. G.'s methane steam process, as well as its own methane steam process, insofar as any prospective licensee intended to use the hydrogen produced to make commodities generally sold in the oil industry (e. g., gasoline). Insofar as the licensee desired to use the hydrogen produced to make a chemical product, such as synthetic ammonia, control of the exploitation of the methane steam process was left with I. G.

On the records of the United States Patent Office, I. G. appeared as record title holder of patents originating with it, and Standard appeared as the holder to its processes. As of 1940 I. G. held 18 United States patents covering aspects of hydrogen manufacture and Standard held 27 United States patents in the same field. Of these 45 patents, 4 of I. G.'s patents were considered to be necessary to practice the methane steam process—1,921,856, issued August 8 1933; 1,934,836, issued November 14, 1933; 2,038,566, issued April 28, 1936; and 2,083,795, issued June 15, 1937 (exhibit 36).

Since the methane steam process was extremely important and of commercial value to oil-chemical refining, it was the subject of many discussions between Standard and I. G. during the years since the basic agreements. On December 15, 1937, Standard agreed with I. G. to pass to I. G. all of Standard's "know how" concerning the manufacture of hydrogen, provided that I. G. would use its knowledge only in connection with hydrogen plants which were intended to be employed for the synthesis of ammonia and other nitrogen derivatives. Standard further required that I. G. would endeavor to obtain and pass back to Standard, for Standard's use only, all of the "know how" that was acquired by I. G. from any licensee. As late as 1940 I. G. claimed that this agreement had been intended to include a provision granting to I. G. licensing rights on Standard's methane steam patents, insofar as the license was to cover a field outside the field of oil company operations; that is, the field reserved to I. G. under the 1929 agreements.

On December 18, 1940, Dr. Mueller, of Chemnyco, I. G.'s representative in this country, wrote to Mr. Currie, of Standard:

"The basic idea of the understanding between Standard Oil Development Company and I. G. regarding the licensing of the hydrogen process for the ammonia synthesis was, we believe, to have I. G. utilize this process in the field referred to, at its discretion; it was for this reason that the 1937 agreement wa sconcluded" (exhibit 37).

Standard must have agreed with this interpretation because on February 10, 1941, an agreement was prepared by Standard along the lines suggested above by Dr. Mueller. By the terms of this contract, Standard granted to I. G.: "* * *

Digitized by Google

the right to grant licenses under United States patents and patent applications owned by Standard Oil Development Company and covering the manufacture of hydrogen by the methane steam process * * * for use in ammonia synthesis" (exhibit 38).

This agreement was accepted by I. G. in September 1941, and on September 4, 1941, W. E. Currie, of Standard, wrote to Dr. Hockschwender, of Chemnyco (exhibit 39), "the agreement may now be considered complete."

Under the terms of the above contract it is important to emphasize that Standard, this late in 1941, did not receive from I. G. the right to license I. G.'s methane steam patents for the production of synthetic ammonia. In other words, as recent as September 1941, only 3 months before Pearl Harbor, I. G. received from Standard the exclusive right to license Standard's methane steam patents in the ammonia synthesis field, along with its own United States patents; but Standard limited itself in the right to license these patents to the hydrocarbon field, a right Standard had by contract since 1929. Furthermore, Standard knew at the time of these negotiations with I. G. that the Atlas Powder Co. and many other companies were seeking licenses to use the methane steam process for use in the production of explosives.

The assignment to S.-I. G.—On September 25, 1939, the month war was declared by Germany, Mr. Frank A. Howard, president of Standard Oil Development Co., met Dr. Ringer, of I. G., at The Hague, Holland. Mr. Howard reported to his board of directors in a letter dated October 12, 1939, in which he stated:

"I was able to keep my appointments in Holland, where I had three days of discussion with the representatives of the I. G. They delivered to me assignments of some 2,000 foreign patents and we did our best to work out complete plans for a modus vivendi which would operate through the terms of the war, whether or not the U. S. came in. All of the arrangements could not be completed, but it is hoped that enough has been done to permit closing the most important uncompleted points by cable. It is difficult to visualize as yet just how successful we shall be in maintaining our relations through this period without personal contacts" (exhibit 40).

Among these 2,000 patent assignments obtained from I. G. by Mr. Howard were the methane steam patents.

On September 1, 1939, the same day war was declared and only 25 days before Mr. Howard met Dr. Ringer, Standard wired I. G.:

"We are interested in acquiring your capital stock interest in Standard-I. G. and are prepared to pay $20,000 for same stop please cable whether you wish to sell at that price" (exhibit 41).

On September 5 I. G. answered:

"Refer to your cable to Dr. H. S. (Dr. Schmitz) we hereby sell to you our capital stock interest in Standard-I. G. at the price offered" (exhibit 42).

Why did Standard purchase I. G.'s 20 percent stock interest? Mr. W. Schaeffer, assistant comptroller of Standard, in a letter dated September 8, 1939, to F. H. Bedford, Jr., a member of Standard's board of directors, gave the reason as follows:

"Of course, what we have in mind is protecting this minority interest (I. G.'s) in the event of war between ourselves and Germany as it would certainly be very undesirable to have this 20% interest in Standard-I. G. pass to an Alien Property Custodian who might sell it to an unfriendly interest" (exhibit 43).

The methane steam patent assignments, delivered to Mr. Howard by I. G., were assigned to S.-I. G.

Standard was thus in a dilemma when Atlas Powder Co. early in 1940 applied for a license to operate under the methane steam patents. I quote from a letter dated June 10, 1940, from Mr. Fisher to Mr. Currie, both employees of Standard:

"* * * I advised Chemnyco that I was somewhat worried as to who the licensing agent should be and that before any license was issued I felt that you should render an opinion. * * * My worry in this connection arose as follows:

"If Hydro Patents is the assignee of patents covering hydrogen manufacture, could any doubt be cast on Hydro Patents' title if we subsequently were at war with Germany and it then became known that I. G. had granted a license under our patents in the ammonia field" (exhibit 44).

To this letter Mr. Currie replied:

"* * * These patents are now assigned to I. G. on the records of the United States Patent Office. We have, however, in our files, an assignment of these patents from I. G. to Standard-I. G., bearing date in September 1939. Ac-

Digitized by Google

cordingly, if I. G. now issues a license to Atlas Powder Company and we subsequently file our assignment, it will be apparent to any one who investigates the matter that I. G. granted a license under the patents after title had passed to Standard-I. G.

"It is unlikely that we shall file the assignments from I. G. to Standard-I. G., but if we do we can always refer back to the original agreement of November 9, 1929, from which it will be clear that our rights under the patents for hydrogen manufacture apply only to the making of specified petroleum products.

"Mr. Joslin and I agreed that there would be no harm in I. G. granting the license to Atlas Powder Company. If we record the assignment from I. G. to Standard-I. G., we should probably then execute an agreement authorizing I. G. to grant this license as of the date that it was granted. If any question of taking over the patents by the Government arises, it would undoubtedly be necessary to show the whole contract arrangement and our title to the patents, insofar as they relate to the hydrocarbon field, could be easily established as of the date of their issuance, or earlier * * *" (exhibit 45).

As stated in the above letter by Mr. Currie, these patents which were assigned to S.-I. G. in September 1939 were on record in the United States Patent Office as belonging to I. G. So long as the record title holder of these patents was I. G. Standard could refer all applicants for licenses under the methane steam process for use in ammonia synthesis to I. G.; as Standard was obligated to do under its agreements.

I. G.'s position on use of methane steam process in this country.—From the above it is obvious that Standard was not interested in the methane steam process in the production of any product that did not fall within the oil industry. Therefore, it left with I. G. the complete control over the production of hydrogen used in the production of synthetic ammonia. Since this chemical is basic to the production of explosives, I. G. never did enter the synthetic ammonia field in the United States. On the contrary, it carried out a policy of retarding the use of this process by American industries. This policy of Standard, leaving the control of this process with I. G., played right into the hands of I. G. in that I. G. was not interested in the royalty received from licensing this process but was more interested in retarding our building up this industry.

As early as 1933 the Hercules Powder Co. sought the I. G. rights for an ammonia plant in this country. I. G. turned down the request, pleading that "* * * because of our other nitrogen interest we were not in a position to permit your firm to use our process and experience for the productinn of hydrogen and ammonia synthesis" (exhibit 46).

Hercules renewed its request for a license in April 1936, and I. G. took the matter up with du Pont. Chemnyco reported to I. G.:

"Dupont takes the position that I. G. is free to enter into an agreement with Hercules and that du Pont could not be sore at I. G. if I. G. entered into such an agreement. Wardensburg (head of du Pont's ammonia department), however, expresses the opinion that in order to reach the understanding between du Pont and I. G. which he and other du Pont executives desire, it would be better if I. G. were not burdened by commitments in the United States" (exhibit 47).

In reply to the above communication, I. G. cabled Chemnyco, "* * * in view of du Pont's position, we think it is expedient to reject the Hercules proposal" (exhibit 48).

Accordingly, I. G. wrote to Hercules Powder Co., "* * * we have again reach3ed the conclusion that, because of our other interests in the nitrogen field, we are not in a position to put at your disposal the experience you desire" (exhibit 49).

This incident was closed when I. G. reported back to du Pont that Hercules had been stopped once more. Chemnyco reported to I. G. on June 11, 1936, "* * * I beg to advise you that I have communicated your position to Mr. Wardenburg over the telephone. Mr. Wardenburg thanked me very much and remarked that du Pont appreciated I. G.'s decision in this matter" (exhibit 50).

The defense program and the European war greatly increased the demand for synthetic ammonia in this country. The Atlas Powder Co. sought licenses under the I. G. process in the latter part of 1939. In connection with the Atlas request for a license Chemnyco wrote to I. G. on December 9, 1939, that, "the projection of Atlas Powder Company is analogous to the projection of Hercules. It will be carried out irrespective of whether or not you will give Atlas a license and technical advice" (exhibit 51).

Digitized by Google

Chemnyco then asks a question of I. G. which reveals what the I. G. policy had been up to that time:

"We do not know whether under these circumstances you would still refuse to promote in any way the building of basic nitrogen plants in the United States."

Since further delay was no longer within its power, I. G. continued its negotiations with Atlas and reopened negotiations with Hercules, although Hercules had been turned down in 1933 and 1936 on the ground that I. G. had commitments with du Pont. On June 28, 1940, an agreement with Hercules was effected covering the ammonia process (exhibit 52).

After the December 1939 letter, negotiations with Atlas also made progress, and on January 5, 1940, Atlas was granted the permission to inspect the operation of Standard's plants which used the same process (exhibit 53).

The negotiations between Atlas and I. G., however, were ended abruptly by I. G. On June 9, 1940, I. G. cabled Chemnyco: "For special reasons we are compelled to discontinue negotiations with Atlas" (exhibit 54).

On June 11, 1940, Chemnyco wrote to Atlas: "* * * I. G., for the time being, are not in a position to grant a license. To their regret they are also not able to indicate at what future time negotiations on this matter might possibly be resumed" (exhibit 55).

This abrupt break in the negotiations was occasioned by an item which had appeared in the Chemical Trade Journal on February 16, 1940:

"Explosives for the Allies: A factory in the U. S. A.—The president of the Atlas Powder company, Wilmington, Del., announced in New York on February 8 that the British government had advanced money to his company to build an explosives plant, of which the total output would go to the British and French armies. The work would begin immediately, and it was expected that the plant would be in operation within six months" (exhibit 56).

Referring to this statement, Chemnyco cabled I. G. on July 8, 1940:

"Methane Steam Process your cable July sixth information given Chemical Trade Journal correct but please consider that plant mentioned therein will be located great distance from Missouri where ammonia plant is to be erected stop As explained in our letter June 19 and our cable July third party assures ammonia produced Missouri plant will be used only in manufacturing commercial explosives and fertilizer former being used exclusively in middle west mining operations stop" (exhibit 57).

Clearly, I. G. broke off negotiations because it feared that Atlas would use its process to make munitions for the British and French. Atlas, however, assured Chemnyco that such was not the case and tried to soothe I. G. with proof that it was not really cooperating with the British and French. As related by Chemnyco to I. G. in a letter of June 19, 1940:

"Mr. Power (Atlas Powder Company) at a recent conference mentioned the agreement by which Dr. Duisberg has talked to you * * * (mentioning the arrangement to build, at the expense of the British and French, plants to produce and fill their orders for munitions) and called our attention to the fact that other American firms, for instance duPont, had likewise entered into an agreement of this sort. He added that such agreements made matters more difficult for those who give orders" (exhibit 58).

This last point was elaborated upon by Chemnyco in its letter of July 23, 1940, to I. G.:

"Atlas refused to carry out orders for the British Government unless this government was willing to pay for the building of plants which Atlas had to erect for this purpose. Atlas pointed out that this attitude on its part made matters considerably more difficult for the British Government and that the British Government would have preferred it if Atlas had been willing to carry out this order without attaching this condition, in which case the papers would not have mentioned this transaction" (exhibit 59).

Atlas's promise to use the process for commercial explosives only, even though the license was to be obtained under I. G.'s United States patents, reveals how far I. G. has been able to obstruct our defense efforts. Manifestly, Atlas and Hercules would not have sought the I. G. process if other available processes were equally as good. Chemnyco's letter of July 23, 1940, to I. G. indicates that the I. G. process is rated as the most desirable by the industry in this country. I quote from exhibit 59, introduced supra:

"To judge by the opinions which interested parties have expressed to us about your process for the manufacture of nitrogen from methane, there seems to be no doubt that your process, as compared with competing processes, is the best, and the most economical."

Digitized by Google

The value of I. G.'s process is also brought out in a memorandum by Mr. Currie of Standard, written in March, 1941:

"I. G. believes that there is no substantial competition in this field, as the steam-iron process is said not to be competitive with the methane-steam process" (exhibit 60).

This superior process has been under United States patents at least since 1933 when Hercules was first refused a license under them, yet it was kept out of the United States until 1940.

In this same letter of July 23, 1940 (introduced as exhibit 59 supra), urging I. G. to grant Atlas and others a license under its patents on the ground that "by refusing to grant such licenses you will not seriously hamper a nitrogen program that may be devised by the U. S. A. Government; for, on the one hand, it is possible to base new ammonia plants entirely or primarily on coal, on the other hand, it might be possible to use for the production of hydrogen from methane, the process which the Shell Union Oil Corporation is using in its nitrogen plant in California."

Only as a secondary inducement does Chemnyco mention that—

"It is obvious that you would lose considerable income from license fees and would, moreover, lose opportunities for the further development of your business connections in this country."

As it became more apparent to the Germans that Britain could not be conquered quickly and decisively and that the United States for all practical purposes was rapidly assuming the role of Britain's ally, I. G. became even more wary of permitting the use of its processes in the United States. Even though Chemnyco, I. G.'s United States representative, urged a license for Atlas in June and July, of 1940, as late as 1941 no license had yet been issued to that company. The pressure for licenses in this country was so heavy that Standard finally wrote to Hochschwender, of Chemnyco, on March 28, 1941, that—

"I believe it would be very desirable to secure from I. G. a statement of its position as to the licensing of the hydrogen manufacturing patents for the production of ammonia. If I. G. is not willing to grant such a license in general terms, it might be put on the basis of plants having specified capacities. If you approve, we shall be obliged if you will find out what I. G.'s position is on this matter" (exhibit 60).

On April 11, 1941, Hochschwender told W. E. Currie of Standard:

"On April 11th Dr. Hochschwender told me that he felt sure I. G. would not agree to permit the granting of licenses under its hydrogen manufacturing patents, except with respect to particular installations about which it had been advised and of which it approved. Accordingly, he said he thought it better not pass on to I. G. the suggestion in our letter of March 28, 1942" (exhibit 61).

I. G. is thus trying to keep sterile the processes which it has under United States patents, insofar as they can be useful in the defense program, regardless of the profits to be derived from the licensing of this process.

The history of the use of the methane steam process in this country shows that I. G. operated first in the interest of Germany's political and military objectives and only secondary for the benefits of its own business interests. It used this secondary business reason as a clever disguise for its primary nationalistic purposes. Thus, ostensibly, Hercules was refused an ammonia process license in 1933 and 1936 because of the du Pont-I. G. relationship, but the fundamental motive was to keep at a minimum the production of this essential raw material for munitions. Du Pont, with its large ammonia plant, was not enthusiastic about pushing the erection of added capacity operating under a superior process. Also, Standard was never in the ammonia business and, therefore, was willing to turn the methane steam process over to I. G. for exploitation. The net result is that I. G. was able to postpone the use of its processes here as long as it desired and yet always be able to hide its real purpose behind agreements with an American company.

Under the consent decree entered in Newark, N. J., the Methane steam patents of both Standard and I. G. were opened to the public royalty-free during the duration of the emergency.

CONCLUSION

The exploitation of Paraflow and the methane steam process by Standard and I. G. are good examples of how the cartel arrangement was to the advantage of both parties concerned and to the detriment of the public. Standard was

Digitized by Google

interested in the exploitation of Paraflow and, therefore, created a monopoly in this country and received large profits for its unlawful acts. On the other hand, Standard was not interested in the exploitation of the methane steam process for the production of synthetic ammonia and left the control of this process to the discretion of I. G. Unlike Standard, I. G. was not interested in obtaining large royalties from this process because it served I. G.'s interests more by preventing American industry from getting the use of this vital process during the war emergency.

EXHIBIT No. 136

THE DYESTUFFS CARTEL

Statement by Charles D. Pack

PRELIMINARY STATEMENT

A world-wide cartel to which the principal dyestuff manufacturers of Europe have been parties, and with which certain American companies have been associated, characterizes the international organization of the dyestuffs industry. The cartel arrangements have had a profound influence on trade and commerce in the United States, not only through participation by American manufacturers: but also through the presence of companies controlled by members of the cartel in this country, and by the adoption of cartel practices in the domestic market. The results of the practices engaged in have been the following: (1) Restraint of free competition in the manufacture and sale of dyestuffs in the United States, (2) restriction of exports from and imports into the United States, (3) allocation of world markets.

The original parties to the European Dye Cartel organized in 1927 were I. G. Farbenindustrie of Germany, three Swiss companies—Ciba, Sandoz, and Geigy—who were coordinating their own operation under a so-called community of interests agreement, and Kuhlman, the leading French dyestuff manufacturer. In 1931, Imperial Chemical Industries, Ltd., of England, became a member.

I. G. Farben has controlled in this country General Aniline & Film Corporation; three Swiss companies each have representatives in the United States; two other major American manufacturers—E. I. du Pont de Nemours & Co., and Allied Chemical & Dye Corporation—have had far-reaching agreements with the cartel respecting various world markets. These companies dominate more than 80 percent of the domestic market in dyestuffs; with the addition of American Cyanamid Co., the group total rises almost to 90 percent.

In this statement I shall trace briefly the history and importance of the dyestuff industry, indicating how Germany achieved its position of dominance, the development of a domestic industry in the United States during the war and the apparent termination of dependence on Germany, the reentry of foreign interests following the war, the movement in Europe toward consolidation and cartelization with its impact on the domestic pattern; finally, a summary of the organization and position of the industry in this country at the present time.

I. BACKGROUND

1. *Importance of dyestuff industry.*—The manufacture of dyestuffs is a strategic branch of the chemical industry. Dyestuffs are used principally to color textiles, paints, papers, leather, and other miscellaneous substances. Formerly they were obtained from natural products such as roots and leaves of certain plants, but in the middle of the last century scientists in Europe discovered that dyestuffs could be produced synthetically from certain organic chemicals known as intermediates, which are derived from coal tar. Although the initial developments were worked out in England and France, more rapid scientific and commercial advance took place in Germany where, in the last decades of the century, the industry of synthetic-dyestuff manufacture made rapid strides.

The complexity of the dyestuff industry is illustrated by a chart which I introduce as exhibit 1. Practically all finished dyestuffs trace their origin to coal tar, one of the byproducts from the production of coke. From the processing of this coal tar, the basic crudes—benzene, toluene, naphthalene, and anthra-

Digitized by Google

cene—are obtained, and from these coal tar crudes are prepared the 200 to 300 intermediates from which hundreds of colors are made. The final dyestuffs product is the result of further refinement and synthesis with other intermediates or so-called heavy chemicals, such as sulfuric or nitric acid. By slightly altering one of the steps in this process, or by diversion from use in producing dyestuffs, many of these intermediates may be utilized in the manufacture of explosives and related products. Furthermore, plants producing dyestuffs intermediates often may be converted with facility to the production of chemicals vitally essential in war time. Recognition of this fact was another reason for the impetus, often Government aided, given to the dye industry in Germany, and another respect in which the United States and its allies found themselves retarded during the last war which experience proved conclusively that an organic chemical industry is the basis of any scheme of national preparedness. The cartel movement in Germany was fostered by the development of the dye industry and early in the present century the tentacles of the German manufacturers began to reach out for new fields of conquest. By virtue of the policy of dumping dyestuffs abroad, and also through the myriad of patents taken out in other countries, including the United States, the development of the dyestuffs industry outside of Germany was considerably retarded. Switzerland constitutes an exception; then despite dependence on outside sources for raw materials, through skillful research, development paralleled on a smaller scale that of Germany.

Before the World War, about 75 percent of the world's supply of dyes and nearly all intermediates were made in Germany. The United States produced only 10 percent of its consumption of dyes and imported about 90 percent of the intermediates used in this production, the total value of which was less than $3,000,000. In 1914, there were seven establishments in the United States making coal tar products, employing 528 persons. These factories were little more than assembling plants, since they were all almost entirely dependent on imported intermediates.

Nor did the tariff offer substantial encouragement to domestic industry, for, although there was an ad valorem duty of 30 percent on most finished products, certain important colors were duty free, and the rates on intermediates were sufficiently low for German agencies to import them and perform the final steps in production in this country.

The great bulk of dyes imported from Germany were produced by six large manufacturing houses, Bayer, Badische, Berlin Anilin Works, Cassella, Hoechst, and Kalle, all of whom had well organized sales branches in this country.

2. *Effect of World War I.*—The war gave tremendous impetus to independent production in countries theretofore dependent on Germany. In 1918 there were 78 firms which were making dyestuff in the United States; by 1919 the number of dyestuff manufacturers had increased to 90 and their production was valued at approximately $67,500,000.

Certain additional stimuli accelerated domestic progress. The Revenue Act of 1916 revised upward the tariff on dyes and other coal-tar products, including intermediates, and provided that if at the end of 5 years the American industry had not expanded so as to produce 60 percent in value of the domestic consumption, the specific duties should be removed. In any event, the duty should be lowered 20 percent each year after the expiration of the 5-year period. More important was passage of the Trading With the Enemy Act in October 1917, which empowered the Alien Property Custodian, appointed pursuant to this statute, to license domestic corporations to manufacture and sell products covered by enemy-owned patents. An amendment to this act, November 4, 1918, empowered the custodian to seize, hold, and administer such patents, copyrights, applications therefor, etc. Accordingly, title to all patents held in the name of alien enemy citizens or corporations was seized by the custodian; and the disruption and disorganization of the German agencies in this country appeared now to be complete.

3. *Early post-war developments.*—At the close of the war German manufacturers sought to regain their lost markets in countries which had established independent industries and also to reestablish their markets in nonproducing countries which had been lost to other suppliers during the war. Swiss manufacturers, largely dependent on export trade, had greatly expanded that trade during the war, owing to the absence of German competition. In the post-war period the Swiss undertook to consolidate this position. These countries which had established dyestuff industries during the war, particularly the

Digitized by Google

United States and England, endeavored to protect their infant industries by subsidy, tariffs, and similar measures.

The annual message of President Wilson to Congress delivered May 20, 1919, contained the following statement:

"Nevertheless there are parts of our tariff system which need prompt attention. The experiences of the war have made it plain that in some cases too great reliance on foreign supply is dangerous, and that in determining certain parts of our tariff policy domestic considerations must be borne in mind which are political as well as economic.

"Among the industries to which special consideration should be given is that of the manufacture of dyestuffs and related chemicals. Our complete dependence upon German supplies before the war made the interruption of trade a cause of exceptional economic disturbance. The close relation between the manufacture of dyestuffs on the one hand and of explosives and poisonous gases on the other, moreover, has given the industry an exceptional significance and value.

"Although the United States will gladly and unhesitatingly join in the program of international disarmament, it will, nevertheless, be a policy of obvious prudence to make certain of the successful maintenance of many strong and well equipped chemical plants. German chemical industry, with which we will be brought into competition, was and may well be again a thoroughly knit monopoly, capable of exercising a competition of a peculiarly insidious and dangerous kind."

As a result of considerable agitation for exclusion, the Dye and Chemical Control Act of 1921, with subsequent amendments, excluded dyestuffs and all other coal-tar derivatives from the United States unless it was determined that no satisfactory substitute was obtainable in this country in sufficient quantities and at reasonable terms as to quality, price, and delivery, and was required for consumption by a domestic consumer within 6 months after its receipt here. The Tariff Act of 1922, which superseded this measure, provided that the ad valorem portion of the rates on all dutiable coal-tar products should be based on the American selling price of any similar competitive article produced in the United States; this duty was fixed for a period of 2 years at 55 percent for intermediates plus 7 cents per pound and at 60 percent for dyestuffs plus 7 cents per pound; thereafter the ad valorem rates were set at 40 percent and 46 percent, respectively, but the specific duty of 7 cents per pound was to be continued.

Furthermore, because it was felt that German patents had formed an obstacle to the development of the American dyestuff industry, the idea was conceived that the German patents seized during the war should be placed in the hands of an institution strong enough to protect them and made available to American industry as a whole. Accordingly, a corporation known as the Chemical Foundation, Inc., was organized. Its purpose, as stated in the report of the Alien Property Custodian (1919) was "to acquire by purchase those German patents and to hold them as a trustee for American industry, 'for the Americanization of such institutions as may be affected thereby, for the expulsion or elimination of alien interests hostile or detrimental to the said industries and for the advancement of chemical and allied science and industry in the United States.'"

The company was capitalized at $500,000. Under its charter, only nonexclusive licenses were to be granted on equal terms to all proper applicants and in the United States without cost. The Alien Property Custodian sold to the foundation approximately 4,500 patents for the sum of $25,000. The balance of the foundation's capital was designed as working capital to be used primarily to prosecute infringements by prospective German importers. Surplus was to be used for the retirement of preferred stock and for the advancement of chemical and allied science and industry. The president of the foundation was Francis P. Gowan who had directed the investigation of the chemical industry for the Alien Property Custodian.

II. REENTRY OF FOREIGN INTERESTS

1. *Participation by the Swiss.*—The early post-war period witnessed increased activity in the United States by Swiss manufacturers of dyestuffs. Although the Swiss have been dependent on other countries for coal and other mineral substances used in the production of dyestuffs, the development of the industry

Digitized by Google

in that country paralleled on a smaller scale that of Germany and prior to the war Switzerland ranked second to Germany as a dye producer with 90 percent of its production going into the export market. Scarcity of German colors and raw materials during the war aided Swiss industry. After the close of the war in 1918, the three leading Swiss firms, Society of Chemical Industry in Basle (Ciba), Chemical Works formerly Sandoz, and J. R. Geigy, S. A., entered into a community of interests agreement (Interessengemeinschaft), whereby they agreed to pool profits according to a certain prescribed ratio, to coordinate their research activities, and trade in foreign countries. It was provided that a central committee composed of representatives of the three companies would direct matters of policy. Exhibit 2 is a rough translation of a copy of this agreement. Shortly thereafter each of these companies organized in the United States for the American and Canadian markets a separate sales organization—Ciba Co., Inc., Goigy Co., Inc., and Sandoz Chemical Works, Inc. The stock of each company is owned by its parent in Basle, except that of Ciba which since 1939 has been held by a trust company holding part of the American interests of Ciba Basle.

In 1920 the three Basle companies organized the Cincinnati Chemical Works, Inc., whose stock they held in the ratio prescribed by the 1918 community of interests agreement (Ciba 52 percent, Geigy 24 percent, Sandoz 24 percent). The three Swiss companies in New York thereafter sold not only products imported from Switzerland but also those manufactured by Cincinnati in accordance with processes and know-how furnished from Basle.

2. *Reentry of German manufacturers.*—The intended results of the tariff and of the establishment of the Chemical Foundation, as directed against the Germans, were largely mitigated early in the post-war period. The foundation issued licenses to Kuttroff-Pickhardt & Co., which had received its business as agent for Badische, to import certain products for which the foundation then held the patents.

In 1919 the stock of the Bayer Co. and of Synthetic Patents Co., which owned Bayer's plant and patents numbering more than 1,200, was sold at auction by the Alien Property Custodian to Sterling Products Co. (Inc.), an American-owned corporation, which had agreed to dispose of the dye plant and patents to the Grasselli Chemical Co. The purchase price was $5,310,000, plus back taxes and other accumulated obligations which aggregated more than a million dollars.

The year 1923 marked the beginning of overt activity in the United States by German interests. In that year negotiations were begun between the German Bayer Co. and Grasselli Chemical Co., which had acquired the plants and property of Bayer from Sterling Products, Inc., and had in fact employed the personnel of the pre-war Bayer Co. for the establishment of a jointly owned company in the United States. In an agreement dated May 12, 1924, which I submit as exhibit 3, the purpose of the new company was stated in section 1 (b) to be "to build up, promote, and develop the dye industry in the United States and to manufacture such dyes, intermediates, etc., as can be manufactured in the United States to its advantage and profit, and to purchase and sell said products in such cases where same can be done to the greater advantage of the new company than its own manufacture thereof."

Grasselli Chemical agreed to convey to the new company all its dyestuff properties, inventories, and manufacturing rights in the United States and Canada; Bayer agreed to assign its present and future American patents and trademarks, to furnish such technical staff and technical assistance in training new employees as should be necessary, and to grant the sale and exclusive right to import and sell in the United States and Canada products manufactured by it. The new company, however, was to be restricted in its sales to "the United States, its territories, and Canada," and only with Bayer's subsequent approval could it engage in export activities. It could not engage in the manufacture and sale of heavy chemicals, "other than those and to the extent which it needs in the conduct of its business and which G (Grasselli) is not in a position to manufacture and supply." Grasselli Chemical was to receive 51 percent of the stock of this company, but the holdings of the parties were to be equalized when bonds in the value of $3,250,000 which Grasselli Chemical was to receive in change for property, plant, and equipment, should be liquidated. And both parties agreed not to invest in or support any other company in the United States which would compete with the proposed company.

Digitized by Google

A letter from Bayer to Grasselli Chemical dated May 14, 1924, which I introduce as exhibit 4, confirmed oral authorization to incorporate the new company under the name of the Grasselli Dyestuff Co. This company was to start business July 1, 1924.

On June 17, 1924, Bayer, Grasselli Chemical, and Grasselli Dyestuffs entered into a new agreement which contains substantially the same provisions as the agreement of May 12. Grasselli Dyestuff, which had been incorporated under the laws of Delaware since the previous agreement, was designated to engage "in the manufacture, purchase, and sale of dyestuffs, intermediates, and organic chemicals * * *." The contributions of Bayer and Grasselli Chemical were recited and the same restrictive provisions and financial arrangements contained in the earlier agreement were incorporated in this one, which I introduced as exhibit 5.

By the addition of Hoechst, another German manufacturer, to the agreement on March 3, 1925, an additional measure of German control was achieved. By that agreement 30 percent of the stock of Grasselli Dyestuff was to be allotted to this company, which provision would ultimately have had the effect of reducing the interests of Bayer and Grasselli Chemical to 35 percent, respectively. A supplemental agreement executed the same day provided for the organization of a new corporation to take over the sales of Grasselli Dyestuff. These agreements of March 3, 1925, constitute exhibit 6.

A short time later, on July 31, 1925, a group of eight German manufacturers then organizing I. G. Farbenindustrie entered the American scene. Another agreement was executed, and the parties thereto were Grasselli Chemical, Grasselli Dyestuff, Herman Metz, Bayer Hoechst, and the so-called German manufacturers. This agreement, although terminating and canceling that of March 3, 1925, was regarded by the parties as a modification of the earlier contract of June 17, 1924, and the provisions of the earlier agreement were therein amended to conform to this one. This contract may be regarded as the basic contract by which future conduct of the parties has since been regulated.

Hoechst and the manufacturers granted to Grasselli Dyestuff * * * "the sale and exclusive right to manufacture in the United States of America (its territories) and Canada, * * * dyestuffs, intermediates and organic auxiliary products but intermediates and auxiliary products only insofar as being products, that are chiefly employed in the manufacture of dyestuffs and colors. * * *"

However, Hoechst and the manufacturers agreed to furnish auxiliary and intermediate products for Grasselli Dyestuff's own use but not for resale. Grasselli Dyestuff also received the right to manufacture in the same territories (1) bichromates, (2) chrome oxides, (3) chrome salts, and (4) all other chrome tannery agents. Certain products listed were excepted from this general grant.

Hoechst and the manufacturers agreed also to give Grasselli Dyestuff the exclusive benefit of all their research, inventions, technical and practical experience, etc.; to furnish trained employees and otherwise instruct Grasselli Dyestuff's employees; to assign present and future Canadian and American patents and patent applications relating to these products; and further agreed that, "during the corporate existence of (Grasselli) Dyestuff, they will not manufacture in the United States of America, its territories and Canada, said products, or invest in or support, directly or indirectly, any company, organization, or individual engaged in the United States of America, its territories, and Canada, in the manufacture of said products (par. 5)."

Grasselli Dyestuff agreed (sec. 8) "to confine its manufacture and sale of said products to the United States of America, its territories and Canada." And this restriction might be waived by the parties only if Grasselli Dyestuff, Hoechst, and the manufacturers agreed that such waiver would "be of advantage to all of them."

Hoechst and Metz were to receive 30 percent of the stock of Grasselli Dyestuff, with an appropriate distribution by Hoechst to the manufacturers as their interests appear. The effect of this provision was to reduce American participation through Grasselli Chemical to 35 percent.

Provision was made for the establishment of a new selling organization in the United States. Furthermore, inventions by Grasselli Dyestuff were to be exploited by that company in the territories allotted to it; in Germany, by Bayer, Hoechst, and the manufacturers, "as they may determine." The latter group

Digitized by Google

was also to apply for patents in Germany, but Grasselli Dyestuff would obtain 50 percent of the profits on sales for German consumption and total profits on sales by Bayer, Hoechst, and the manufacturers elsewhere.

Also, on July 31, 1925, Grasselli Chemical and Bayer entered into a new profit-sharing agreement. Therein Bayer agreed to pay Grasselli Chemical 12½ percent (10 percent if Badische entered the agreement, which that company did do on December 1, 1925, exhibit 8) of profits gained by Bayer, Hoechst, and the manufacturers in exporting to the United States, its Territories, and Canada, any of the products within the scope of the principal agreement. Grasselli Chemical agreed to pay sums so received above $150,000 per year to Bayer for the benefit of Bayer, Hoechst, and the manufacturers, until a total of $750,000 has been paid.

These agreements of July 31, 1925, are introduced as exhibit 7.

The new selling company, General Dyestuff Corporation, was incorporated in 1925 and its stock was allotted one-third to representatives of Grasselli Chemical, one-third to Metz, previously identified as American agent for Hoechst, and one-third to Kuttroff-Pickhardt & Co., agent for Badische. General Dyestuff absorbed the sales organizations of the concerns represented by the shareholders; in this manner the sales representatives of the German companies forming I. G. Farben were consolidated into a single unit in this country. Shortly after the formation of this company, the stockholders granted options on their shares to I. G. Farben, which options continued until sometime in 1939. Although the beneficiary was changed from time to time after 1933, each beneficiary was controlled by I. G.

The organization of General Dyestuff and the creation of the options is described in a statement by E. K. Halbach who has been president of the company since 1930, which I introduce as exhibit 9.

By December 1925 the organization of I. G. Farbenindustrie in Germany had been completed (exhibit 10). On January 1, 1926, I. G. entered into a contract with General Dyestuff (exhibit 11) designating the latter its exclusive selling agent in the United States, including its Territories (General Dyestuff was also selling agent for products manufactured by Grasselli Dyestuff).

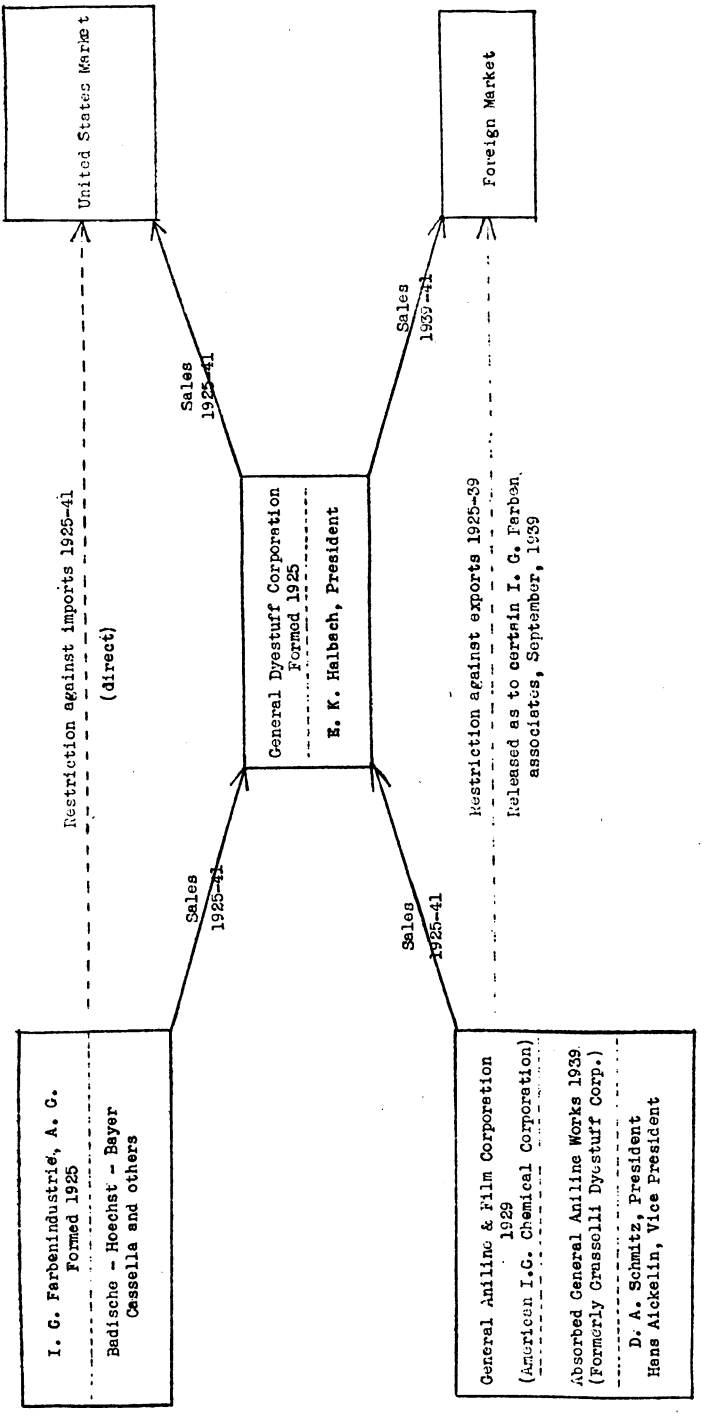
Thus, within the short space of less than 3 years, the now consolidated German interests were in control of 65 percent of the stock of Grasselli Dyestuff (manufacturing company), and active in the control and management of General Dyestuff (selling company) which was restricted from competing with I. G. outside of the United States. This pattern continued to be substantially the same until the outbreak of the present war. However, its framework was slightly altered from time to time, generally with the result of increasing German control.

On October 20, 1928, Grasselli Chemical was eliminated as a party to the agreements of July 31, 1925, but in a contract executed on this date between I. G. and Grasselli Dyestuff all rights and obligations of Grasselli Dyestuff under these preexisting contracts were ratified, confirmed, approved, and regranted (exhibit 12). On October 23, 1928, Grasselli Chemical sold its assets to E. I. du Pont de Nemours & Co.; H. A. Metz gave Grasselli Chemical three notes for $500,000 each in payment of Grasselli Dyestuff's obligations to Grasselli Chemical, and the latter relinquished to Metz all its remaining interests in the dyestuff field, including its General Dyestuff stock, Grasselli Dyestuff stock, its patent rights, etc. This transfer gave Metz control of two-thirds of the stock of General Dyestuff, and a substantial block of Grasselli Dyestuff stock, which ultimately was acquired by I. G. Farben, thus yielding to the German interests complete control of that company.

In the following year, 1929, Grasselli Dyestuff changed its name to General Aniline Works, Inc. In April 1929, Herman Schmitz, acting in behalf of I. G. Farben, of which he was financial director, organized American I. G. Chemical Corporation, to which shortly thereafter was transferred the stock of General Aniline Works. In 1939, the name of General Aniline Works, Inc., was changed to General Analine & Film Corporation, which was absorbed into American I. G., the merged corporations adopting the new corporate name, General Analine & Film Corporation, and General Aniline Works became the dyestuff manufacturing division of the new unit.

The following chart depicts the nature of the restrictions imposed and the relative positions of the parties to the agreements discussed:

Digitized by Google



Digitized by Google

The German and Swiss interests have for sometime constituted approximately 40 percent of the American dyestuff industry. From the time of their respective organizations until recently their sales policies and business conduct have been determined and controlled by their affiliated companies in Europe, namely, I. G. Farben and the Swiss. Until the outbreak of the present war in 1939 none of these companies was permitted to, or did in fact sell, dyestuffs in markets of the world except the United States and Canada. Thereafter, as I shall discuss more fully at a later point, they exported dyestuffs to certain markets in accordance with permissions received from their affiliated companies in Europe.

III. TREND TOWARD CONSOLIDATION AND CARTELIZATION

1. *Rise of dominating interests within particular countries.*—Largely because of the acute competitive situation which had developed as a result of the war, a trend toward consolidation of producing companies in particular countries began to take place; this, in turn, had its counterpart in a movement toward cooperation among the dominant concerns in these countries.

In Germany the movement toward consolidation which had begun to take place even before the war, finally culminated in 1925 in the amalgamation of the principal dyestuff and other chemical interests into I. G. Farben. In Switzerland, in 1918, the major dyestuff manufacturers, Ciba, Sandoz, and Geigy entered into the community-of-interests agreement previously described, which provided for an allocation of markets, pooling of profits, and exchange of technical information. In Great Britain, after the war, the British Dyestuffs Corporation had absorbed the principal dyestuff manufacturers; in 1926 this company merged with other dominant chemical firms into Imperial Chemical Industries, Ltd. In France, Etablissements Kuhlmann had assumed the leadership of the dyestuff industry and exercised control over other manufacturers.

This movement toward consolidation and merger within particular countries also characterized the United States market. In the period 1919–29 the number of domestic dyestuff establishments was reduced from 90 to 49, and a large part of the dyestuff business had come under the control of a few large manufacturers. In addition to General Aniline and the Swiss companies, three domestic producers rose to positions of dominance: Du Pont, National Analine & Chemical Co., which was a wholly owned subsidiary of Allied Chemical & Dye Corporation, and the Calco Chemical Co., which was acquired in 1929 by American Cyanamid Co., under which it became an operating division. Numerous other companies manufactured dyestuffs on a small scale but were not in a position to exert much influence on the market. Likewise, the number of intermediate manufacturers had diminished, and the majority of these products began to be produced by a few large companies. Allied Chemical and American Cyanamid, through National Aniline and Calco, respectively, became important producers; in addition, Monsanto Chemical Co., the Sherwin-Williams Co., and the Dow Chemical Co. occupied strategic positions in this field. General Aniline and Cincinnati Chemical, which supplied the Swiss companies, manufactured intermediates primarily for their own use.

The domestic picture will be further analyzed at a later point in the discussion, but the significance of this trend toward consolidation is now noted.

2. *Development of the cartel movement.*—In the period 1920–28 discussions and negotiations continually took place among the principal dyestuff manufacturers in Europe, and between these dominant European interests and companies in the United States, for the purpose of eliminating competition among themselves in world markets. The formation of I. G. Farben, of I. C. I., and of Kuhlmann, together with the emergence of certain dominating companies in the United States, facilitated the undertaking of far-reaching agreements.

3. *Du Pont–I. G. Farben.*—In the early post-war period there were certain preliminary efforts to bring about cooperation between du Pont and the predecessor companies of I. G. Farben and also with British Dyestuffs Corporation, which later became a part of I. C. I. On June 20, 1922, Jasper E. Crane, European manager of du Pont, wrote F. W. Pickard, vice president of du Pont, in Wilmington, summarizing discussions which he had had with officials in England. This letter, which I introduced as exhibit 13, states in part:

"The above, together with the numerous articles in the newspapers about the British Dyestuffs affairs, has made me convinced that it is a very propitious time to negotiate with the British Dyes. They may be far behind us in technical information, but undoubtedly have a good deal of valuable knowledge, while their negotiations with the Germans may result in developments

Digitized by Google

that will be important to us. If, therefore, you can spare the time, I think it most desirable for you to come over to London. Possibly if you can come, you will be here when Mr. Haskell is here, and I hope that you will not have to delay your visit much later than the early part of July."

In a letter written December 17, 1926 (exhibit 14), Wendell R. Swint, a du Pont executive in Wilmington, described to Crane the amalgamation of the dominant British chemical companies into I. C. I.

"When Sir Harry (referring to Sir Harry McGowan) was in New York he met Sir Alfred Mond there, and in the course of a couple of hours' conversation, these two had reached practical agreement to consolidate the British Chemical industries into a single company. The details of this agreement were arranged shortly after the return of Sir Harry to London, with the result which you now know. While in New York, Professor Bosch (of the I. G.) was informed of the proposed amalgamation, and expressed himself as extremely well pleased, and it was arranged that he would stop off in London on his return to Germany.

"Sir Harry explained * * * that the formation of I. C. I. is only the first step in a comprehensive scheme which he has in mind to rationalize chemical manufacture of the world. The details of such a scheme are not worked out, not even in Sir Harry's own mind, but the broad picture includes working arrangements between three groups—the I. G. in Germany, Imperial Chemical Industries in the British Empire, and du Ponts and the Allied Chemical & Dye in America. The next step in the scheme is an arrangement of some sort between the Germans and the British. He appreciates fully, or at least he says he does, the supreme difficulty in the way of the final step, namely the personality of the management of the Allied Chemical & Dye. In spite of this, he is hopeful that a satisfactory arrangement can be come to."

Durng the period 1927–29, du Pont negotiated continuously with I. G. Farben for the establishment in the United States of a jointly owned dyestuff company which would protect and advance interests of both parties in the United States. During the summer of 1927, Lammot du Pont, then president of du Pont, made a trip abroad with Irênê du Pont and Crane, and in a report to the executive committee, dated August 22, 1927, (exhibit 15), reported the nature and results of his discussions with officials of I. C. I. and I. G. Farben. Concerning negotiations with the Germans, the report states in part:

"On August 1st we met Dr. Bosch at his residence in Heidelberg. There were also present, Doctors Schmitz, Gaus, Abel, and Von Kniernien. Dr. Bosch readily agreed on the desirability of cooperation between the I. G. and du Pont Company, if a satisfactory plan could be found. He explained at considerable length Germany's need of exports and the desirability of the American market for this purpose. He fully recognized the effect and availability of the American tariff. I judge that, if any arrangement was to be made between us, a recognition of the importance of German exports to America would have to be part of it. We discussed the various branches of our business and gave our views on each, which views seemed rather favorably received, and we were asked to submit a definite plan on each branch. This was done and presented at a later meeting, at which the suggestions on each branch were discussed and explained. Dr. Bosch asked for copies of these suggestions in writing and time to go over same with his associates. Copies were accordingly furnished him, as per attached memorandum" (exhibit B).

These general principles of cooperation submitted were the following:

1. The purpose of the proposed cooperation is to promote existing business, encourage development of existing lines, and encourage invention or discovery of new products and processes.
2. Each agreement or joint effort must be such as to benefit both partners.
3. Desirability of imports to America of German-made goods is recognized, but will not be encouraged if, (*a*) business is already covered by American manufacture, (*b*) import to America seems to stifle or hamper an American key industry.
4. In every case American business must be controlled and managed by American partners.

Specific proposals relating to dyestuffs were the following:

1. Du Pont will separate its dye dept. from other branches.
2. Du Pont dye dept. and General Dye Corp. (All of the I. G. controlled dye business in America) will be consolidated on basis of appraised values.

Digitized by Google

3. An effort will be made to consolidate above with Grasselli Dyes and/or Sterling Products on appraisal basis into "American Dyes."

4. "American Dyes" will issue stock for cash for its development and expansion and I. G. will have preferential right to subscribe until du Pont will have not less than 60%.

5. "American Dyes" will receive free all future improvements, useful processes and technique from its stockholders, but will not be bound to cede new discoveries to du Pont or I. G.

6. If it is profitable and good business, and so far as is consistent with the maintenance of a self-contained organic chemical industry in U. S. A. and a school for technical advance, American Dyes will import from Germany and sell in America.

7. Development and expansion of American Dyes will be governed absolutely by its board and this will be controlled by du Pont Co.; I. G. will have representation proportional to stock holdings.

The principal issue arising from these negotiations was control of the new corporation which ultimately proved an insuperable obstacle. To du Pont's demand for 51 percent control, I. G. responded:

"(Par. 4.) I. G. suggests a 50/50 stock ownership so that they would have a veto power as to expansion, export, and prices, and thus be able to protect their world markets against American competition. We did not agree to this and stood firm that such an arrangement would be impossible. In connection with this proposition, the I. G. suggested the desirability of taking in the Allied Chemical & Dye Corporation. We gave it as our opinion that this was impossible on account of the Sherman Law. They also suggested that it might be desirable to take in the Cyanamid Company.

"Dyes: The I. G. had no criticism of our suggestions, but stated that they must take the matter up with their American associates first before giving any answer. We understood that they had in mind Grasselli, and offered to approach Grasselli, with whom we are on friendly terms, but were requested to allow them to take the matter up first. In this connection, Dr. Bosch suggested the desirability of taking in the Swiss Company in America.

In December 1927 Pickard made a trip abroad and held numerous conferences with officials of I. G. Farben. The I. G. further again emphasized its desire for equal participation in the new company. In response to Pickard's cabled request for further instructions. Harrington cabled (exhibit 16): "Think we should insist upon du Pont having absolute control of the combined companies, except guaranties protecting minority interests * * *" These guaranties referred to German participation in management, financial structure, and scope of the company's activities.

The negotiations continued during the next year. Early in 1929 Swint and Pickard held further discussions with Messrs. ter Meer, Greif, and Waibel of the I. G. In a letter from Pickard to Harrington, January 14, 1929 (exhibit 17), Pickard reported:

"Later on they (the I. G. representatives) suggested a possible compromise in the form of du Pont 51%–I. G. 49% with an option to I. G. (perhaps 10 years) on 1% of the stock, which if and when exercised would result in 50–50 ownership. They stated this was their own idea, not proposed to their board, but one they would recommend for favorable action.

"Their idea, they said, was with such an option we could not and would not act in important matters without consulting them, but that it was not their idea to exercise the option unless a very serious disagreement arose.

* * * * * * *

"Their pride as the leading dyestuff manufacturers and developers is undoubtedly hurt by our demand for control, and I judge there is no chance of changing their minds on that point. They feel however that the option mentioned would salve over that feeling.

* * * * * * *

"I think I can safely say that we must consider this arrangement seriously or give up all idea of a German alliance.

"You will appraise more accurately than I can do the strength of their argument that they can control the U. S. market eventually on the more expensive and profitable lines of dyes—bearing in mind the production of new and patented types, and their strong technical position in the production of pure intermediates.

* * * * * * *

Digitized by Google

"I am not making any recommendation but I think the proposition worthy of serious consideration."

To this letter Harrington replied by cable, January 29, 1929 (exhibit 18):

"Glad (to) note concession already offered but feel we must stand firm on control thereof. We are willing (to) offer any reasonable concession (to) protect minority interest which does not involve control. Anxious (to) deal if possible * * *"

On April 15, 1929, there was another meeting between representatives of du Pont and I. G. Farben in Wilmington, Del. Dr. Bosch, Dr. Schmitz, Dr. Gaus, Dr. Greif, and Mr. Paul Pickhardt, represented the I. G., and Messrs. Lammot du Pont, and Irénée du Pont, F. W. Pickard, and W. S. Carpenter (now president of du Pont) represented du Pont. It was recognized that the issue of control would prevent the two companies completing their plans for the establishment of a jointly owned subsidiary and with respect to this matter the report of this meeting (exhibit 19) summarized the situation in the following manner:

"Mr. Pickard told J. K. Jenney informally that the dye situation in this country had been gone over again, and that the attitude of neither party had changed—i. e. the Germans insisted they must have at least 50% of the proposed American Company, while du Ponts insisted that for national reasons they must have 51%. It was therefore recognized that nothing further could be accomplished along these lines at least for the present. It was agreed that the Sales Departments of the two companies should establish as frank and friendly relations as possible."

That this friendly cooperation has continued to exist is evidenced from a report of a meeting between representatives of the I. G. and of du Pont at the home of Lammot du Pont on October 22, 1935 (exhibit 20). A summary of this meeting prepared by one of the I. G. delegates states:

"We pointed out in particular * * * that an amicable cooperation existed in the field of dyestuffs, consisting on the one hand of understandings about foreign markets, and on the other of amicable settlements of all patent litigation in the U. S. A. We further called to their attention that there had been a uniform sales policy and that the General Aniline Works had made big purchases from du Pont of heavy chemicals and intermediate products. * * *"

A report entitled "Investigation of Patent and Processes Situation Respecting du Pont and the I. G." prepared March 18, 1936, also refers to these cooperative endeavors (exhibit 21).

"Present methods of handling I. G. Contracts:

* * * * * * *

"In the last few years du Pont-I. G. relationships have notably improved, due partly to the personalities of individuals entrused with negotiations and partly to an officially more friendly attitude from higher up in the I. G. organization. Also it is said that I. G. now wishes to put its patent office operations in this country on a profitable basis through a liberal policy in granting licenses.

"Various informal contacts and the cementing of more cordial relations have been achieved through the London Office but all actual patent licenses and agreements have been worked out with I. G. in New York.

"Orchem. (which refers to the Organic Chemical Division of du Pont), has been notably successful in dealing with Mr. Duisberg and the I. G. patent firm of Hutz and Joslin in New York City. In the last three years some 42 licenses have been negotiated and interferences settled and these things are now more or less taken in their stride with the important and unimportant items all being run through the mill together. Messrs. Holmes of Orchem. and Brownell of the legal department, have achieved excellent results in their handling of this situation."

* * * * * * *

Fields where general agreements or understandings exist—patents in general:

"The I. G. and du Pont (the general heading of this section is "Patents in General")—The I. G. and du Pont have an informal agreement that when we have German patents which seem to us might be profitable exploited in Germany, and when these patents cover subjects on which we have no prior commitments or moral obligations to discuss with anybody else, we will bring them first to the attention of the I. G. and they will do the same for the United States. There is a letter from Dr. Ewing to Dr. ter Meer, (whom we have previously identified as associated with the I. G.) dated July 5, 1935, to this effect."

Digitized by Google

This policy of cooperation is further indicated in a letter dated July 7, 1937 (exhibit 22), from J. E. Kupperian, control division of du Pont, to Henry E. Ford, manager, London office:

"As you perhaps know, it is our policy, as far as possible to settle patent conflicts with G. A. W. by agreement. It so happened that at the time the question of this patent came up, we had also a number of other patents up for consideration, that is patents that we own under which G. A. W. desired a license, as well as patents owned by G. A. W. under which we desired a license. As as part of the whole settlement, we have drafted an agreement giving G. A. W. a royalty-free, nonexclusive license under the I. C. I.'s patent and are attaching two signature copies for execution by I. C. I. if they are agreeable to grant the license suggested."

In a letter dated December 2, 1937 (exhibit 23), from F. B. Holmes, assistant chemical director of du Pont to C. A. Grasselli in du Pont's London office, a prospective agreement between du Pont and General Aniline Works is discussed in the following terms:

"We have had considerable discussion on the question of possible exchange of information between ourselves and G. A. W. and also on the question as to whether free licenses should be given by one party to the other only under patents covering inventions made prior to the present time or whether these licenses should also extend to patents on inventions made by one party or the other during the life of the agreement.

"It occurs to us that both I. C. I. and the I. G. would perhaps be quite willing that we and G. A. W. should see the I. C. I./I. G. agreement. We would appreciate it if you would talk with I. C. I. in order to ascertain whether they would have any reason to object to our seeing the agreement. If there is any reason who we should not see it, we, of course, would be quite satisfied, but there might be some advantage in knowing the extent and terms of that agreement and perhaps in drawing our own agreement with G. A. W. along similar lines so far as it seems practical, especially in view of the current exchange of information between ourselves and I. C. I."

It is a fair inference from this summary of the trend of commercial relations between du Pont and the I. G. that despite their failure to consummate successfully their negotiations respecting the establishment of a separate company to further their interests in this country, both organizations cooperated extensively with each other. Naturally cooperation by I. G. in this country was carried out by General Aniline, I. G.'s representative in the United States, as will become increasingly apparent in subsequent portions of this statement. Collaboration in the United States was merely an aspect of cooperation between I. G. and I. C. I. in other parts of the world. It was with I. C. I. that du Pont made its most effective and binding agreements and it is to the relationship existing between these two companies that I now turn my attention.

4. *du Pont–I. C. I.*—During the early post-war period, du Pont negotiated and conferred with I. C. I. with the ultimate objective of a far-reaching understanding respecting exchange of technical information and territorial allocations. Both I. C. I. and du Pont indicated the desirability of including I. G. Farben in any agreement that might be reached.

In the course of Lammot du Pont's European trip in 1927 to which I have previously referred, serious negotiations were entered into with representatives of I. C. I. as well as those of I. G. In his report on this trip (previously introduced as exhibit 15), Lammot du Pont made the following reference to the beginning of these negotiations:

"* * * I took up with Sir Alfred Mond and Sir Harry McGowan (chief officials of I. C. I.) the question of whether the extension of the patent and process agreement between Nobel and du Pont to the other branches of I. C. I. was satisfactory. Both these gentlemen seemed very favorably inclined toward such extension and stated definitely that it was satisfactory to the I. C. I., provided it did not prove to be detrimental to their current negotiations with the I. G., and provided the territorial arrangement was satisfactory. On this point I gathered that they want the British Empire as their territory against United States of America as our territory, and the rest of the world free except where commitments had already been made. This conversation was an expression of opinion on both sides without commitment."

On February 18, 1928, a meeting was held in Lammot du Pont's office at which was discussed the agenda for a meeting with I. C. I. representatives. The minutes of this meeting (exhibit 24) contains the following passage:

Digitized by Google

"Dyestuffs Department

"Extension of Patents and Processes Agreement.—Any arrangement on dyes must recognize the I. G. The ideal situation with respect to that company, would be to be let alone:

"1. Germans to refrain from substantial American investments.

"2. Germans to refrain from attempt to break down U. S. Tariff.

"3. Cooperation in export markets.

"4. A Patents and Processes Agreement would be advantageous to us.

"Alternate but less desirable arrangement: Formation of American partnership, to be controlled absolutely by du Pont.

"Stumbling blocks to I. C. I. agreement:

"1. Path to future arrangements with I. G. must not be barred. I. C. I. probably just as interested in this point as we."

These considerations were urged at a meeting of the representatives of I. C. I. and du Pont in Wilmington on March 6, 1928. Subsequent conferences and negotiations took place. The problem of fitting the I. G. into the general picture was quite serious. Finally it was solved at a meeting between Sparree and Sir Harry McGowan in London which was reported in a letter to Lammot du Pont dated May 30, 1929, as follows:

"I saw Sir Harry (McGowan) privately in regard to the I. G. dyestuffs situation and explained to him that the situation in the United States relative to I. G. is so important that we had to be very careful not to commit us to any arrangement of any kind which might prevent us at some later time from clearing up the I. G. dyestuffs situation in America. I mentioned the several alternate ways of handling the subject, and he took a very reasonable attitude, eventually accepting as the best solution the I. G. reservation given in your cable and which is the same as contained in the first page of Mr. Carpenter's letter of May 17th."

* * * * * * *

"However, after he had turned the suggestion over in his mind for awhile, the idea seemed to find favor with him and in particular will be much more satisfactory than to leave dyestuffs entirely out of the agreement. On account of the I. C. I. several commitments now in the dyestuffs field, they are, of course, not in a very good position to argue that du Pont shall be bound to them on dyestuffs, and I feel that this I. G. reservation will be accepted by I. C. I."

Finally, on July 1, 1929, these extensive negotiations resulted in the conclusion of an agreement acceptable to both parties (exhibit 25). The duration of the agreement was set at 10 years. The agreement provided in article I for an exchange of information:

"In respect of all patented or secret inventions now or hereafter during the life of this agreement owned or controlled by it, relating to the products herein specified, sufficient to enable the other party to determine whether it desires to negotiate for licenses covering any or all of such inventions."

In article II I. C. I. agreed to grant to du Pont sole and exclusive licenses relating to the products specified, which included dyestuffs, "within the countries of North America and Central America, exclusive of Canada, Newfoundland, and British possessions, but otherwise inclusive of the West Indies." Du Pont agreed to grant to I. C. I. similar exclusive rights "within the countries of the British Empire, inclusive of Egypt but exclusive of Canada and Newfoundland." It was further agreed that each of the parties would grant to the other nonexclusive licenses within any and all other countries not within the exclusive territories specified.

Article III enumerates the products to which the agreement applied. Section (h) of this article relates to dyestuffs and contains special provisions concerning business in India and relations with the I. G.

> (1) while it is recognized that India, as coming within the British Empire, is the exclusive license territory of I. C. I., nevertheless, as an exception, it is agreed that, owing to the exceptional conditions obtaining in and the circumstances appertaining to that market, the dyestuffs activities of du Pont in India may continue until such time as may be mutually agreed upon by the Presidents of the two companies, and that in determining the amount of compensation to be paid by I. C. I. under such licenses, due consideration shall be given to the extent of du Pont's activities which are thereby terminated in such territory;

Digitized by Google

(2) the provisions of this agreement shall not apply to tetra-ethyl lead, but licenses with respect to said product may be the subject of separate negotiation;

(3) while inventions relating to dyestuffs and their intermediates are included in this agreement and subject to the provisions hereof, it is mutually agreed that, due to the exceptional conditions of said industry and the tentative negotiations during recent years with I. G. Farbenindustrie A. G., either party shall be free at any time to enter into separate agreement or arrangement with the latter company covering said industry. Upon the execution of such agreement or the entering into of such arrangement, this agreement insofar as it relates to the dyestuffs industry shall cease and terminate; provided, that all licenses theretofore granted under the terms of this agreement shall continue during the period for which granted, but all exclusive licenses so granted by each shall automatically become nonexclusive. Each of the parties agrees, however, that in negotiating or upon entering into such an agreement or arrangement with said I. G. Farbenindustrie A. G., it shall use its best efforts to extend same to include the other party hereto.

Other articles of the agreement relate to the obtaining, granting, and protection of licenses and sublicenses, arbitration, etc.

On September 15, 1931, du Pont and I. C. I. entered into an agreement by which du Pont transferred "all of du Pont's assets located in the Empire of India relating solely to dyestuffs and related products * * *" in exchange for all of the issued and outstanding capital stock of Dyestuffs Corporation of America which was wholly owned by I. C. I. and was engaged in the purchase and sale of dyestuffs in the United States. This agreement is submitted as exhibit 26.

When I. C. I. entered into an agreement with I. G. in 1931 by which it became a member of the European dye cartel, it informed du Pont that the agreement with I. G. would not affect its (I. C. I.'s) relations with its American partner. This is so stated in a cable from du Pont's representative in London to Wilmington, December 3, 1931 (exhibit 27).

Although du Pont and I. C. I. commonly referred to their 1929 agreement as a patents and processes agreement, it was plainly their intention to include products of all types within its scope. Each party scrupulously respected the exclusive territorial jurisdiction. At times certain areas belonging to one of the parties would be leased for a period to the other. For example, a letter from I. C. I. to du Pont, January 12, 1938 (exhibit 28), indicates that the companies had leased certain territories to each other for that year.

Even before the agreement of July 1, 1929, had been executed, du Pont and I. C. I. had agreed upon using a jointly owned company for the advancement of their mutual interests in Canada. This company was Canadian Industries Ltd. (C. I. L.). Until 1936 the relations of du Pont, I. C. I., and C. I. L. were not governed by any formal agreement but by minutes of meetings of their representatives and exchanges of correspondence. Minutes of a meeting dated October 12, 1928, referred to the policy of I. C. I. and du Pont relative to the Canadian market in the following language:

"(1) *C. I. L.—Policy of principals relative to new products.*—It was agreed in principle that I. C. I. and du Pont desire to cooperate to the maximum degree insofar as practicable in any venture involving the manufacture and/or sale of a product in which either or both principals are interested insofar as such venture wholly involves Canada and insofar as the products manufactured and/or sold are destined for Canadian consumption, and recognize Canadian Industries Ltd. as the proper vehicle for such cooperation. On the other hand, they also recognize that there may be individual cases where the interests of the principals may be better served by other procedure. To provide for such contingencies it was agreed that neither principal is obligated to turn over its business in any individual product against its best interests nor will either principal turn over any venture to C. I. L. contrary to the wishes of the other.

"Both principals agree to inform C. I. L. in advance of any plans made by either relative to the manufacture and/or sale of a product in Canada so that C. I. L. may have an opportunity to convince the principal in question that it is practicable for C. I. L. to undertake the venture.

"This Minute supercedes the Minute on this subject of April 7th, 1919 excepting that the principle that the transfer of each such business is to be effected on

Digitized by Google

terms to be arranged and is to have regard to the good will existing therein continues to be recognized."

This minute is introduced as exhibit 29.

At subsequent meetings on September 9, 1930, and December 4, 1930, the policy to be pursued by the three companies was further clarified (exhibits 30, 31). It was subsequently determined that it would be advisable from the standpoint of du Pont to incorporate these various informal arrangements in a formal document. In a letter dated April 14, 1936, from C. E. Young, of du Pont, to G. W. White, of I. C. I., the reasons were stated in the following manner (exhibit 32):

"The reason for the setting up of the present triparty agreement is the claim by the du Pont Company that it is necessary for them, for legal purposes, to depart from the old method of operation by interpretation of minutes and old agreements and to set up a new document which will cover all previous minutes, letters, and agreements, and delimit the rights of the three parties concerned."

The existing arrangements between du Pont, I. C. I., and C. I. L. were incorporated in a formal agreement dated December 1, 1936 (exhibit 33), which provided for the transfer of the Canadian rights of I. C. I. and du Pont to C. I. L. This consisted of the grant of exclusive rights to practice any and all inventions owned or controlled by I. C. I. and du Pont relating to the products covered by the agreement within the Dominion of Canada and Newfoundland. In exchange therefor C. I. L. granted to du Pont and I. C. I. rights to take advantage of inventions developed by C. I. L. in the rest of the world. The license territories of I. C. I. and du Pont were to conform to those established in the 1929 agreement between these companies.

This agreement was continued until its expiration at the end of 1940 without substantial change. A letter dated December 16, 1940 (exhibit 34), signed by W. S. Carpenter, president of du Pont, and by officials of I. C. I. and C. I. L., states that the agreement will be continued on a year to year basis.

On June 30, 1939, du Pont and I. C. I. executed another over-all agreement to replace that of 1929 which was about to expire (exhibit 35). On July 31, 1939, Lammot du Pont issued a letter (exhibit 36) to general managers of all departments concerning the nature of the agreement which he stated "is substantially similar to the previous agreement (as amended by various supplemental agreements)."

5. *Organization of the European dye cartel.*—I have already made reference to the negotiations carried on by the principal dyestuff manufacturers in Europe and to the trends toward consolidation within particular countries, followed by intercountry agreements.

In 1924 a German-Swiss price agreement was reached affecting a small group of dyes. A short time thereafter the Swiss concluded an agreement with the French, the purpose of which was to stabilize the French market which the Swiss had been flooding with cheap dyes. In 1927 an agreement was effected between I. G. Farben and Kuhlmann, the dominating French company, for protection of the home markets of each party, establishment of production quotas, and division of foreign markets. Both I. G. and Kuhlmann continued negotiations for a broader and more inclusive understanding with the Swiss and British interests. (Exhibit 37; excerpt from Deutsche Volkswivt reported in Department of Commerce Circular, April 3, 1928.)

Finally, in 1929, an accord was reached by I. G. Farben, Kuhlmann and the Swiss, who thereafter have been commonly referred to as "the European dye cartel." Representatives of the Department of Justice have been unable to obtain a copy of this cartel agreement, but the Department of Commerce has published reports received from American attachés, trade commissions, and foreign publications into a comprehensive description of the nature and effect of these agreements, in its publication Commerce Reports. Exhibit 38 is a copy of this article, published July 22, 1929, the title of which is "The Dye Cartel and Dye Exports of Five Major Producing Countries." The importance of the agreement is emphasized in the first paragraph of this statement:

"The formal signing of the sales agreement by representatives of dye manufacturers of Germany, Switzerland, and France was one of the outstanding events of recent international activities. This agreement was signed by the three European countries, whose export trade in coal-tar dyes of 1927 accounted for more than three-quarters of the quantity of the world's exports and four-fifths of the value. The significance lies, however, in the fact that the signatures gave permanency to an oral agreement which had been in effect for the past three or

Digitized by Google

four years by enlarging and reducing to writing. In other words, it was the conclusion of negotiations lasting the past five years."

The preliminary negotiations included British interests; however the British were not parties to the final agreement. This was probably because of a lack of adequate centralization in the British industry despite the step in that direction through the organization of I. C. I. and also the insistence of the British that they be permitted to retain a privileged position in sales to the British Empire.

Sometime in 1931, however, as a result of further negotiations I. C. I. became a member of the European cartel and thereafter participated in various arrangements of this cartel respecting quotas and prices. As a result of the inclusion of I. C. I., I. G. Farben agreed to discontinue the sale of dyestuffs in the United Kingdom, I. C. I. informed du Pont that this arrangement would in no way effect its agreement with du Pont (exhibit 27, previously introduced). The annual report of the Society of Chemical Industry in Basle (Ciba Basle) for 1931 (exhibit 40) made the following reference to the cartel arrangements and the inclusion therein of the British:

"The policy followed by our management from the standpoint of creating international cartels for the distribution of sales has proved itself very good, particularly in these critical times, in that the stabilization and the consolidation in the dystuffs business, brought about by the arrangements previously concluded, could be carried through while avoiding useless competition at the time of adaption to the present requirements of the market. We should also mention here that a similar agreement has been concluded between the Continental Dyestuffs Cartel and the most important English dyestuffs producer, Imperial Chemical Industries Limited."

It is further stated in the article from Commere Reports that:

"According to the communiques which have been issued, this agreement does not deal with business carried on in the United States. The elimination of the United States from the market subdivision, according to the continental press, was intentional because of the American trust legislation, because the United States now produces a sufficient quantity of most dyestuffs—particularly synthetic indigo—to permit an export surplus, and because the three members wish to maintain liberty of action there."

The intended effect of the agreement on the American market is also indicated by the reference thereto contained in a list of I. G. agreements extending to the United States, submitted by the I. G. to Dr. Hutz of General Aniline Works in 1936 (exhibit 39):

Parties	Subject matter	Terms relating to United States of America	Duration of agreement
German I. G. Swiss I. G. Centrale des Motiéres Colorantes (C. M. C.)	Dyestuffs Cartel. Three-party agreement. Cartel agreement relates to dyestuffs and auxiliary products in the dyestuff industry.	As regards territory, the agreement covers the entire world with the exception of the U. S. A., however, sales to and exports from the U. S. A. fall under the agreement	Until Dec. 31, 1968.

In view of the control already possessed by the Germans and Swiss over a substantial portion of the American market, the import of the cartel on the United States becomes readily apparent—and significant. General Aniline (and General Dyestuff), by agreement with the I. G., and Ciba, Sandoz, and Geigy (including Cincinnati, their supplier), by agreements with Swiss owners, were already restricted from sales in world markets outside the United States and Canada.

The French have never engaged in the manufacture of dyestuffs in the United States. A letter dated February 25, 1935, from C. A. Rhein of Kuhlmann, to B. A. Ludwig, president of National Aniline & Chemical Co. (at that time a wholly-owned subsidiary of Allied Chemical & Dye Corporation) suggests that this French obstinance was the result of agreements with American producers, by which the latter consented to stay out of France. In this letter (exhibit 41) Rhein suggests that Kuhlmann turns over to National in other countries an amount of business equivalent to that done by National in France. Further:

"This suggestion emanates from the fact that your conferees in the U. S. A., because of our excellent relations with them, refrain from sale in France. On

Digitized by Google

our side, we have until now, renounced any desire to install a plant in the U. S. A. for the manufacture of dyestuffs."

In 1936 Kuhlmann began to import colors into this country through Fulton Dye & Import Co. Apparently the French had been allotted a quota of $300,000. A letter from H. Koechlin, a director of Geigy Basle, to Walter Saenger, vice president of Geigy in New York, dated May 26, 1937 (exhibit 42), suggests the necessity of admonishing Kuhlmann not to exceed this limit.

* * * * * * *

"I should like to use this opportunity to say a word about the separate report concerning the activity of the French group in the United States. There is reason to believe that the Frenchman will not be satisfied with his $300,000. It will be well to follow him from the very beginning and try to exert pressure on him through those channels which are likely to have an influence on him, to wit, our friends on the other side of the Rhine but, above all, du Pont who will be able to exert the strongest pressure on the French if he cares to do so. It will be necessary to speak plainly and perhaps even brusquely, otherwise the people in Paris won't react. This is for your personal information."

In 1940 the French organized in New York Saint-Devis Kuhlmann Saint-Clair Dyestuff Corporation (SKS Dyestuff Corporation), and in an agreement (exhibit 43) executed January 1, 1940, granted SKS the sole right of importation and sale in the United States of "dyestuffs, auxiliary products and organic chemicals for use in connection with dyeing and coloring. * * *" Paragraph 8 (as did par. 8 of the I. G.-Grasselli Dyestuff agreement of July 31, 1925) contained a restriction against sale "elsewhere than within the United States." The French companies were the stockholders of the new company, which imported until the fall of France.

During this period Allied Chemical & Dye Corporation, through its wholly-owned subsidiary, National Aniline & Chemical Co., was expanding its export trade and had commenced to establish itself as the principal American dyestuff company in markets outside the United States. It should be noted in this connection that for the large part of this period a substantial part of the stock of this company was owned by I. C. I.

IV. AGREEMENTS RESPECTING PARTICULAR MARKETS

Beginning sometime in the year 1930, Allied, du Pont, European cartel, and certain Japanese interests entered into agreements allocating quotas, fixing prices, and otherwise controlling the sale and distribution of dyestuffs in Japan, China, India, and other markets. Memoranda of the agreements relating to the Far Eastern markets referred to dyestuffs known as indigo and sulphur black, which constitute the bulk of consumption in these countries.

(Exhibit 44 is a chart prepared several years ago by the Department of Commerce indicating manufacturers in producing countries and cartel participation.)

1. *China.*—In 1931 National began to participate on a formal basis with the cartel in the Chinese market. On February 25, 1931, B. A. Ludwig, president of National, wrote to F. J. Emmerich, vice president of Allied, recommending approval of a contemplated quota agreement. This letter (exhibit 45) states in part:

"It has been determined by comparison of public and confidential figures, that the consumption range of China lies between 60,000,000 and 77,000,000 pounds Indigo 20% paste basis per year, tending strongly to the higher figure as concentrated products come into greater demand.

"Our participation by recommended agreement would be 18% of this market, or, between 10,800,000 and 13,860,000 pounds Indigo 20% paste basis per year.

"The agreement recommended by Mr. Bull (National's representative in China), and concurred in by us, is briefly as follows:

"1. A three (3) year agreement with all competition for our participation of 18% of the market on the following basis.

"2. Monthly review of inventory, sales, and imports by all concerned to control disbursements.

"3. Raise present price of 69 Taels as quickly as circumstances permit to 77½ Taels, all ex-warehouse Shanghai.

* * * * * * *

"As an important corollary to this agreement we will demand and expect prompt adjustment in all prices of miscellaneous colors, including Sulfur Blacks.

Digitized by Google

"We strongly recommend, and desire to cable today, the acceptance of the proposed agreement, particularly as it is our belief that it represents a key agreement not only in China but as favorably affecting our price and poundage participation throughout the foreign territories served by us in competition with I. G."

On February 27, Emmerich indicated approval (exhibit 46):

"Mr. Charles F. Weber and I have discussed the matter with Mr. Ludwig and concur in recommendation now presented, which provides for 18% partitcipation and understatnding that arrangement may be cancelled at end of any year upon 90 days' notice, in line with discussion Mr. Ludwig recently had with Mr. Waibel, I. G.'s representative, who visited Mr. Ludwig en route to China."

On May 22, 1931, J. Fistere, Jr., National's agent in China, wrote to E. R. Ellis, foreign sales manager of National, as follows, enclosing sample of competitive products:

"Under separate cover we are sending you by parcel post 2 oz. samples of each of the following colors (list of samples of products of I. G. du Pont, I. C. I.): These are the official samples submitted to us by the competition for the purpose of determining comparative strengths in connection with a quota agreement. The findings of the Shanghai laboratory are given in a report attached to Mr. Bull's confidential letter No. 22."

In 1932, the Dow Chemical Co., of Midland, Mich., sought to obtain a measure of participation in the Chinese market. Cables received from I. G. Farben and Ciba Basle by Ciba New York in April 1932 (exhibit 48) indicate that the I. G. and Ciba Basle were willing to grant Dow a small quota which would be marketed in China through the cartel, National, and du Pont. Dow's Canadian quota was to be deducted from its China sales. On June 3, 1932, Ludwig wrote Alfred Lichtenstein (exhibit 49), president of Ciba New York, which is agent for Dow dyestuff sales in the United States, confirming its agreement to purchase from Dow for 3 years 18 percent of Dow's allotment in China (18 percent was National's quota in China), this agreement being subject to "the continuation of committee control of the sale of indigo in China." The other participants in the China market apparently bought proportionate shares of Dow's quota.

On May 11, 1933, Guy W. Talbert, general manager of National, outlined in a letter to Ludwig (exhibit 50) a policy respecting China the adoption of which he recommended:

Policy—beyond December 31, 1933

National's participation in China premised on:

Period: January 1, 1934, to December 31, 1936—1 year notice of termination.

Position:

Indigo: Not less than 18% total sales.
Sulfur Blacks: Not less than 17% total sales.
Miscellaneous Colors Only:

Direct Blacks	15.5%
Direct Blues	14.5%
Sky Blues	8.0%

Correction of quota disparity or price to take place within 90 days unless notice of termination is in force.

Prices: To equal former established basic Tael prices converted into China Dollars at the Chinese Government official conversion rate of 1 China Dollar is equal to 71½ Tael Cents.

Special items: * * * (colors listed): Subject to price arrangement only without quota or exchange of figures. Every other color to be "free" as to price and participation, although consideration may be given to prices exclusive of quota.

In general:

1. National will not tolerate deviation from its recognized participation.
2. National will not agree to entry of other domestic suppliers, and stands ready to resist any effort in this direction.
3. Deviation from foregoing will immediately result in application of:

Section (2). Sales to increase poundage beyond current totals to be maintained at market price until that price declines to a predetermined level, approved by New York, individually by color and branch; and

Digitized by Google

Section (3). When price declines to the approved and predetermined price level, we cease aggressive poundage drive and maintain our position through a series of lower prices, each one individually approved before quoting to the trade—

* * * * * * *

It is recommended that the negotiator be supplied with a copy of this policy and submit it when and if required, holding to its provisions whether submitted or not, except when fully developed reasons at New York prompt deviation by New York.

If it is at all possible, our confreres should be supplied with the essential sections of this policy in advance of the proposed meeting, so that practically all points may be ones of agreement when actual contact is made. To that end, a personal letter from you to the known party abroad would undoubtedly head off any claims that might be presented by the representative of our local competitor. Our claims under the policy above are well in line and not at all unreasonable view of our importance and sustained adherence to the accepted method of operation in the territory.

In March 1934, A. C. Lumley, National's representative for the Far East, writing to Ellis (exhibit 51) expressed certain qualms concerning Mitsui's aspirations in the export market. (The Mitsui interests, aided by Government subsidy, had become the dominant Japanese manufacturers of dyestuffs.)

"We must also take into consideration the present general policy of the Japanese government to urge and assist the building up of the export trade of Japan: In order to avoid revolution the government must hasten industrialization; export markets are absolutely necessary to industrialization and the course of the government in urging and assisting exports is, from their point of view, one of urgent necessity.

"We therefore see that every element in the present situation points to an early invasion of the China indigo market by Mitsui.

"They are anxious to build up Japanese foreign trade, they have a surplus of capital to invest, the government favors increase of exports, and Mitsui are actually manufacturing indigo and are able to sell it at a price much lower than the present China market price.

* * * * * * *

"In view of the above elements in the indigo situation, we believe we are justified in drawing the conclusions that a Mitsui invasion of the China indigo market may reasonably be expected soon. Soon may mean, I repeat, within a month and it may mean within a year, and there is no way of telling which, at the present time. But it seems highly probable to the representatives in Japan of all the Cartel firms that Japanese indigo export is coming in the reasonably near future.

"We therefore believe it will be wise to attempt to ascertain the limit of the Mitsui ambitions by meeting them in conference with the avowed object of attempting an amicable arrangement. Mitsui may refuse to enter such a conference; if so, nothing is lost and the fight can begin exactly as it would have begun without any conference proposal. Even if we get Mitsui into a conference, their ideas may be too big and they may demand a share of the world market larger than other indigo manufacturers are willing to give them. If so, again, the fight can begin as if the conference had not been held. On the other hand, there is just the chance that a satisfactory arrangement can be reached and a price war averted, and it is my firm conviction that such a possibility should be investigated."

The necessity of reaching an agreement with Mitsui was apparently realized later in 1934, for on July 18, Ludwig wrote Talbert (exhibit 52), in part:

Since Mitsui is the only Indigo manufacturer, his entrance into the Committee (i. e., Cartel, National, du Pont, I. C. I.) should make the control of prices a much easier proposition than the attempted control of sulphur black prices made by a number of Japanese plants.

"If it is intended to have Mitsui in the Committee on Indigo, it is certainly to Mitsui's and everybody else's advantage to leave the prices undisturbed. Hence our cable to Germany stating this fact. If Mitsui enters the Committee it would be idiotic to reduce prices now, and as their entrance seems assured we may after all, save the situation. All these points will be clear upon receipt of the reply from Germany.

Renewal of the China six party agreement for 1937 is indicated in a letter from Lumley to Ellis, May 10, 1935 (exhibit 53):

"A telephone message from Mr. Waibel (I. G. representative) at Tokyo received this morning informs us that the difficulties which were raised by DuPont with regard to the extension of the China six-party agreement to cover the year 1937 have now been overcome.

"This is taken to mean that DuPont are willing to renew the China six-party agreement for 1937 accepting the quota with no increase over 1936."

On November 3, 1938, Ellis submitted to Talbert a report on the China market (exhibit 54). In the area occupied by the Japanese at that time, Japan's average sales for the previous 3 years constituted on an average:

	Sales in occupied area	Percent of total Japanese production
	Percent	
Indigo	11.8	43.4
Sulphur Black	47.0	39.3
All others	19.1	17.7
All items	24.0	33.8

During 1936, National supplied 9.68 percent of the Chinese market; in 1937 this figure dropped to 7.25 percent. Percentages for other participating groups is not included in this report. However, Ellis does indicate a rather pessimistic outlook for the future, at least so far as National is concerned, although the prospect may not be so bad for the I. G. in view of the friendly attitude of Japan toward Germany. He writes:

"The above figures are emphasized because Japan not totally independent of imports of Miscellaneous Colors into Japan proper, and Japan's existing manufacturing capacity in Japan proper is still very inadequate to support Japanese ambition within the occupied Chinese area, regardless of what is undoubtedly a fundamental policy now with the Japanese Government; namely, to consolidate her commercial position in the occupied Chinese area to the exclusion, if at all possible, of foreign manufacturers, with the possible exception of what may be a co-operative plan with the German I. G."

2. *Japan.*—The same type of price and quota arrangements were developed in Japan at about the same time, and by the same parties. Here, however, the rise of Mitsui was felt somewhat earlier with the result that foreign interests were forced to agree to limit greatly their participation. Although reluctant to relinquish this profitable market, there was really no alternatice; besides, it was hoped that by doing so Mitsui itself could be restricted from other markets in the Far East. The result in China has already been observed.

A letter dated March 18, 1931, from A. C. Lumley, representative of National in the Far East, to E. R. Ellis, foreign sales manager (exhibit 55), discussed preliminary negotiations for apportionment of the Japanese market with Herman Waibel, who was a representative of I. G. Farben in the Far East. The letter describes the preliminary negotiations between Lumley and Waibel in which it was decided that the indigo agreement for Japan should "be on a similar basis to that for China," and that the basis for quota allotment should be sales for the years 19273–1929.

To this letter was attached a copy of a memorandum agreement between Waibel, acting on behalf of the Continental Cartel, and Lumley. It was provided that:

"The two parties have agreed to cooperate in the Indigo market of Japan and to divide the total Indigo sales in Japan of the above mentioned Indigo factories on the following basis:

Continental Cartel, 82½% of the total quantities of Indigo delivered and accounted for

National Aniline & Chemical Co., 17½% of the total quantities of Indigo delivered and accounted for

"The quantities will be fixed and reported on the basis of Indigo powder or Indigo in grains full strength. The agents of both parties in Japan will take the greatest care that the agreed quotas will be closely observed and that any

Digitized by Google

quantities exceeding the quota or shortage will be regulated soonest possible by holding back or pushing sales by the respective party, the necessary measures to be decided unanimously by the agents.

* * * * * * *

"The agents of both parties decide jointly in accordance with their factories on the sale and price policy for Indigo in Japan and are jointly responsible for the loyal execution of the foregoing agreement, especially with regard to strictly observing the quotas agreed upon.

"It is approved by both parties that the Indigo sales price for the brands of their factories will be immediately increased by Yen 10.—per cask of 1 cwt. net basis Indigo powder resp. grains.

"The above agreement starts on January 1st, 1931, and will last three years terminating December 31st, 1933."

On the first page of this letter of March 18, Guy W. Talbert, general manager of National, appended the following note:

"Mr. LUDWIG: I would have preferred not to have had a written agreement on file, and if you feel as I do on this matter, the attached copy together with all others should be destroyed.

"G. W. T. 4.9.31."

The memorandum agreement just referred to was apparently ratified by representatives of all companies concerned at meetings held March 24 and 25, 1931, the minutes of which meetings (exhibit 56) reaffirm the principles previously agreed upon by Waibel and Lumley.

Entry of Mitsui into the Japanese market was mentioned in a letter from Lumley to Ellis dated March 26, 1931 (exhibit 57).

The Japanese indigo agreement was renewed in 1933 for 3 more years. A cable dated July 31, 1933 (exhibit 58), to F. B. Hillhouse, at Kobe, Japan, stated: "Indigo agreement renewed for further three years on old basis."

Definite inclusion of the Mitsui interests did not take place until 1934. In the meanwhile Mitsui had achieved sufficient position in the Japanese market so that when the importers proposed that they receive a one-third quota, Mitsui countered with an offer of 20 percent participation. The main consideration on the part of the cartel and National was the ultimate objective of Mitsui. This is indicated in the following excerpt from a letter of Lumley to Ellis, dated January 26, 1934 (exhibit 59):

"The conversations with Mitsui which began in the way described developed until they finally veered around to the present discussion regarding quota. At this point, recall that the present understanding runs for six months only. It is the Cartel idea that this six months is in the nature of an armistice during which a status quo will be preserved by mutual consent in Japan; it is also the Cartel idea that either during this six months' period or at any rate along toward the end of the period it may be possible to get Mitsui to discuss the question in which the Cartel is really interested, namely, Mitsui's ultimate indigo objective. As the six months' period draws to a close the question will naturally arise "what next?" In this situation Mitsui will also naturally be willing to discuss the status at least in Japan and the Cartel hope that at that time the question of world status and arrangements may be successfully introduced. At any rate it has been made plain to Mitsui that importers will not continue the present arrangements unaltered after the expiration of the present period. More particularly importers will not agree to continue to abstain from importing further supplies into Japan. The Cartel considers that discussions regarding this question of future imports by importers into Japan will afford a favorable opportunity perhaps of suggesting to Mitsui that it may be possible to arrange nonimportation into Japan under certain conditions. The next step is to discuss what these conditions are. Mitsui may be willing to enter into this discussion. If not, at any rate, nothing is lost.

"From full discussions with the Cartel representative here I gathered that this is the main consideration which induces the European Cartel to favor the present Japan quota arrangements with Mitsui, namely, that it furnishes an avenue of approach to discussions with Mitsui which may lead to Mitsui's stating definitely what is their ultimate world indigo objective. And I gather that the Cartel is most anxious to get Mitsui to enter into a discussion on this subject with the idea that possibly Mitsui may finally be bound to some ultimate maximum indigo production; naturally, the hope of the Cartel is that it will be possible to make such a maximum acceptable to the Cartel."

Digitized by Google

In February 1934 Lumley wrote to Ellis enclosing a copy of a letter from one G. Kuhweide, representing the indigo importers to Japan, to Mitsui, dated January 27, 1934 (exhibit 60). This enclosed letter which is in the nature of an agreement by these parties, states in part as follows:

"I recapitulate the terms of the agreement herewith: The indigo sales are to be carried on, insofar as the goods are to be consumed in the present territory of the Empire of Japan, including Taiwan and Chosen, in such a manner that of the total sales: 75% are to be supplied by Mitsui, and 25% are to be supplied by the four foreign factories.

* * * * * * *

"The share of 25% will be divided amongst the 4 foreign factories by their Japanese representatives.

* * * * * * *

"Prices: On the 1st of February the following price increase will be made: Mitsui, Yen 10.—per 112 lb. 100%; Imported Indigo, Yen 5.—per 112 lb. 100%.

"*Terms of the agreement.*—6 months from the 1st of February 1934.

"It is mutually understood that the present agreement is without prejudice to any final settlement of the whole Indigo problem which may be come to at a later date."

This agreement was subsequently extended through May 1935 (exhibit 61).

A letter from W. W. Hoag, assistant foreign sales manager of National, to Talbert, general manager, dated May 16, 1935 (exhibit 62), indicates that by a new agreement Mitsui was alloted 85 percent of the Japanese indigo market.

On September 30, 1937, a cable (exhibit 63) was sent to Mr. Lumley at Kobe stating: "Existing indigo arrangement has been renewed without change for three years ending December 31, 1940."

On November 19, 1938, B. A. Ludwig, president of National, in a confidential letter to Talbert (exhibit 64), stated as follows:

"Mr. TALBERT

JAPAN—MITSUI

"Director Hoppen of the I. G. will reach Japan on Dec. 6th to discuss with Mitsui a renewal of the Indigo agreement. This agreement will be extended to the end of 1940 on practically the same basis as previously, with the exception of:

"Mitsui's desired participation in markets other than China and Japan. The negotiator will endeavor to restrict Mitsui to Dutch East India and British India, allowing the necessary small quantity, that is, not exceeding 20 tons for Dutch East India, 100%; 30 tons for British India—basis. Only, however, if they are hard pressed are these concessions to be made.

"Another question which will come up and to which the negotiator will strenuously object, is the claim made by Mitsui to be credited with the undelivered portions of their Indigo quota during the war in China.

"Inasmuch as the du Pont Co. is not interested in either British India or Dutch East India, they will not participate in the sacrifice that we may have to make.

"The old agreement with Japan having 85% and the other parties 15% still stands, but if the 15% is not taken up by the other parties, Japan will want the difference.

"Another point that Mitsui may possibly raise, and which will be firmly objected to, is a request for a guaranteed minimum quantity disregarding the actual consumption of Indigo in these markets. They can only continue on basis of a quota which is calculated on the actual consumption of Indigo in these markets during the year.

"Inasmuch as these propositions and discussions are of great importance, I have authorized the acceptance for Nacco, and Director Hoppen will negotiate on the basis stated above.

"Please arrange to advise Mr. Fistrere and Mr. Lumley accordingly.

"———— ————, *President.*

A letter from Ellis to Talbert, dated November 21, 1938 (exhibit 65), states that National has 20 percent of the 15 percent allocated to the importers, i. e. 3 percent of the entire Japanese market.

In 1939 Japan demanded increased participation in the dyestuff markets in the Dutch East Indies, China, India, and Manchoukuo. Mitsui also in effect excluded the importers from Japan. A letter from Lumley to Ellis, February 16, 1939 (exhibit 66), states in part:

Digitized by Google

"*Japan.*—Mitsui state that as the Government will not license Indigo imports, they are not willing to make any agreement covering Japan.

"*Dutch East Indies.*—Mitsui demand a quota for 1939, 15 tons and for 1940, 20 tons of Indigo 100% basis.

"*British India.*—Mitsui demand a quota of 20 tons for 1939, and 30 tons for 1940, of Indigo 100% basis.

"*China and Manchoukuo.*—Mitsui demands a quota of 40,000 piculs for 1939, and 50,000 piculs for 1940, 20% basis.

* * * * * * *

"For all other countries except those specified above, Mitsui demand a quota of 15 tons per year 100% basis; Mitsui to be free to export to any country they choose."

3. *India*—1931 was also the year in which cooperative activity apparently commenced with respect to the Indian market. This followed the patterns described for the Chinese and Japanese markets; i. e., market allocation and price fixing.

On September 28, 1931, F. S. Kerr, National's agent in Bombay, cabled his home office for instructions regarding a proposed price increase (exhibit 67):

> "Contacted with competition Saturday and today. Stop. I. G. proposed increase in price immediately as naphthols by 30%, sulphur blacks by 52%, indigo-alizarine, and all other colors by 25%.
>
> "Ciba, Sandos (sic), British Alizarine—all agree to above. Stop.
>
> "I. C. I. have instructions that if I. G. and we initiate increase in price they are to follow to extent of 25% on Alizarine and 10% on all other colors. Stop.
>
> "I. C. I. telegraphing for instructions regarding DuPont. Stop.
>
> "All competitors except I. C. I. agree to immediately increase 25% on Alizarine and 15% on all other colors wherever possible with the object of increasing by 25% eventually. Stop.
>
> "I. G. telegraphing home office today to endeavor to persuade I. C. I. to follow up to 25% increase on all colors. Stop.
>
> "I. G. have increased price Sulphur Blacks by 52% except outstanding contracts and believe I. C. I. will follow if we do. Stop.
>
> "I. C. I. have instructions not to increase price of nonmoving colors since they believe this is good opportunity for clearing. Stop."
>
> We have not committed ourselves. Telegraph instructions.

On this message, Talbert wrote the following note:

"Mr. Ludwig: This is good news. The next step it would seem to me before agreement would be some statement as to market participation, du Pont & I. C. I. now being partners, and if du Pont can follow their usual plans of agreement on price this looks even better. If status quo can be maintained for a given period and then a new market division arranged on a sound basis, I recommend your approval.

"G. W. T. 9.29.31."

Approval of the proposed agreement was cabled to W. Wickersham in Bombay, November 20, 1931 (exhibit 68), "with the understanding that agreement * * * can be cancelled by us at any time * * *"

In 1933 American Cyanamid, through its Calco Chemical Division, attempted to obtain a foothold in the Indian market. Mr. Kerr was now Calco's agent, and his efforts met with resistance from Havero (I. G.'s agency in India) and National. Havero's policy was to keep Calco out of the market entirely. This is indicated in a letter from A. C. Lumley, National's Far Eastern representative, to Ellis, in New York, April 4, 1933 (exhibit 69), in which Lumley proposes limited cooperation with Calco:

"Mr. Seyd (I. G. Representative) stated that Havero's policy is to put every possible obstacle in the way of a new vendor like Mr. Kerr entering the market; that when Mr. Kerr has demonstrated that he cannot be kept out of the market, then will be time to consider cooperation with him.

"Havero state that telling Mr. Kerr their prices would be equivalent to broadcasting them. They do not trust Mr. Kerr to make proper use of such information, and therefore they do not intend to give it to him.

"Mr. Kerr has not yet come to us for any information regarding market prices. If he does come later on under circumstances which convince us he is really

Digitized by Google

trying to avoid price cutting, we think it might be advisable to help him to avoid underselling the market.

"Furthermore, if we find that Mr. Kerr is selling below the market, we believe it will be in order to call the facts to his attention.

"We cannot entirely condemn the Havero point of view; but it will be to the advantage of all concerned if we help Mr. Kerr to avoid unnecessarily undercutting established market prices."

Ellis also advocated cooperation in a short note to Talbert, May 1 1933 (exhibit 70) reading in part:

"If we adopted Havero's policy then F. S. Kerr might do a lot of damage by obtaining low-priced business which would simply contribute to the very unfortunate situation that now exists with the repackers.

"It is therefore recommended that Mr. Lumley initiate discussion with F. S. Kerr when he can find actual cases of Mr. Kerr under quoting the market. Mr. Lumley also to be told that we are desirous of knowing Mr. Kerr's reaction to such advice."

Ludwig, president of National, favored following Havero's proposal to keep Calco out. To Talbert, he wrote as follows on May 2, 1933 (exhibit 71):

"I am not in favor of approaching Mr. Kerr at this time. According to Mr. Lumley's statement, he has not sold anything so far, and inasmuch as we are now cooperating with Havero, it is necessary that we follow the same policy suggested by them, namely not to permit Mr. Kerr to gain a foothold in India. If we assist him by any kind of cooperation, we shall have to figure on this participation at a later date. This is exactly the same situation as we are now facing with Dow in China. From Mr. Lumley's letter it is evident that Havero is absolutely opposed to dealing with Mr. Kerr."

And, accordingly, Ellis wrote Talbert on May 8: "Advice is being sent to Mr. Lumley to follow the Havero plan" (exhibit 72).

The effect of new competition was indicated the following year, 1934, when Russian dyes began to reach India. On July 26, Lumley, Far East division manager, advised Ellis (exhibit 73) of this Russian competition and stated that it required price adjustment to meet it. He added:

"Bombay request authorization to sell at the new prices noted. The cartel representatives are simultaneously requesting similar authorization. In order to hold our established position in these colors, and also to combat the introduction into India of the Russian types, it is recommended that the requested prices be authorized, if the cartel representatives sell at corresponding prices."

It is desirable that the new prices, if authorized, be issued before the end of July.

A new quota allocation for the Indian market was established in 1937. On June 30 Ellis cabled Wickersham (exhibit 74):

"*Indigo 60% Grains.*—Effective April 1, sales quota, Cartel 90%, National 10%. Stop.

"July 1 and tenth day each month thereafter exchange figures stock arrivals sales."

This cable was confirmed by letter of the same date from Ellis to Wickersham (exhibit 75). In further clarification, it is stated:

"Each party shall continue as heretofore the relative sales in different districts in the same proportion as in the past, but a certain latitude is, of course, allowable.

"Selling prices to be arranged between both parties in Bombay, so that the above-mentioned selling quotas can be maintained.

"The plan is to continue for three years, from April 1, 1937, to March 31, 1940, and thereafter from year to year unless either party is dissatisfied, in which event a three months' cancelation notice will be served before March 31, of a respective year."

The import of the Japanese in the Indian market is revealed in the following exchange of communications. On August 2, 1939, H. E. Lorenz, National Agent in Bombay, cabled (exhibit 76):

"Japanese request 4 annas gap [meaning a price differential] selling price Japanese-European Cartel Indigo—local European Cartel agreeable—may we agree? Telegraph."

Talbert recommended to President Ludwig (exhibit 77) that National should not consent to this means of furthering Japanese interests; but Ludwig, mindful of cartel commitments, replied:

"I quite share your sentiments, but having agreed on a differential in China and Europe, I do not see how we can avoid granting this request."

Digitized by Google

Accordingly, the following cable to Lorenz in Bombay was approved (exhibit 78):

"Refer to your cable of August 2, 4 anna differential—we agree."

A note from Ellis, foreign sales manager, to Talbert, August 2, 1939 (exhibit 79), clarifies the significance of this so-called gap or differential. He writes:

"This entire plan is the outcome of the original negotiations in Japan when, as I recall, approval was not only given for Mitsui to sell Indigo in Belgium, Dutch East Indies, Singapore, India, and Mexico, but also at 'an introductory allowance.'

"The introductory allowance is, of course, the same as the 'gap' mentioned by Mr. Lorenz, or my phraseology of 'differential.'

"Furthermore, we agreed to a differential in Belgium on July 21, 1939. * * *"

The foregoing clearly establishes the presence of quota and price-fixing arrangements for the Indian market. The 1937 agreement between National and the cartel was intended to operate through 1940, so that the existence of these cooperative endeavors over the 10-year period since 1931 is clear. It is significant that du Pont was not a party to these agreements—you will recall that I have explained previously that du Pont transferred its Indian business to I. C. I. in 1931, and the latter company apparently was a party in the negotiations just reviewed.

4. *South America.*—Similar organization of the market by the cartel and certain American producers took place in South America, particularly in Argentina and Brazil, two large consuming nations, which, because they were also nonproducers, lent themselves well to the type of arrangement in evidence in far eastern markets.

Pursuant to the policy of collaboration in markets not exclusively reserved to either party, enunciated in their 1929 agreement, du Pont and I. C. I. established during the 1930's jointly owned companies in Argentina and Brazil for the advancement of their mutual interests in those countries. A memorandum on The Duperial Companies, as these amalgamated interests were called, prepared by W. H. Coates of du Pont in 1938, explains the reasons for the formation of the companies (exhibit 80):

"(*a*) Both du Pont and I. C. I. were looking to a considerable expansion of their respective volumes of sales in these countries;

"(*b*) Concerned to a large extent with the same products, some clash of interest appeared likely, which in view of the general relations between the two companies it was desirable to avoid;

"(*c*) It was felt that an amalgamation of interests would strengthen the power of both companies to continue their policy of expansion in South America; and

"(*d*) It was recognized that the growth of economic nationalism would tend to involve the continued expansion of manufacture on the spot."

In the Argentine and Brazilian markets, arrangements between the cartel, Duperials, and National did not include quota allocations; this for the reason that the Duperials had not been engaged in business for a sufficiently long time to determine accurately the extent of their participation. But there was no lack of cooperative endeavor.

Argentina.—On November 7, 1935, National sent a cable to F. H. Coe, its representative in Buenos Aires:

"Meet Mr. Brugemann with friendly cooperation; stabilize colors which outside competition have disrupted."

Mr. Brugemann was the I. G.'s Argentine agent.

A letter of the same date confirmed this cable and in further explanation added (exhibit 82):

"* * * The main colors in which interest has been shown are those which du Pont have actively endeavored to attain a position in, to the detriment of both our and I. G. sales.

"We understand that Mr. Brugemann will take the initiative in suggesting prices in local currency in accordance with the list attached. It is our understanding that the representatives of du Pont in Buenos Aires will maintain such established prices.

"We therefore request that in discussions with Mr. Brugemann you cooperate in order that a higher level of prices be established which will not be upset by price cutting tactics on the part of outside competitors."

Digitized by Google

On December 3, a cable was received from Coe (exhibit 83) indicating that the suggested stabilization had been reached:

"According advice received from Brugemann yesterday all suppliers including du Pont agree minimum price four pesos ninety-five for all 200% Direct Blacks. Stop

"He stated their previous price Alpargatas to be now invalid from which I assume he will quote agreed price. Stop."

There is attached to this document a list of corresponding I. G. and National colors, together with the prices to be charged for each.

A letter from Coe to W. Hoag, National's assistant manager of foreign sales, February 26, 1936 (exhibit 84), contains a summary of discussions attended by representatives of du Pont, Geigy, I. G., and National. Agreements respecting action on certain specific colors was reached. Furthermore—

"Dr. Oberhoff (of I. G.) suggested the thought that we should be careful not to place our agreed prices too high in order that additional suppliers might not be attracted to the market. He mentioned specifically Holliday and the Japanese. Mr. Swezey (of du Pont) informed me personally that it was his understanding that the Japanese plan to appear in this market with dyestuffs in April or May of this year. With this information, the wisdom of maintaining reasonably low prices becomes obvious.

"After some opposition from Mr. Brugemann (of I. G), it was agreed that representative samples of the colours involved in the agreement should be exchanged between the I. G., du Pont, and ourselves. Tests of these samples are to be made independent and the results discussed at a later date.

* * * * * * *

"It was agreed that the duration of the agreement should be for one year, and that during this year the local representatives of the companies concerned should arrange to meet at intervals of about two months for an informal discussion of whatever problems might arise. These informal discussions are not intended to replace the use of immediate discussions in case of any violations of the agreement.

* * * * * * *

"Adjusted prices for Uruguay are to be discussed this week."

A letter from Coe to Hoag, dated March 10, 1936 (exhibit 85), states that an agreement embodying the terms agreed upon had been concluded, and a copy thereof was attached to the letter.

On April 9, 1937, C. A. Langensiepen, I. G. agent in Argentina, informed E. R. Ellis, foreign sales manager of National, that (exhibit 86)—

"* * * it was unanimously decided at yesterday's meeting in Buenos Aires to continue the agreement of March 10th, 1936."

On July 5, 1938, C. W. Kates, acting branch manager, wrote to Ellis regarding another conference between representatives of I. G., Duperial, and National (exhibit 87):

"Discussion was centered around two main recommendations: (1) To inaugurate a new system for calculating prices; (2) to include new products either in the present agreement or in an additional agreement. Also discussed were Sulphur and Direct Blacks as of our letter dated May 17th, 1938.

"The discussion concerning new products was long and the arguments many. Messrs. Lank and Buescher were very anxious to include Acid and Chrome Blacks, but the I. G. were reluctant to even considering the suggestion, claiming (1) the French and Swiss would probably not sell anything but their regular types, which are imported 'as is' and have been sold in that manner since they entered this market, (2) because there were so many classes of concentrations it would be extremely difficult, if not impossible, to calculate a Standard. Mr. Kinsman (an official of the du Pont Company) stated the problem had been solved in the States, therefore he could see no reason why it could not be solved here."

This last statement by Kinsman concerning calculation of standards in the United States is especially significant and will be subsequently referred to when the domestic market is further examined.

A final letter respecting the Argentine picture from Ellis to A. R. Edwards, then manager of National's Argentine branch, dated September 26, 1940 (exhibit 88). Ellis stated that a National representative had met in New York

Digitized by Google

Mr. Salmon, managing director of Duperial, of Argentina, and another individual "whose name it is not necessary to mention at this time," and further—

"* * * He (Salmon) is naturally interested in better prices; so are we; and he was told the best way to obtain better prices is for him to take the initiative and that you would certainly be happy to follow. It was also suggested that if he and Mr. Lank saw you more frequently and did not rely upon information furnished to them by Mr. Buescher (or I. G.), or any other of their salesmen, no doubt an improvement could be effected.

"Mr. Salmon was told frankly that we were not interested in any written arrangement; furthermore, that the plans toward improvement must be done "on the ground," i. e., in Buenos Aires, where it is felt the direct representatives have a more intimate knowledge from which a more consistent understanding could be reached. However, it was reiterated that nothing in writing was wanted, and, specifically relating to your letter, the plan outlined is a close copy of the China arrangement.

"The writer is not in a position to authorize you to apply the China plan to the Argentine, Uruguay, or any other South American country.

"You and your contemporaries should be in a position to establish market prices based upon definite strength determination of color, which prices should be followed by you if such an understanding is reached. But if you have any indication that a contemporary is not adhering to such prices, then immediately revert to the prices prevailing before any arrangements were established."

Brazil.—The same type of market situation has pertained in Brazil. On December 24, 1932, Ellis wrote Talbert, general manager of National, enclosing a copy of a letter from Langensiepen (of I. G.) to John Jurgens & Co., representatives of National in Rio de Janeiro, November 10, 1932, which indicates an agreement to raise the prices of certain dyestuffs 20 percent.

"The 20% price increase desired by the principals will cover all dyestuffs of the Direct Black, Direct Blue, Direct Brown, Direct Red, Acid Orange, Nigrosine groups which have been introduced or manufactured in Brazil by the representatives of the I. G., Ciba, Geigy, Sandoz, Kuhlmann, Nacco, and Acna (of Italy) Messrs. John Jurgens & Cia and Falzoni also include themselves in this agreement for their Cubachrome and Enia dyestuffs.

* * * * * * *

"If the representatives should meet with resistance on the part of a customer, they will hold a confidential meeting among themselves to handle this particular case in an equitable manner. In such case, the firm of John Jurgens and Co. will employ the Allica Commercial de Anilinas Ltda as mediator.

"This agreement is to be held strictly confidential in its entirety, and the representatives bind themselves to strictest secrecy."

A subsequent letter, November 25, between the same parties states:

"After the foregoing agreement between the individual principals and a unanimous agreement between the following representatives, John Jurgens & Co., Allianca (I. G. agency), Klinger & Ci. Gulherme Humizach A. Schumtziger (Swiss agency), Dr. E. Vella (French), and A. Falzoni (Italian) was arrived at, in connection with my arrangement with the above representatives, the 20% increase in the f. o. b. prices of the groups Direct Black, Direct Blue, Direct Brown, Direct Red, Acid Orange, and Nigrosine will be effective as of December 1st of this year for the whole of Brazil."

These letters form exhibit 89.

A letter from Ellis to Ernst Gobel, of the Jurgens Co., dated May 9, 1934, states that (exhibit 90):

"Mr. C. A. Langensiepen, of I. G., is leaving here Saturday, May 12, on the S. S. 'Southern Cross,' charged with the mission of effecting an increase of 20% in selling prices in Brazil.

"We understand that he will negotiate with you along these lines, contingent upon a distinct understanding that there will be no forward contracts negotiated, written, or accepted in any form. Also, that the date on which the new prices will become effective will be subject to agreement between you and Mr. Langensiepen.

"Furthermore, it should be distinctly understood by you and by him that the new prices can be reduced if, in your judgment and the judgment of Mr. Langensiepen's representatives in Brazil, such reduction in prices is appropriate to meet so-called 'outside' competition."

Digitized by Google

In 1936 du Pont and I. C. I. organized the Duperial Co. of Brazil, which, however, did not actively commence business until the following year (exhibit 91).

Concerning the effect of the entry of Duperial into the Brazilian market "Companhia" (probably John Jurgens) wrote National, June 26, 1937 (exhibit 92):

"Gentlemen, we beg to inform you that in the meantime the new combine between the Imperial Chemical Industries and du Pont has been established under the name of

"*Industrias Chimicas Brasileiras 'Duperial' S. A.*—You may see all details from the attached cut of the Official Paper. As we already told you in a previous letter, there happened some nice competition fights between the I. G. and 'Duperial,' principally in Sao Paulo. Certainly we shall have some troubles, too; but, in order to be prepared, it is absolutely necessary to be provided with sufficient stocks."

A memorandum from Ludwig to Talbert, November 28, 1938 (exhibit 93), makes this reference to the Argentine and Brazilian market situation:

"The quota basis seems to appeal to the I. G. very strongly. Since they have the majority of the business, a *status quo* would of course be acceptable to them, but hardly acceptable to other concerns interested in doing business with these countries."

On the following day, November 29, Ellis referred to this memorandum in a note to Talbert (exhibit 94):

"Du Pont are alleged to have made the statement that any quota to them less than 20% would be unsatisfactory, in contrast to their present participation of both markets, said to be between 8% to 9%.

* * * * * * *

"If a quota is contemplated, it should be based on the exclusion of those colors which National does not now offer in both markets, so that the way would be open in the future for National to strive for a portion of the market exclusive of any quota restriction if, as, and when National found it possible to offer any or all of this type of colors."

The full extent of cooperation with the cartel in South America is singularly evidenced by an excerpt from the "Semiannual report of foreign relations department" of du Pont, dated February 9, 1940 (exhibit 95). In a paragraph relating to I. G. Farbenindustrie, it is stated:

"I. G. have given evidence of the adoption of a policy of industrial development in South America through purchase of the Fluminense caustic-chlorine plant in Brazil and of shares of the Electroclor Company in Argentina. Arrangements have been made for the repayment to the I. G. of money advanced to Duperial for the purchase of shares in the latter company as it is impracticable for I. C. I. to be in partnership relationship with a German Company. *The du Pont Company informed I. G. that they intended to use their good offices after the war to have the I. G. participation restored.*" [Italics supplied.]

The inference which may be drawn from this last sentence requires no additional comment.

5. *England.*—I should like to call your attention to one further export situation. You will recall that through the over-all agreement executed by du Pont and I. C. I. in 1929, England was reserved as exclusive territory for I. C. I. Furthermore, when I. C. I. joined the European cartel in 1931, I. G. Farben agreed to withdraw from the United Kingdom except for sales through I. C. I. (refer to exhibit 27 supra). Furthermore, General Aniline and the Swiss were restricted from sales outside the United States which precluded them from trading in England. The following documents support the conclusion that National stayed out of the United Kingdom also.

On June 16, 1932, Ellis, foreign sales manager of National, wrote Talbert, general manager (exhibit 96), concerning extension of sales activity in the British Isles. This letter states in part:

"Nearly five years ago an investigation was made to determine the feasibility of our establishing either a branch or agency in England, Ireland, Scotland, and Wales. In the midst of our investigation advice was given to me orally by Mr. Vermilye [a director of Allied Chemical and Dye Corporation, owner of National] to cease all efforts in this direction unless I. C. I. entered the United States market."

Digitized by Google

The reason for this early abstention from the English market may have been the ownership of a substantial block of Allied stock by I. C. I. And in 1935, the possibility was again broached in a letter from H. C. Pennrich, National's European manager, to Ellis (exhibit 97). At this time the British requirement of obtaining an import license before importing was about to expire. On this letter, Talbert added the following note, dated September 25, 1935, which intimates that National's policy was not based on British legislation:

"Mr. ELLIS: The answer is *No* and in about that character—Contact develops the fact that previous instruction has not altered nor is it likely to—i. e.—stay out of England—etc., etc. Please see that Mr. P. [Pennrich] does not contact nor promote his ideas on this matter.

"G. W. T. 9-25-35."

In 1936, a distinction was drawn between the sale of dyestuffs and of intermediates, and Ludwig, president of National, authorized the sale of beta-oxynaphthoic acid in England, despite Talbert's advice, May 26, 1936.

"My ruling in view of my instructions from Mr. O. F. W. [O. F. Weber, officer of Allied Chemical & Dye Corporation] would be to sell nothing in England until that ruling had been changed."

Ludwig's instructions were:

"Mr. TALBERT:

"ENGLAND

"Mr. Ellis's note of the 25th.

"My recollection of the talk with Mr. OFW is that there was no intention on the part of AC&D to sell dyes especially, direct from New York to England. There is no ruling on intermediates from our European office to England or elsewhere, and although the first order passed through without my approval, I see no objection now to continue the sales of this intermediate if it can be sold at a good price.

"[Signed] B. A. LUDWIG."

These notes, including that of Ellis, referred to by Ludwig, constitute exhibit 98.

Apparently, Ludwig made a further experiment and decided to approve shipment to England from National's European office, though not from the United States. However, it is clear that no dyes were exported to England from any point.

V. METHODS OF FOREIGN CONTROL IN UNITED STATES

1. *General Aniline & Film Corporation.*—In an earlier section of this statement I related how German and Swiss interests re-entered the United States market after the end of the last war, and how the I. G. successfully overcame the barriers erected to keep it, and its predecessor companies before their amalgamation into the I. G., off the American dyestuff stage. Neither seizure of German patents during the war, establishment of the Chemical Foundation, nor imposition of high tariff walls achieved their intended objectives. I have recited the various agreements executed by the I. G. and its predecessor companies with Grasselli Chemical and Grasselli Dyestuff in this country, and the establishment in 1925, of General Dyestuff Corporation as the exclusive selling agent for the products manufactured by Gasselli Dyestuff (renamed General Aniline Works, Inc., in 1929) and those imported from the I. G. I also mentioned the organization by Hermann Schmitz, in behalf of I. G. Farben, of American I. G. Chemical Corporation in 1929, to which the stock of General Aniline Works was transferred, and in 1939 of General Aniline & Film Corporation into which American I. G. and General Aniline Works were merged. At this point, I wish to detail more specifically the organization and structure of these companies, and their importance to I. G. Farben during the succeeding period.

The organization and control of American I. G. and its successor, General Aniline & Film, is an interesting sidelight on the central picture I have been developing. This has been the unit through which control of I. G.'s enterprises in this country has been maintained, and clearly illustrates the means and methods used to achieve an effective liaison between the two groups.

The stock authorization of American I. G. was 3,000,000 common, A shares and 3,000,000 common, B shares. In return for its stock interests in General

Digitized by Google

Aniline Works, an Agfa-Ansco Corporation,[1] plus $10,000,000 cash, I. G. Farben received all the B shares and 400,000 A shares, which latter class participated in dividends at a ratio of 10 to 1 over the B shares. Thirty million dollars of convertible bonds were sold to the American public; there were guaranteed as to principal and interest by I. G. Farben, which received, in return, an option to purchase an additional 1,000,000 A shares.

In 1928, Hermann Schmitz, financial director of I. G. Farben, had organized in Switzerland, a company known as I. G. Chemie (Internationale Gesellschaft fuer Chemische Unternehmungen, A. G.), the purpose of which was to serve as holding company for I. G.'s widely extended interests outside Germany. Hermann Schmitz served as president of I. G. Chemie until sometime in 1940, and the management of the company has always been composed of individuals closely connected with I. G. Farben. The latter guaranteed certain dividends on I. G. Chemie stock, and received in return an option on the assets and property of I. G. Chemie at book value, which guarantee and option continued until 1940.

I. G. Chemie had always held control of the A shares of General Aniline & Film Corporation, until the recent seizure of the foreign-held stock of General Aniline by the Secretary of the Treasury, at which time I. G. Chemie owned 388,816 out of 529,270 A shares outstanding. Also outstanding were 2,050,000 B shares. In the treasury of the corporation were 430 plus shares of A stock and 950,000 shares of B stock.

The record holders of the stock as of October 1, 1941, and the number of shares standing in their names, are listed in an affidavit prepared by the corporation in December 1941 submitted to a court of chancery in Delaware to show cause "why a master should not be appointed at this time to hold a special meeting of stockholders of General Aniline & Film Corporation to elect a board of directors" (exhibit 99). All of the 2,050,000 B shares and at least 487,065 A shares were held by or for nationals of the Netherlands, Switzerland, or Germany; i. e., 98+ percent of all outstanding shares.

Furthermore, General Aniline held a substantial block of the stock of I. G. Chemie. In 1940 it owned 84,900 shares of common stock out of 250,000 shares outstanding.

The management of General Aniline has always been dominated by I. G. or former I. G. officials. Hermann Schmitz served as president from 1929 to 1936, when he was succeeded by his brother, Dietrich A. Schmitz, a naturalized American citizen, who occupied the presidential office until the fall of 1941. Hermann Schmitz was chairman of the board of directors from 1936 to 1939. The original board of directors of General Aniline contained 14 persons, of which 9 were or had been members of the board of I. G. Farben (Hermann Schmitz, Carl Bosch, Max Ilgner, Fritz ter Meer, and Wilfred Greif), or had been previously employed by I. G. Farben in Germany or as representative in this country (Walter Duisberg, Adolph Kuttroff, W. H. vom Rath, Herman Metz). A tenth, W. E. Weiss, through Sterling Products, had been under contract to I. G. for some time. The remaining four members were representative American citizens: C. E. Mitchell, chairman of the board of National City Bank; Edsel B. Ford, now president of the Ford Motor Co.; W. C. Teagle, now chairman of the board of Standard Oil of New Jersey; and Paul Warburg, chairman of the board of Bank of Manhattan Co.

During the period 1929–39 changes took place in the constitution of the board and the number of directors varied, but a majority of the directorate were at all times individuals with I. G. backgrounds or connections. In 1939 an effort was made to give the board a more American complexion, but, despite the resignation of Hermann Schmitz, Carl Bosch, and Walter Duisberg, and the appointment of 7 new directors, 7 of the then 12 members belonged to the I. G. group. This predominance increased during 1940 and 1941 when certain directors, including Edsel Ford, resigned.

The following chart is a list of the directors of General Aniline from the time of its organization in 1929 until 1941; the period of time served and the nature of connection with the I. G., where such existed, are indicated.

[1] Organized in 1928, through merger of German Agfa's interests in United States and Ansco Corporation, an American manufacturer of photographic materials. In 1929, as indicated, American I. G. acquired I. G. Farben's interest in Agfa-Ansco. Thus, achievement by I. G. of control of an important part of the American film industry was similar to development of control in dyestuffs.

Felix Iselin (S)	1940–1941		President of I. G. Chemie, 1940–date

G: German citizen.
N: Naturalized citizen of United States.
S: Swiss citizen.

Exhibit 100 is an analysis of dividend payments made by General Aniline from November 1934 to December 1940.

In January 1941, I. G. Chemie, anticipating seizure by the Alien Property Custodian in the event of war between the United States and Germany, proposed to create in this country a voting trust of 1,550,000 B shares owned beneficially by two Netherland corporations. Its application to do this was formally rejected by the Government through the Department of Justice in May. Then, I. G. Chemie proposed to sell controlling shares to General Dyestuff Corporation and rejected a suggestion emanating from General Aniline & Film that these shares be sold to some representative American purchaser whom General Aniline was proposing. The board of directors of General Aniline opposed this transfer to General Dyestuff; D. A. Schmitz, the president, however, advocated the deal, and he was ousted from office by the other directors in September 1941. (On October 2, the Treasury Department denied the application of General Dyestuff Corporation for permission to purchase the 1,550,000 shares from I. G. Chemie.)

A schism developed between certain groups on the board, on the issue of foreign control, and certain other directors were ousted from offices they held. Former Judge John Mack was elected president, and other distinguished American citizens, including former Ambassador William Bullitt, were invited to become members of the board. An effort was made to buy the foreign-held stock of the corporation which constituted approximately 97 percent of the outstanding shares. Finally, in December, representatives of the Treasury Department took over the corporation. More recently, Secretary Morgenthau seized these foreign holdings for which he was to act as trustee; the entire board of directors was removed; and a new board of four members appointed to operate the company. Subsequently, these properties were transferred to the Alien Property Custodian. Meanwhile, investigation continues.

2. *Control of General Dyestuff Corporation.*—At the time of the organization of General Dyestuff Corporation in 1925, its stock was allocated, as indicated previously, to the holders of stock in the companies whose selling interests were merged into General Dyestuff, i. e., Grasselli Chemical which transferred the sales branch of Grasselli Dyestuff, H. A. Metz, exporter of Hoechst products, and

Digitized by Google

Kuttroff-Pickhardt & Co., representatives of Badische. When Grasselli Chemical sold its interests in Grasselli Dyestuff and General Dyestuff to Metz in 1928, at the time its other assets were sold to du Pont, Metz became owner of a majority interest in General Dyestuff.

Metz held control in this manner until March 31, 1931, when he sold his stock interest which was then 4,100 out of 6,000 shares, to D. A. Schmitz for $410,000, which sum was loaned by Ed. Greutert & Cie, Swiss bankers for I. G. Farben, who financed many I. G. Farben deals in this country. D. A. Schmitz held this stock personally for 2 years, then optioned it for a very nominal consideration to the Marion Co. which he personally controlled. The Marion Co. held this option until 1939 at which time D. A. Schmitz sold his interests back to the corporation. A chief reason for this action was receipt of legal advice that Schmitz might subject himself to a stockholder's suit by holding control of General Dyestuff while serving as president of General Aniline. When General Dyestuff acquired this stick, it sold 1,400 shares to E. K. Halbach who had been president of General Dyestuff since 1930 at which time Herman Metz had become chairman of the board of directors. The acquisition of these shares gave Halbach control of the corporation and at the present time he owns 3,150 of the 5,910 shares outstanding. Approximately 25 percent of the shares were purchased by Walter Duisberg, previously identified as a director of General Aniline from 1929 to 1939.

Until 1939 several of the officer directors of General Aniline also served in similar roles in the management of General Dyestuff.

	G. D. C.	G. A. & F.
Rudolph Hutz	V. P. and Dir. 1925–1939	V. P. 1939–1941.
W. P. Pickhardt	Dir. 1938–1939	Dir. 1939–1941.
A. Kuttroff	Dir. 1925–1926	Dir. 1929–1930.
D. A. Schmitz	Dir. 1931–1939	Dir. 1934–1941, Pres. 1936–1941

E. K. Halbach, who has been president since 1930 and who has held control of a majority of the stock since 1939, was formerly an employee of Kuttroff-Pickhardt & Co., and has always been closely associated with I. G. Farben or companies controlled by it.

3. *Swiss companies.*—Ownership of the Sandoz and Geigy companies in this country has continued to remain in the Swiss parents of these companies. However, during the period 1927–29, Ciba Basle transferred many of its holdings in the New World to Anglo-American Chemicals. Then, after the outbreak of the present war, in anticipation of German invasion of Switzerland, two trusts were set up, in Canada and the United States, respectively, to which were transferred Anglo-American Chemicals and Ciba's other enterprises. So that, at the present time, ownership of Ciba, New York, and the 52 percent of Cincinnati Chemical Works held by Ciba Basle, is now in these trusts, which were established irrevocably for 21 years with Ciba Basle as beneficiary.

VI. EFFECTS OF WORLD WAR II

1. *Release of General Aniline and General Dyestuff from export restriction.*—From 1925 to 1939 General Aniline and General Dyestuff lived up to the terms of their agreements. For example, on June 23, 1939, General Dyestuff wrote to Pacific Commercial Co., New York City (exhibit 101):

"We are in receipt of your letter of June 22nd, inquiring for quotation covering 100 kilos RAPIDOGEN DEVELOPER M.

"We regret to advise that we are unable to quote on this item inasmuch as we are not able to export.

"We have taken the liberty of passing your inquiry on to Menzi Company, Inc., 180 Juan Luna, P. O. Box No. 609, Manila, Philippine Islands, which we trust will be satisfactory."

Another example: General Dyestuff to Carr Bros., Inc., New York City, January 30, 1940 (exhibit 102).

"Referring to your letter of January 24th, we regret to advise that we are unable to offer our dyestuffs to be exported to Cuba. We understand, however, that Mr. Albert Eppinger, Apartado 2505, Habana, Cuba, has a large stock of dyestuffs and could possibly offer to your customers."

Digitized by Google

Despite the fact that Cuba had been released by this time, General Dyestuff still showed reluctance to ship, probably because of Eppinger's large stock on hand.

However, in September 1939 the I. G. was cut off from its lucrative foreign markets and authorized General Aniline to export dyestuffs, first, to I. G. agencies in certain British possessions, and, shortly thereafter, to I. G. agencies in Latin America. On September 19, 1939, I. G. cabled General Aniline as follows:

"For Genanilin with reference to article eight of our agreement dated July 31, 1925, in addition to Canada, we release you from export restriction in regard to following countries: Great Britain, British India, Australia, New Zealand, but only for duration of present state of war and as far as supplies to following firms are concerned: I. G. Dyestuffs Limited, 14 Bridge Street, Manchester; 3 Chem. Dyes Ltd, Wittet Road, Ballard Estate, Bombay; Dychem Trading Co., Pty. Ltd., 573 Lonsdale Street, Melbourne; Cone Dyes and Chemicals, Ltd., 15 Courtenay Place, Wellington; C Three. Please confirm."

On September 21, 1939, the following cable was sent from I. G.:

"Our two telegrams of September 19th, replace in first telegram 'for duration of present state of war' by 'until further notice' and act accordingly."

On October 16, 1939, General Aniline Works received a cable from I. G. authorizing it to supply dyestuffs to the I. G. agency in Colombia:

"Referring to your telegram of 29th of last month referring to our telegram of 2nd of this month agree until further notice your supplying dyestuffs to Colombia to our agency only stop Peirsel of our agency will personally call on you in a few days."

On October 28, 1939, ter Meer and Schnitzler, of the I. G., wrote to General Aniline Works confirming these previous cables. The letter states, in part:

"We refer to Art. 8 of our Agreement dated July 31st, 1925, whereby you agreed to confine your manufacture and sale of said products (including i. a. dyestuffs, intermediates and organic auxiliary products but intermediates and auxiliary products only insofar as being products, that are chiefly employed in the manufacture of dyestuffs and colors or for use in dyeing and coloring) to the United States of America, its territories, and Canada.

"In confirmation of our various cables we release you—until further notice—from this export restriction as far as such dyestuffs, intermediates, and organic auxiliary products and the following countries are concerned: Great Britain, British India, Australia, New Zealand, and Colombia, it being understood that your supplies should be restricted to the following firms in these countries (I. G. agencies therein listed)."

Finally, on January 8, 1940, General Aniline received a message from I. G. authorizing it to supply dyestuffs to all Latin-American countries:

"Referring to your telegram of September 29th, our telegram October 2nd agree until further notice your supplying dyestuffs intermediates organic auxiliary products to all Latin-American countries to our agencies only their representatives will call on you probably end of January."

Finally, on January 12, 1940, the same I. G. officials wrote General Aniline, confirming the group of messages sent since the letter of October 28 and listing the I. G. companies in Latin-American countries which General Aniline was authorized to supply:

"We furthermore confirm our cables of December 11th, 1939, and January 6th, 1940, according to which we release you—until further notice—from the export restriction as per acticle 8 of our agreement, dated July 31st, 1935, as far as dyestuffs, intermediates, and organic auxiliary products and the Latin-American countries are concerned, it being understood that your supplies should be restricted to the firms in these countries which are enumerated on the attached list."

These messages exchanged between I. G. and General Aniline from September 19, 1939, to February 12, 1940, when General Aniline was authorized to supply intermediates to Fabrik Rohme in Switzerland, are contained in (exhibit 103).

It was agreed between General Aniline and General Dyestuff that the latter should handle all export business for General Aniline, and letters exchanged between E. K. Halbach, president of General Dyestuffs, and R. Hutz, vice president of General Anline, confirmed this arrangement. The letter of Halbach to Hutz, dated November 1, 1939, stated, in part (exhibit 104):

"Confirming conversation with Dr. Hutz, we agree to handle all export business for the G. A. W. at 20 percent from our contract prices on dyestuffs and intermediates."

Digitized by Google

General Dyestuff considered it inadvisable to handle these exports directly and made arrangements with Fezandie & Sperrle, Inc., a small importer and jobber of dyestuffs in New York City, to handle these transactions for it on a commission of 5 percent off prices quoted to the customer (exhibit 105). At this time one Gerhard Neisser was in the employ of General Dyestuff. Neisser had been employed by I. G. Farben from 1926 to 1938 and had spent almost 10 years in various South American agencies of I. G. Because of his knowledge of the South American market, he was placed in charge of General Dyestuff's export department at this time. When arrangements were made by General Dyestuff with Fezandie, Neisser was placed in charge of Fezandie's newly organized export department. However, until April 1, 1941, Fezandie export offices were located in General Dyestuff's building, and also until this date Neisser's salary was paid by General Dyestuff.

Fezandie & Sperrle exported for General Dyestuff to I. G. agents, or successors thereto, when these agencies were placed on the British blacklist. Certain of Fezandie's connections in South America were established by Alfredo Moll, former submanager of the I. G.'s agency in Buenos Aires, liaison for the I. G. throughout Latin America (exhibits 106 and 107). When many of these companies were blacklisted by the State Department, beginning in July 1941, pursuant to the President's Executive order and proclamation, Fezandie sought new agents to which products were shipped until they in turn were blacklisted. At the present time about 18 consignees of Fezandie have been blacklisted.

By far the largest portion of dyestuffs and dyestuff products exported by Fezandie have been manufactured by General Dyestuff. In all instances, General Dyestuff has sought to match the products formerly supplied by I. G. During the years 1940 and 1941 Fezandie exported approximately $3,000,000 of dyestuffs to Latin-American countries (exhibit 108).

2. *Release of Swiss companies.*—The Swiss representatives in this country also adhered to the terms of the restrictive agreements they had entered into with their parent companies in Basle, by the terms of which they were restrained from selling outside of the United States and Canada. For example, C. W. Mahnken, of Geigy, on August 13, 1937, referred an inquiry of National Development Co. in Manila to the parent company in Basle; thus (exhibit 109):

"We are very grateful for your inquiry of July 16th. Our Franchise does not call for our accepting business outside of the United States and Canada and therefore we are obliged to turn your inquiry over to our Home Office in Basle, Switzerland, Messrs. J. R. Geigy, S. A., from whom you will hear directly or through their representative assigned to that territory.

"We feel quite confident, being the oldest manufacturers of dyestuffs, that we are in an excellent position to attend your needs and above all, to assist you in these first stages.

"Will you please bear with us until Basle is able to get a reply to you."

And when Geigy, Basle, learned from I. G. Farben that Geigy, New York, had approached certain I. G. customers in Cuba in 1937 and had attempted to export large quantities of dyestuffs to that country, it issued a stiff reprimand. In a letter January 18, 1937 (exhibit 110), Moerikofer (in charge of Geigy, Basle's foreign sales) wrote to Walter Saenger, vice president of Geigy, New York.

"We should like to add that naturally we do not want to disturb the Cuban business of our friends (I. G.), the more so since in the crucial period we did no business in Cuba. In case you find that the complaints are well founded, will you please see to it that these disturbances cease." (Original in German.)

And on March 8, 1937 (exhibit 111), the same writer stated:

"* * * We repeat, therefore, that for reasons well known to you, we do not wish to expand our business in Cuba and would ask you to confirm that you have given the necessary instructions." (Original in German.)

Later in this same year, on July 30, 1937, Moerikofer made a similar complaint with reference to Colombia (exhibit 112), where Geigy, New York, had apparently offered certain sulfur black dyes.

"* * * The German I. G. claims that it is doing a substantial business in Sulfur Blacks down there, and asks us therefore to instruct New York not to disturb their business." (Original in German.)

In 1940, however, the Swiss companies in Basle decided to take advantage of the facilities for export possessed by their American subsidiaries. On July 11, 1940, Geigy in Basle informed Geigy in New York of this decision (exhibit 110):

"It has been decided here that in view of the present international circumstances the Cincinnati Chemical Works should for the time being be used as a

Digitized by Google

source of supply for different export markets, for which shipping facilities from Basle do not exist for the moment. Such markets are: Great Britain, British India, Dutch Indies, Latin America, Australasia, China, Japan, South Africa.

"As we know perfectly well that the C. C. W. have no adequate staff for dealing with such purely commercial matters, we have further decided to ask you to take care of such shipments as long as the present circumstances exist.

* * * * * * *

"Considering that we do in no way wish to interfere with the U. S. A. business, there has been decided that the maximum volume of sales to foreign countries should for your firm not exceed $150,000 p. a. In case incoming orders exceed this amount you would first have to approach us before executing them over the above limit.

"We expressively state that there is no limit as to the range of colors which can be shipped. We however reserve to ourselves to give detailed instructions to our representatives. As far as "allocated dyes" are concerned, the idea is that you will be authorized to draw your supplies of such dyestuffs for export from either Ciba or Sandoz at the same prices at which they receive them from the works, whilst you will supply them with such colors on the same price basis. Such invoices will have to be specially marked "for export business" so as to avoid any collision with the American legislation.

"We are at your full disposal to answer any questions you might want to raise in this connection and wish to thank you for the cooperation in this imporant matter, which we are sure you will be glad to lend."

3. *Change in directorate of Cincinnati Chemical Works.*—I have already mentioned the fact that Ciba, Basle, placed its American interests, including Ciba, New York, and its 52 percent interest in Cincinnati Chemical Works in trust, in order to avoid, if possible, seizure by the Alien Property Custodian of Canada (and more recently the United States), should Germany take over Switzerland.

Late in 1940 it was decided in Basle that the directorate of Cincinnati should be Americanized. Until this time only one of the nine directors was a citizen of this country, the other being officials of the parent organizations in Basle.

Accordingly, all but two of the Basle directors resigned, and were replaced by officials of the American representatives and the trustees in common of Ciba's American trusts. George Hardel, president of Cincinnati, continued as director, and Oscar Frey, manager of Cincinnati, was also added.

Exhibits 114 and 115 indicate the negotiations between Cincinnati and its Swiss owners prior to the changes noted.

4. *I. G. Farben takes over Kuhlmann.*—When Hitler's legions marched into France, his economic retinue closely followed the military. A new corporation, Societé Anonyme de Matieres Colorantes et Produits Chimiques Francolor (or merely Francolor), was organized in late 1941. To it Kuhlmann and its associated firms transferred their properties, in return for stock. Then, these companies turned over to I. G. a total of 51 percent of Francolor stock, in proportion to their own holdings, and received, in exchange, shares of I. G. stock. A special statute passed December 10, 1941, authorized the constitution of the new company.

It was provided that a Frenchman should always be president of Francolor, and this was deemed to equalize control. It was also provided that all prior agreements between the I. G. and the French were canceled, not merely suspended, which is the usual consequence of war on cartel agreements of this type.

Exhibit 116 is a clipping from the New York Times, December 22, 1941, announcing the new agreements.

VII. THE DYESTUFF INDUSTRY IN THE UNITED STATES

Our attention has been devoted for some time to the affiliation of the principal American manufacturers with the members of the European cartel, and the manner in which the agreements reached by these parties have influenced and affected commerce in dyestuffs in this country. Participation by General Aniline and the Swiss companies in the American market has been estimated at 40 percent and this has been the case for a number of years. This phase of the discussion will deal with the organization of the domestic market in more detail concerning the manner in which the dominant dyestuff manufacturers have attempted to control it, the means employed, and the results accomplished.

Earlier in the statement attention was directed to the trend toward consolidation of producers within particular countries, and the observation was made that during the period 1919–29 the number of manufacturers in the United States

Digitized by Google

decreased from 90 to 49. American Cyanamid acquired the Calco Chemical Co. in 1929 for $2,542,000, thus entering the dyestuff field. Calco in turn bought out 20 more independent dyestuff companies by 1938. The expenditures for these, plus other chemical company acquisitions not directly in the dyestuff field, amounted to $61,000,000.

By and large, about 90 percent of the dyestuff business transacted in the United States is controlled by General Dyestuff, du Pont, Allied, American Cyanamid, and the Swiss companies.

The colors, shades, and types of dyestuffs manufactured by companies such as du Pont, General Aniline, or Allied, number in the thousands. Consequently, even the largest company does not manufacture a complete line of all colors for all purposes. All intermediates from which final colors are manufactured are likewise not all made by each major color manufacturer. In fact, all dyestuff manufacturers are dependent to some extent upon competitors for intermediate products. Under such conditions it is not surprising to find close working relationships between the handful of companies that do 90 percent of the dyestuff business.

For example, the following situation is typical. Color orange XX may be made from the intermediate beta naphthol which Calcol makes in large quantities. There is a substantial market demand for orange XX and the cost of manufacture decreases rapidly with quantity manufactured. Consequently, if du Pont, General, Ciba, National, etc., all make the product the return to the industry will not be as great as if only one makes it. Since Calco makes beta naphthol from which the orange XX is made, it is the logical manufacturer, and Calco will make all the orange XX and sell it for resale to the other major manufacturers. In turn, other major manufacturers will have their particular products which are sold through the other manufacturers in the same manner. By such arrangements the danger of price cutting and low-profit margins is minimized and everyone is presumed to be better off. Everyone but the outsiders and the consumers. This procedure is so widespread in the dyestuff industry that we find the rather unique situation wherein the largest customer of any one major dyestuff concern is a "competing" company. In the year 1939, for example, du Pont sold dyestuff and intermediate products to General in the amount of $1,449,804, and General sold to du Pont in the amount of $756,024 (exhibit 117).

Inasmuch as each major producer or seller is a customer of each other major producer or seller, the exchange of information concerning prices, products, and other market information for purposes of price stabilization is greatly facilitated. Methods of maintaining uniform prices and products will be explained in the subsequent secton. The sales managers of the several companies are in almost constant touch with each other. A document (exhibit 118) dated October 29, 1935, by Mr. Chandler, of du Pont, to the New York branch, states in part: "We usually talk to General 2 or 3 times every afternoon."

Such close working arrangements not only result in hardship on consumers but it makes the role of a small independent dyestuff manufacturer almost impossible, for the must not only buck the strength of a large competitor but the combined force of 90 percent of the market.

Also, at some stage of manufacture a small producer is going to be dependent upon one of the large competitors for some of the intermediate products from which the final product is made. Control of large-scale operation in the manufacture of a few basic intermediate products can effectively balk the activities of the most efficient small producer. The following situation is a typical example in this industry:

A small manufacturer "A" attempts to make six or seven selected naphthol colors with a relatively small investment. The principal intermediate necessary for their manufacture is a product B. O. N. (beta-oxy-naphthoic acid) for which "A" has one potential source who will sell him in very limited quantities. Not wishing to be restricted and wanting to overcome the constant danger of a price squeeze, the manufacturer decides to attempt the manufacturer of B. O. N. This step is undertaken and the company now has an investment in the manufacture of the intermediate which is several times greater than that required to make the finished dyestuff. But B. O. N. must be made from beta naphthol for which he has two sources from whom he can buy. Now he is up against the same situation as he was before, only worse, because he has a greater investment and more to lose and he cannot possibly go into the manufacture of beta naphthol without expanding far beyond his means.

Contrast this with the following example pertaining to large manufacturers in their arrangements on intermediate products. Du Pont uses about one

Digitized by Google

half of the phthalic anhydride consumed in this country, but produces only a relatively small proportion all for its own use, selling none. On the other hand it procures large supplies from the National Aniline & Chemical Division of Allied Chemical & Dye Corporation, American Cyanamid Co., and Monsanto Chemical Co., at a special price considerably below the market price which other manufacturers have to pay. Since the passage of the Robinson-Patman Act this transaction has been handled under a special bailment arrangement whereby certain facilities of National are set aside for du Pont who furnishes the naphthalene from which the phthalic anhydride is made. The effect of this arrangement is the same as the old special price and National has kept its best customer without having to drop the price.

Another example of the relationships existing between the major firms is the close cooperation on prices. This is indicated in exhibit 119, a letter from Mr. Talbert to Mr. Kerr, both of the National Aniline & Chemical Co. (now a division of Allied), dated June 12, 1938. In part:

"Du Pont have been requested to furnish Calco with prices on the following products. The prices and agreements set down are du Pont's suggestion in regard thereto, on which they await our advice as to whether or not we have any objection to them."

The attitude of major companies toward firms which do not maintain prices is indicated in a letter of July 16, 1937, from Mr. Ludwig, president, to Mr. Talbert, general manager, both of National Aniline & Chemical Co. (exhibit 119–A). In part the letter reads:

"I have read these reports with interest, especially that of Phoenix Color and Chemical Co. Both the leading men are ex-Calco employees, and this may be the answer to Calco's selling them intermediates. It is very difficult to see any sense in this arrangement because Phoenix Color and Chemical Co. have quoted very low prices for acetate silk colors without any necessity of doing so. * * *"

Another letter passing between two small dyestuff firms indicates the restrictions under which they operate. A letter dated November 27, 1940, from Mr. R. W. Cornelison, of the Peerless Color Co., to Industrial Dyestuff Co. referring to possible sales to a large customer at dealer prices states (exhibit 119–B):

"Very naturally I could not do that without getting into trouble both with our dealers and with large manufacturers. They watch us and our prices all the time. We have not been accused of cutting prices but we have been accused of sending out stronger type than they thought we ought to. We have had some controversies on this subject with the two largest dye manufacturers. Doubtless you have had similar experiences."

1. *Price uniformity and stability.*—When comparing prices at which dyestuffs are sold, it is also necessary to relate the strengths of the respective products. The reason for this is that the strengths of particular colors may vary considerably and, therefore, to speak merely of their prices would not be an accurate reflection of their relative values.

The principal manufacturers in dyestuffs have been able to control the price structure of their industry in two ways: By actively fixing prices by agreements among themselves, and by a complete interchange of samples, prices, and relative strengths of products which they offer for sale. This interchange has been facilitated by the intercompany purchasing arrangements previously referred to.

A letter from officials of Geigy, Basle, to Walter Saenger, vice president of Geigy, New York, dated December 7, 1939, refers to price discussions among certain American manufacturers (exhibit 120). Another letter dated April 26, 1933, from Geigy, New York, to Geigy, Basle, refers to a conference with certain competitors concerning prices. A translation of this part of the letter originally written in German states the following (exhibit 121):

"The conference which we have had with our competitors in regard to raising prices has had no result for the time being. One should think that after the lean years the domestic manufacturers should be eager to avail themselves of the opportunity to raise prices. However, there seems to be another reason why at the moment they are not inclined to agree to such a step. They figure that because of the foreign-exchange situation importers will have to ask for higher prices for their products which would create an unfavorable impression upon customers. The domestic manufacturers think that this will be their opportunity to eliminate the competition of imported products. * * *"

The exchange of samples, prices, and relative strengths was complete among these principal manufacturers. Sometimes a sample would be sent from one to another as the result of a direct request; on other occasions a company

Digitized by Google

putting a new product on the market, where introducing a variation of a regular product, would forward sample thereof to other interested producers. Generally the product of one company would be adopted as a so-called "trade standard," i. e., the product to which manufacturers of similar products would attempt to relate their own color. The recipient of a sample would analyze it carefully and subject it to various tests in order to ascertain whether the trade standard had been matched. If a product proved to be overstrength, its manufacturer would be notified with the recommendation that the product be "brought into line." Upon receipt of this criticism the original manufacturer would attempt to follow this friendly advice and correct the strength of his product unless to do so would disrupt the operation of machinery or organization.

Exhibit 122 is a report of a list of tests made on various colors. At the top of each page the standard is listed. In a column down one side of the page are various prototypes of the standard color, and opposite the name of each prototype or similar product is a figure indicating the comparative strength of said prototype in relation to the standard product. These particular charts relate to products offered for sale in Canada, but the same type of interchange takes place in the United States. A letter dated October 26, 1939, from du Pont to Geigy, New York, states that (exhibit 123):

"Strengths of products in Canada are identical with those in the States with the exception of two or three colors, for example: Alizarine Sapphire B N in Canada is only 95%, Alizarine Cyanone Green G Ext. is 90%, Wool Yellow Ex Conc is 95%, Auramine O is 95%, as compared with similar products sold in the United States."

One further letter dated October 3, 1940, relating to the Canadian market, in particular to selling prices quoted to Oxford Woollen Mills, Ltd., states (exhibit 124):

"In future, we shall take up direct with you the question of selling prices so as to avoid a repetition of quoting different prices on the same product."

The manner in which trade standards have been established is clearly indicated by a letter dated November 19, 1940, from Eric J. Monaghan, assistant sales manager, dyestuffs division, organic chemical department, du Pont, to Geigy Co. (exhibit 125):

"Confirming telephone conversation of today, it has been suggested that your Acid Violet 6B Conc. be used as market type for the red shade of Acid Violets and our Pontacyl Violet C4B as standard for the green shade.

"We would suggest that you send 1 lb. samples of your product to du Pont, Calco, Ciba, Sandoz, General, and National. We have contacted Moody and he is agreeable to this set-up. We suggest that you contact the remaining people.

"As competitive types of your product we would suggest that you get samples of—

Calcocid Violet 4BXN	(Calco)
Acid Violet 4BNS Extra Conc.	(Ciba)
Acid Violet 4BNS Conc.	(Sandoz)
Acid Violet S4BA	(General)
Acid Violet S3BA	(General)
Acid Violet 4BN	(National)

"All of these samples have been tested previously in our laboratory and for your information we give you the following reports:

	Du P.	Nat.	Gen.
Pontacyl Violet C4b (Du P.)	100	100	100
Pontacyl Violet S4B (Du P.)	100	100	----------
Pontacyl Violet 4BL (Du P.)	100	105	----------
Calcocid Violet 4BXN (Calco)	80	85	95
Acid Violet 4BNS Ex. Conc. (Ciba)	95	93	102
Acid Violet 4BNS Conc. (Sandoz)	90	93	97
Acid Violet 6B Conc. (Geigy)	100	100	102
Formyl Violet S4BA (Gen.)	83	85	98
Formyl Violet S3BA (Gen.)	80	80	98
Wool Violet 4BN (Nat.)	100	100	105
Wool Violet 5BN (Nat.)	90	100	100

"All of these tests were made by the acid method."

(See note on exhibit regarding comment by receiver of letter.)

Digitized by Google

Interesting enough, there is no indication on the face of this letter that the writer was Mr. Monaghan except for a small slip of paper with the initials E. J. M. thereon, which was clipped thereto. Investigators from the department found other letters identified in a similar manner.

A letter dated September 29, 1938, from "S. C. M." (who is apparently Sidney C. Moody, sales manager of Calco) states (exhibit 126):

"I am sending you separately product samples of Black: (1) Trade Standard, Plutoform Black CA Ex., $.64; (2) Our type, Fast Formyl Black W, $.45.

"The latter is 70% of the former."

This letter indicates that Moody was submitting not only the trade standard but the type manufactured by Calco. The price of the trade standard as indicated was 64 cents per pound, and of the Calco type 45 cents. Moody states that the latter is 70 percent of the former; so is its price, and repeated comparison has proved that price varies directly with strength.

The following excerpts from correspondence indicate the type of communication exchanged after the testing of samples. A letter from Monaghan to C. W. Mahnken, assistant sales manager of Geigy (the author is indicated in the same manner disclosed previously) dated March 8, 1937 (exhibit 127):

"In reference to your letter of February 25th, we have tested the sample which you submitted of Supranol Brown 5RH against the sample which we received from General direct, also against our Du Pont Neutral Brown RS (which we purchase from you) and our new type of Du Pont Neutral Brown 2RS. We consider all four products equal in strength to each other.

"We are sending you under separate cover a sample of our new type of Du Pont Neutral Brown 2RS and would appreciate your comments in this regard."

Another letter from Monaghan to W. F. Zipse, vice president of Geigy (the author of this letter is indicated by reference to particular product as "our") (exhibit 128):

"We recently received from you various samples of Direct Green. You may be interested in our laboratory's report on these samples.

"We find that your Diphenyl Green BB Supra ($.53/.50) is in the ratio of 80:100 vs. our Pontamine Green BX ($.43/.40) and equal to 80 parts Amidine Green M Special ($.53/.50). This brings your product in line with these types.

"Diphenyl Green BY/Supra, however, is in the ratio of 86:100 against Amidine Green M Special. Your selling price is $.53/.50 which makes this type better value than the Campbell product.

"Your Diphenyl Green Bluish Conc. ($.63/.60) is similar to Pontamine Green 2GB Extra. We consider your type in the ratio of 80:100 against our product. Our price is $.42/.40 which makes our product better value.

"Your Direct Green GB/Conc. ($.63/.60) is 84:100 vs. Amidine Green GX and Pontamine Green GX (both $.53/.50) which is approximately money value.

"Your Diphenyl Green C Supra ($1.00) is very much yellower and brighter than Pontamine Green GX or Amidine Green GX and we have compared this against our Pontamine Green 2Y ($.45). We find your product in the ratio of 50:100 vs. ours which would make your product not quite as good money value as our type.

"I would like to discuss these types further with you on my next trip to New York. In the meantime I thought you might want to talk this over with Harry Spatz."

To du Pont's reactions Geigy wrote on June 1, 1938, as follows (exhibit 129):

"I hastily want to make a correction. I originally sent you this sample, which is a works standard, for reasons which you well know but neglected to indicate in my original letter that we sell 90% of this color at $0.53 per lb. bbls. spot, $0.50 per lb. bbls. contract, which places it a few percent out of line with your type. I planned originally to talk to you on the telephone and give you this explanation but neglected to do so, and hasten to make this correction.

"I think you will agree, therefore, that on the strength of present tests and past positive tests in the original set-up that this standard is practically in line—it being a matter of dispute, of course, on strength because of the shade differences.

"*Diphenyl Green Bluish Conc.*—Your report is correct—we are considerably out of line on this product.

"*Direct Green GB Conc.*—We agree with you.

"*Diphenyl Green C Supra.*—We appreciate your report on this.

"This refers to your letter of May 13th."

Digitized by Google

An interesting letter from du Pont to Geigy dated October 4, 1940, is the following:

"We refer to your note of September 30th submitting sample of Diphenyl Fast Blue GLN Conc.

"We have tested this sample and find it equal in strength to the new standard of National's Solantine Blue FF and our Pontamine Fast Blue SFL."

On the face of this letter a representative of Geigy inscribed the following note:

"This correspondence brought about by us finding National 10–15% strong a few months ago—Du Pont found National over but not to the extent we did—National cut their type—Du Pont okayed it—we still found it 5% too good. In tests on first National sample Du Pont had found us 5% thin—U. S. Dyestuff found us 5–7 thin against General, who, it seems, now have the greenness of our type. We confirmed U. S. Dye findings—In view of all the aforementioned it was decided to bring our selling strength to 63 parts color—HCS & A. E. still insist that shade redness is being taken for strength. However, if our greenness can be taken for weakness, we should bring up the strength while we have the opening. * * *"

A very important result of this interchange of information about products in addition to its stabilizing effect on domestic prices has been that it gave I. G. Farben easy access to complete knowledge concerning American production. Because General Aniline (and General Dyestuffs) has been one of the leaders of the industry in this country, it naturally obtained all such information. Product samples of samples received, or at least results of tests conducted by General Aniline, were always forwarded to the I. G., which resulted in putting the latter company on notice concerning the operations of the domestic industry. Similarly, the Swiss members of cartel were constantly informed by their affiliates in this country.

As a result of the cooperative control exercised in the dyestuff industry it has been an especially lucrative field. The dyestuff business is one of the most profitable in this country. Because most of the dyestuff business is not handled by separate companies but rather as a part of more extensive chemical operations with which dyestuffs are so closely associated, figures on rate of return are generally obscured in financial reports. One manufacturing company, however, which is in the dyestuff business only, declared a 100 percent stock dividend and a 20 percent cash dividend in 1935 and in subsequent years did not fall below a dividend of 25 percent. Even these figures do not reflect the full story as they do not include the profits of the selling organizations but only the manufacturing operations.

The high level of prices in the United States is clearly shown by the following excerpt from a letter of instruction to the du Pont office in the Orient (exhibit 131):

"In China, we are giving them two prices—maximum and minimum. The maximum price is the domestic price, plus $0.02 per pound for freight and shipping charges. The minimum price is half-way between the cost and the domestic selling price, but must be at least 30% above cost."

Dyestuff prices are also very stable. Many dyestuff prices have not changed over a 10-year period. A check of the prices of one dyestuff company indicated that on over half of the colors reported the price had not changed in the last 5 years.

Thus we have a dyestuff industry in the United States which has been so closely controlled that prices have been stabilized at higher levels than in many countries in which cartels have had complete legal sanction. Nor has this been primarily due to a high cost of production in the United States as compared to Europe. In the first place labor costs are relatively minor in dyestuff production and furthermore, American producers have continued to sell in many foreign markets at levels substantially below the domestic prices.

Normally such a condition makes a field desirable for newcomers, but this threat has been effectively eliminated by cooperative control of prices and control of production and sale of intermediates and raw materials.

The importance of intermediate production cannot be over-emphasized. In addition to being the key to the general market situation in the dyestuff industry, the manufacture of intermediates is vitally significant in time of war because of the close relationship between dyestuff production and the production of war chemicals and explosives. Each small dyestuff manufacturer who has been eliminated or restricted has thus meant just that much less potential capacity for war production.

EXHIBIT No. 137

SYNTHETIC RUBBER

Statement by Robert M. Hunter

During the First World War, Germany manufactured and used a considerable quantity of synthetic or ersatz rubber. It was made of dimethylbutadiene, was called methyl rubber, and was not particularly good for tires. An understanding of synthetic rubber requires some consideration of the chemistry of this product, and this in turn necessitates some knowledge of the production of hydrocarbon gases. A brief explanation is given in appendixes 1 and 2, exhibit 1.

In the late twenties I. G. Farben in Germany and du Pont in this country were experimenting with new types of synthetic rubber. Du Pont's process was based upon a discovery by Father Nieuwland of Notre Dame that divinylacetylene could be made from acetylene. Carothers of du Pont built upon this discovery and there was evolved the process of making, from acetylene and hydrochloric acid, chloroprene. The chloroprene is polymerized, i. e., small molecules are caused to unite to form large molecules under the proper conditions of temperature and pressure and in the presence of a catalyst.

The synthetic rubber thus produced was first distributed on a commercial scale in 1932 under the name Duprene. It smelled of acetylene and when in 1937 a means was discovered of making it odorless the name was changed to Neoprene. It is relatively high priced, having sold at various prices from $1.05 per pound down to 50 cents per pound. It is used chiefly for specialty purposes in which its oil resistant and other exceptional qualities have made it possible for it to command a price three or four times as great as that of natural rubber (exhibits 2 and 3).

During the same period, from 1925 on, I. G. Farben was developing its buna rubber. Originally in the late twenties and early thirties buna was made by polymerizing butadiene in the presence of sodium (natrium). The word buna was coined from the beginning syllables of these two words. Among the earlier types of buna were those called buna 85 and buna 115, the numerals indicating the molecular weights of 85,000 and 115,000. The butadiene used by I. G. Farben was a gas produced from acetylene, which in turn was a product of coal and lime. Before the middle of the thirties I. G. Farben discovered that the straight butadiene polymer was not as good a synthetic rubber as either of two copolymers which it subsequently developed. One of these was a copolymer of butadiene and styrene in the proportion of 3 to 1 and is called buna S. The other is a copolymer of butadiene and acrylonitrile, in the proportion of 3 to 1, and is called Buna N, or, more recently, perbunan. Buna N is oil resistant and commands a high price as a specialty rubber comparable to Neoprene. Buna S has been widely used in Germany and will be used in this country as a tire material.

I. G. Farben also developed a product which in a variety of forms was marketed under the general name of Oppanol. In this country the name was changed to Vistanex when applied to the material when used outside the oil industry, such as fabric coating, wire insulation, etc. Vistanex in a certain range of molecular weights is similar to rubber and differs from rubber in that it cannot be vulcanized. It is made by polymerizing isobutylene, a refinery gas, and the general name "polybutenes" is sometimes used instead of the trade name Vistanex (exhibit 4).

Standard's butyl rubber is a copolymer of isobutylene and a small quantity of butadiene or some other similar diolefin. The patent application was made in 1937, and, although it is the cheapest and most easily produced of any of the synthetic rubbers, not a pound of it has been produced for commercial use in this country to this date.

There are many other types of synthetic rubber or rubber-like materials, most of which are described in Department of Commerce Circular C 427, published in 1940 (exhibit 5). Butyl rubber is not described in the circular, nor are the following: Goodyear's Chemigum, Goodrich's Ameripol, and Hycar OR.• The latter are the products of a company owned jointly by Goodrich and Phillips Petroleum Co.

SUMMARY OF STANDARD'S INTEREST IN SYNTHETIC RUBBER

Standard Oil Co. of New Jersey has been connected with the synthetic-rubber development in this country from the beginning. In the late twenties it allied itself with I. G. Farben in a series of cartel agreements looking toward monopolistic control in various fields. In 1930 the two companies made an agreement for the joint development of new chemical processes, one of which was to be synthetic rubber.

Abortive negotiations were had with rubber companies in this country in the early thirties. In 1935 I. G. Farben and Standard proposed the formation of a joint company with du Pont in order that buna and duprene might be exploited without competition. The plan did not mature.

After Hitler's 4-year plan went into effect, in 1937, buna was rapidly developed in Germany, and foreign exploitation of it was forbidden. Standard made a deal with I. G. Farben in 1938 to trade Standard's new butyl rubber for I. G. Farben's promise to try to get Hitler to permit exploitation of buna in the United States. From the fall of 1938 to the fall of 1939 the two companies led American rubber companies to believe that the German buna would be made available to them.

After the outbreak of the war, Standard announced that I. G. Farben had completely withdrawn from the buna development in the United States. Standard planned one big company which it would dominate and in which other companies interested in synthetic rubber would have minority interests. As a first step, it prepared and submitted a license agreement to the four major rubber companies which, if accepted by them, would have increased the dominance of Standard in the synthetic rubber program. As a threat to force acceptance of the license it announced its own butyl rubber and held it out as the cheapest and most easily made synthetic rubber. In fact, butyl can be produced for approximately one-third of the present price of natural rubber, although this fact was not disclosed. Standard kept the process a secret in this country from 1937 to June 1940—for more than 2 years after giving it to Germany.

Firestone and United States Rubber accepted the buna license and were allowed to participate in testing butyl. Standard attempted to force Government financing for a large scale buna program intending to reserve its own investment for butyl, which it was sure had greater possibilities. It expected to force recognition of its buna patents through the Government-financed program. Its testing of butyl for tires was of such a character as to shed little light on its real possibilities except to show that a fairly satisfactory tire could be made of this material. This was in 1940.

Goodrich and Goodyear, having their own synthetic rubber developments, refused to accept the Standard license for buna and were not allowed to test butyl. Furthermore, Standard threatened to sue them for patent infringement in connection with buna and actually sued Goodrich.

Pearl Harbor forced the formation of a Government-sponsored pool for making synthetic rubber. Standard withheld its butyl process from the pool and never licensed anyone in the United States to use its butyl patents.

The consent decree of March 25, 1942, forced the free licensing of the buna and butyl patents, with a reasonable charge for the know-how on butyl. Under present plans Standard will make 60,000 tons of butyl rubber out of the total 800,000 tons of synthetic rubber contracted for by the Reconstruction Finance Corporation.

ORDER OF STATEMENT

The statement which follows will take up the various phases of the synthetic rubber story in the following order:

Part 1. Standard, I. G. Farben, and buna.
Part 2. Butyl rubber.
Part 3. A pattern of deception.
Part 4. Suggestions for action.

PART 1. STANDARD ENTERS A PARTNERSHIP WITH I. G. FARBEN

Standard's first contractual relationship with I. G. Farben took place in 1927 when it acquired from the German firm the right to exploit the United States patents covering hydrogenation of oil (exhibit 6). On November 9, 1929, this

Digitized by Google

contract was superseded by a series of agreements in which the two great companies staked out the world as their joint domain (appendix 3, exhibit 7). I. G. Farben was to have the control in the chemical field and Standard in the petroleum field outside Germany. In a letter to E. F. Johnson, Standard attorney, dated July 27, 1936, Frank A. Howard, vice president of Standard and president of Standard Oil Development, summarized the relation between the two companies as follows. I quote only two paragraphs:

"The I. G. may be said to be our general partner in the chemical business as to developments arising during the period beginning in 1929 and expiring in 1947. The desire and intention of both parties is to avoid competing with one another and by these means to permit their technical organizations to cooperate wholeheartedly to their mutual advantage. This arrangement is set forth very clearly in the Division of Fields agreement. It is always dangerous to summarize arrangements which are themselves the briefest possible accurate summary of all the subject matter to which they relate but an understanding of the relationship of the parties involved in this loose general partnership on chemical business is as follows:

"1. The assumption is that the I. G. are going to stay out of the oil business proper and we are going to stay out of the chemical business insofar as that has no bearing on the oil business * * *" (exhibit 8).

One of the other agreements signed on November 9, 1929, by I. G. Farben officials and by Walter C. Teagle, then president of Standard, now chairman of the board, contains this provision:

"In the event the performance of these agreements or of any material provisions thereof by either party should be hereafter restrained or prevented by operation of any existing or future law, or the beneficial interest of either party be alienated to a substantial degree by operation of law or governmental authority, the parties should enter into new negotiations in the spirit of the present agreements and endeavor to adapt their relations to the changed conditions which have so arisen" (appendix 4, exhibit 9).

The consent decree of March 25, 1942 (exhibit 10), forbids continuation of the 1929 agreements, and thus "the performance of these agreements" is now "restrained or prevented by operation of existing law."

THE PARTNERSHIP INCLUDES SYNTHETIC RUBBER

In 1927 synthetic rubber was mentioned as an important problem. The Standard European representative wrote Walter Teagle on November 24, 1927: "* * * one of the members of the shareholders' committee of the I. G. recently stated that the I. G. had developed a process of commercial production of synthetic rubber. I presume that this is one of the problems to which Bosch referred when he said that the liquefaction of coal was only a side issue for the I. G. and that they were working on two or three other problems which were of much greater importance to the Company" (exhibit 11).

Early in 1928 Standard commenced negotiations with I. G. Farben with regard to synthetic rubber. R. T. Haslam, of the Standard board, wrote Frank A. Howard, then an officer and now president of Standard Development, on January 11, 1928:

"Would it be well to have Mr. von Riedemann (Standard European representative) take up with the I. G. the possibility of our being 'in' on the synthetic rubber picture here in America?" (exhibit 12).

That the buna process was intended from the beginning to be exploited in this country by joint action of the two companies is evidenced by the following statement from a letter written by Howard on February 6, 1940:

"The interest of Standard Oil Co. of New Jersey in the buna process dates back to the original agreement of 1929 between I. G. and Jersey. Pursuant to this general agreement, the parties undertook to cooperate in the production of certain new products from oil and gas raw materials in a jointly owned American company which was organized to administer the joint interests of the parties in these fields. The buna synthetic rubber development (to the extent the product was made from oil and natural gas raw materials) was recognized by both parties as coming within the field of this corporation" (exhibit 13).

As will be shown hereafter the buna patents were never acquired by corporations in this country until the summer of 1940, and the know-how for making buna was never given by I. G. Farben at any time.

Standard's desire to cooperate with the German I. G. in a partnership arrangement on synthetic rubber is indicated by its apparent desire to aid the German

Digitized by Google

firm as against du Pont. On April 30, 1930, E. M. Clark, vice president of Standard, wrote Dr. Carl Krauch of I. G. (subsequently a high official in the Nazi government):

"I have just learned in an offhand way that the du Pont interests are doing considerable research work on producing artificial rubber from Butadiene. I am giving you this information, which I believe to be accurate, with the thought that you will wish to carefully review your patent and applications for patents situation" (exhibit 14).

EARLY NEGOTIATIONS BETWEEN RUBBER COMPANIES AND I. G. FARBEN AND STANDARD

In September 1930 Standard and I. G. made the Jasco agreement for joint exploitation of new chemical processes (exhibit 15). Pursuant to this agreement, Jasco, Inc. (Joint Account Study Co.), was organized with each company holding 50 percent of its stock.

In the period beginning in April 1932 and ending in January 1933, Jasco, in behalf of Standard and I. G. Farben, carried on a series of discussions and communications with B. F. Goodrich Rubber Co. The idea underlying the discussions was that Goodrich should take samples of I. G. Farben's buna and experiment with the material endeavoring to ascertain its usefulness in various products. The negotiations terminated with a letter of refusal by R. T. Haslam, vice president of Jasco., to S. B. Robertson, vice president of Goodrich, dated January 20, 1933 (exhibit 16).

On the same date negotiations were opened with General Tire & Rubber Co., (exhibit 17) which eventually resulted in a contract being signed on October 16, 1933, between Jasco and General (exhibit 18). The contract merely provided for General's experimenting with buna samples to be supplied by I. G. Farben and nothing came of it. In a letter dated December 9, 1933, Howard wrote W. O. O'Neil, president of General:

"You will remember the abortive effort which the I. G. Farbenindustrie made in cooperation with your people some years ago to try to do something with the German synthetic rubber" (exhibit 19).

Goodyear began negotiations in 1933 proposing an arrangement for developing synthetic rubber here on the basis of the I. G. Farben's United States patents and Goodyear's experience and interest in rubber (exhibit 20). After consultations with I. G. Farben, Standard turned down the Goodyear offer on February 23, 1934, stating that their existing commitment (with General) was all that should be made (exhibits 21 and 22).

I. G. FARBEN WANTED DUPRENE

In 1932 du Pont had announced its synthetic rubber Duprene (later to be called Neoprene). The buna rubber at that time was of an inferior quality and I. G. Farben was interested in getting the Duprene rights for Germany and in cooperating with du Pont in synthetic rubber generally. In the earlier part of 1934 I. G. Farben held several conferences with du Pont in Germany and in the United States discussing a tie-up on synthetic rubber. Memoranda of these conferences were found in the files of Chemnyco, the New York representative of I. G. Farben (exhibits 23, 24, and 25). A memorandum by Mueller of Chemnyco tells about a conference that took place on May 18, 1934, between Ewing and Wardenburg of du Pont and Krauch and Mueller of I. G. Farben in Oppau, Germany (translation):

"Ewing said that for the time being Duprene was being used only for special purposes * * * and that du Pont was not interested in using it in the manufacture of tires because in that case it would be necessary to reduce considerably the present price of $1.00 per pound" (exhibit 26).

Documents referring to these negotiations were also found in Standard files (exhibits 27, 28, 29, and 30).

On November 12, 1934, I. G. Farben wrote Hochschwender of Chemnyco its New York representative, as follows:

"The situation in the synthetic rubber field has changed considerably as a result of progress that was made in the last few weeks in processing our Butadiene rubber. After the unsuccessful experiments made by Conti and General Tire, all German rubber firms have been supplied with samples of our synthetic rubber for experimental purposes. *This was done at the request of the Reich Rubber Commissar.* After an astonishingly short *time a small firm succeeded in getting favorable results so far as the use of synthetic rubber*

Digitized by Google

for the manufacture of tires is concerned. * * * [Italics supplied in all cases.]

"If current examinations confirm the usability of synthetic rubber, production will be started. This being the situation, it is possible that we are no longer directly interested in reaching an agreement with du Pont in the synthetic rubber field. We would like, therefore, to keep negotiations with du Pont in suspense and await the further development of our examinations. * * *" (exhibit 31).

HITLER FORCES DEVELOPMENT OF BUNA IN GERMANY

The foregoing statement from the Chemnyco files is corroborated by documents in the Standard files, as hereafter shown.

On January 17, 1935, Howard reported to the Standard executive committee as follows:

"Synthetic rubber—Germany. Recent improvements made it commercially practicable and it will be devoloped for immediate use within Germany. Not yet commercially profitable outside Germany on account of competitive price of natural product unless tests now under way show better wearing qualities than natural rubber" (exhibit 32).

On October 9, 1935, Howard wrote Teagle, who was then president of Standard and is now chairman of the board, as follows:

"Dr. Fritz Ter Meer, one of the Directors of the I. G. who is in this country at the present time, called on me last week to discuss the synthetic rubber process which has been in his charge. *The status of this project is that under the instructions of the economic ministry the I. G. have been endeavoring to force its development as rapidly as possible during the last year.* They have at the present time a plant of 25 tons per month capacity. Within one month this capacity will reach 50 tons per month; within one year it will reach 200 tons per month, and beyond this point the instructions of the ministry are to raise the capacity to one thousand tons per month within three years. As regards quality the situation is as follows:

"The product in its natural form is of very superior quality, especially for tire treads, showing an abrasion or wear resistance 50 to 100% better than that of the best natural rubber. Unfortunately, however, this characteristic is associated with a structure which makes it impossible to handle the rubber on the milling and compounding machines used in present rubber factories. As a matter of fact I do not believe that any large-scale process has ever been developed capable of milling and mixing this product satisfactorily. The synthetic product may be mixed with a softening agent and when so mixed can be handled in the regular rubber machinery but its superior qualities are now lost and it becomes only an ordinary grade of rubber. Despite the most determined efforts, no solution of this problem has been found as yet."

(The complete letter is found in appendix, exhibit 33.)

PROPOSED I. G. FARBEN-STANDARD-DU PONT EXPLOITATION OF SYNTHETIC RUBBER IN THIS COUNTRY

In this same letter of October 9, 1935, to Teagle, Howard stated that *"our I. G. friends* have been following closely the development of the du Pont's synthetic rubber product Duprene or Chloroprene." At a later point he stated:

"The gist of the matter therefore is that the I. G. would like to take over du Pont's Duprene development for Germany and push it on a large scale in place of their own process. That makes the prospects for any successful development of the I. G.'s synthetic-rubber process in the United States rather tenuous for the present."

He then suggested the possibility of working out a deal with du Pont on synthetic rubber through the Jasco acetylene arc process.

On November 1, 1935, Howard wrote Ter Meer:

"I return herewith the chart on costs of rubber which you left with me. *I have discussed this situation with Mr. Teagle and find he has no suggestions to make. He is entirely agreeable to our proceeding along the line planned to try to work out an agreement with the du Pont Company*" (Exhibit 34).

On November 8, 1935, Ter Meer answered as follows:

"I wish to thank you for your letter of November 1st. In the meantime we had our discussions at Wilmington about which Dr. Hochschwender has informed you

Digitized by Google

in a brief way. We have succeeded in obtaining from the gentlemen of the du Pont Company an outline of their ideas about a license on their German patent rights for Duprene although the terms of that license are in their present form not acceptable to us and must be subject to further discussion.

"In particular I wish to give you a summary of what we said about the position in this country. *I brought forward the suggestion that a new company in which Standard Oil Company, du Pont and I. G. were to have one-third interest should be formed to take care of butadiene rubber in the United States.* Each party would bring its patents, processes, and "know how" in the butadiene and butadiene-rubber field to that company and the company when operating under the patents and processes in question would pay a fair royalty to the original owners of the patents and processes. *Moreover, some provision should be inserted in the agreement to secure that operation in the butadiene-rubber field should not be carried out on a mere price-fighting basis against Duprene, but rather on a sound economical basis, for instance, manufacture should start only if and when butadiene rubber would prove equal or lower in cost than Duprene* (which is not likely to come) or butadiene rubber would have particular merits in certain fields of application" (exhibit 35).

Nothing came of the proposal for an I. G. Farben-Standard-du Pont synthetic rubber company. However, I. G. Farben's deal with du Pont concerning the exploitation of Duprene in Germany colored the later negotiations with regard to buna development in United States, as will hereafter appear.

FURTHER DEALING WITH AMERICAN COMPANIES DESIRING TO PARTICIPATE IN BUNA DEVELOPMENT

In the letter of October 9, 1935, from Howard to Teagle, to which reference has previously been made (appendix 5, exhibit 33), there is a statement concerning the desire of R. T. Vanderbilt, head of a New York chemical sales organization, to participate in developing buna rubber. It reads as follows:

"As regards direct efforts to do something with the I. G.'s synthetic rubber in the United States, I recently had a call from Mr. R. T. Vanderbilt. He has picked up enough gossip on this synthetic rubber project from various sources to have a pretty good idea of its status. *He is very much interested in the rubber business and urged me to permit him to take over this synthetic rubber development in the United States on almost any basis.* He is very anxious to spend his money trying to do something with it here and is confident that he has the chemical ability in his organization to contribute things which the Germans could not contribute. I mentioned this to Dr. Ter Meer and we agreed that it is not desirable to bring any outside organization directly into this development on a full scale *because this would entail giving them the benefit of a large amount of technical information which even more than the patent situation constitutes the proprietary value of the synthetic rubber project.*

"I urged upon Dr. Ter Meer however further consideration of the possibility of letting Vanderbilt, on his own initiative and own expense, tackle the problem of endeavoring to find either (a) a softener for the present product which would permit of its being worked on present rubber machinery and without losing its exceptional abrasive qualities, or (b) a modification of the rubber machinery which would permit the rubber mills to use the straight synthetic product at reasonable cost. Dr. Ter Meer will further consider this matter and talk to me again about it before he leaves for Germany. I should like to have him meet you gentlemen at this time. He is one of the strongest men in the I. G. executive organization."

Nothing came of Mr. Vanderbilt's proposal.

In 1936 United States Rubber and Goodyear had again become very interested in participating in the buna development. On November 6, 1936, Howard explained that no activity was taking place here but that in Germany rapid progress was being made and added the opinion with respect to their offers to cooperate with I. G. Farben in the development work, "I doubt very much whether anything useful could be accomplished at this time by cooperation between them and an American rubber company but that the only way to determine this was to discuss the matter directly with the I. G." (exhibit 36). Hochschwender of Chemnyco, I. G.'s New York representative, told Howard, "Under existing conditions the answer given by you would seem to me the only possible one to give from our end" (exhibits 37, 38).

Digitized by Google

HITLER FORBIDS EXPLOITATION OF BUNA OUTSIDE GERMANY

The explanation for the absolute inactivity with regard to buna development in this country in the years 1936 and 1937, is to be found in statements in several documents in the Standard files. Howard made notes on February 10, 1937, of a European trip. The following statement is found in the notes:

"Artificial Rubber

"The I. G. are building a very large capacity for the production of their artificial rubber Buna in Germany. This is an integral and important part of the German Four-Year Plan. The attention of other countries has been thus centered on this development and the I. G. are in receipt of requests for licensing this process. JASCO has rights to this process for the world outside of Germany to the extent that the product is made from oil or natural gas. Under the JASCO contract, however, I. G. being the originator of this patented process controls the license power of JASCO with respect thereto and has a 25% overriding royalty. *Under these conditions I. G. have suggested that we permit them to negotiate not only for their own rights but for the JASCO rights as well, that is the rights on oil and natural gas outside of the United States. This request we have agreed to with the understanding that we will be kept advised of any negotiations in which there is any real question of the use of oil or natural gas as a raw material.* Soon after commercial production begins in Germany we expect to obtain limited supplies for sale in the United States as a specialty at a high price, for the purpose of ascertaining what market for the product might exist here at a profitable price level" (exhibit 39).

In a file memorandum of July 23, 1937, M. B. Hopkins, president of Standard Alcohol, states:

"*So far as I know foreign rights to the product outside of Germany and full information regarding the manufacture, use, etc., of the product have not been released to anyone by I. G. probably because the Hitler Government does not look with favor upon turning the invention over to foreign countries,* and also because the I. G. may fear that if any other concern starts working with their product, they may develop methods of processing, milling, improvements, etc., that might cramp I. G. in the promotion of its own invention" (exhibit 40).

On September 8, 1937, Howard, Hopkins, and Asbury of Standard had a conference with ter Meer, Hochschwender, and Ringer of I. G. Farben in Frankfort, Germany. Ter Meer is quoted as follows:

"Large manufacturing in U. S. not economical. Buna N. or Perbunan only product now available. I. G. cannot very well export Buna N. without clearing with du Pont who withdraw Isoprene [Duprene] in late 1935" (exhibit 41).

On October 1, 1937, Hopkins wrote to a Mr. Moss, apparently a Standard foreign representative who was sailing from New York at about the same time Hopkins was returning from Europe. He states:

"Mr. Bedford [of Standard] may be interested in some information I obtained in Germany regarding the synthetic substitute for rubber 'Beuna.' At a meeting with some of the I. G. officials who are responsible for determining the policy in connection with this product Dr. Termeer, who is a Director of the Company, was very emphatic in stating that he did not consider it advisable to place the responsibility for marketing 'Beuna' in the hands of any one company in the United States. He was positive about this and when alternatives were proposed he was very firm. At the present time the manufacture of 'Beuna' in the United States is not considered economical; costs are entirely too high. *The government does not permit export from Germany except by special government permit in every instance.* So far sample quantities are to be shipped to the following in the United States: Goodrich, Raybestos, Vanderbilt, Goodyear, and Manhattan Rubber.

"The I. G. is going ahead on a very large scale with the production of 'Beuna' in Germany but this is possible only because of Government support and Government determination to be independent of foreign rubber supplies. There are a number of different grades of 'Beuna' and the interest to U. S. firms is confined to utilization for special purposes rather than as a general substitute for rubber" (exhibit 42).

The last statement is not in accord with the facts. In a letter from Duisberg of Chemnyco to ter Meer dated March 26, 1937, he discussed a recent conference with Sebrell, of Goodyear, and stated:

"It is interesting to note Sebrell's statement that he felt that the higher price of Buna would be no handicap in the tire field, in view of its superior qualities.

Digitized by Google

He also mentioned that it was desirable and essential for the United States to develop an independent basis for tires" (exhibit 43).

On April 4, 1938, Howard appeared before the Standard executive committee and reported as to the progress of the Buna development in Germany. He said that technical information "*has not been forthcoming as a result of the German Government's refusal, because of military expediency to permit I. G. to reveal such information to anyone outside Germany* * * *" Mr. Howard deplored the fact that the German Government's restrictions on I. G.'s freedom of action had prevented our making material progress in the American field, particularly as there is some indication that the American rubber companies are making independent progress along these lines. As an illustration, he understands Goodyear has already made tentative arrangements with Dow Chemical Company to go ahead in the synthetic rubber field if progress is not made with us. He said he is to have a conference with Goodyear and I. G. representatives here on Wednesday" (appendix 6, exhibit 44).

To briefly summarize, I. G. Farben and Standard had agreed to a joint development of synthetic rubber in this country. They carried on negotiations with various rubber companies in the early thirties with regard to testing the German Buna rubber, which at that time was of an inferior quality. No results came of these negotiations. A plan was proposed for getting du Pont to put its Duprene rubber into a common company with I. G. Farben and Standard and exploit both Duprene and Buna to avoid competition. Nothing came of that plan either. Du Pont continued its manufacture and sale of Duprene, subsequently called neoprene. Hitler forced the development of Buna for tire use in Germany. As a part of his 4-year plan he caused the first large factory to be constructed in 1937 and a second the following year to produce Buna S for tires. He prohibited the exploitation of Buna S or Buna N outside Germany.

STANDARD'S EMPLOYEES DEVELOP BUTYL AND STANDARD MAKES A DEAL WITH GERMANY

Several of Standard's research employees had discovered a process for making synthetic rubber cheaply and easily in the latter part of 1937. The principal raw material, isobutylene, is a cheap, readily available refinery gas. It was apparent at once that, from the standpoint of cost and availability of raw materials and ease of production, it would have a tremendous advantage over Buna or any other known synthetic rubber.

With this knowledge Frank Howard, president of Standard Oil Development, went to Berlin in March 1938 and made a deal with I. G. Farben. This was at the time of the German invasion of Austria (exhibit 45). The deal which Howard made with I. G. Farben was as follows: He agreed to turn over to Germany full information concerning butyl and to furnish samples. In return I. G. Farben agreed that if preliminary tests substantiated Howard's claims as to butyl, I. G. Farben would endeavor to procure Hitler's consent for the exploitation of "rubber-like products" in United States. Standard's files do not contain a written record of the agreement in Berlin, but it is submitted that the above statement is a proper deduction from the following letters.

March 9, 1938, R. P. Russell, vice president of Development, wrote Howard as follows:

"I am attaching Dr. Frolich's letter of March 8th and memorandum by Messrs. Rosen and Thomas of the same date, summarizing the information on isobutylene-butadiene copolymers which has been assembled to date. You appreciate that this memorandum was drawn together hastily and as a result has not been abstracted and summarized as you may wish it, *but certainly it does contain all the essential information.*

"We interpret your cablegram to mean that you wish to present this information to the I. G. so that they may work on it vigorously also. We all of us hope that this can be done without prejudicing Development's position with reference to this particular development. We are all convinced that the development is a really important one and that ultimately it may make considerable money. *We believe it is quite distinct from the I. G. Buna development and is also quite distinct from Vistanex.* We have felt that when the development was presented to Jasco we should be in as good a position with regard to this copolymer as the I. G. is on Buna. In order to make sure that we do obtain such a preferred position, we had hoped that its formal presentation to Jasco could be postponed in order to permit us to make the additional advance in the art that we know will result from further active experimental work. In particular, we all of us are extremely anxious to obtain the higher molecular weight copolymers which, according to the data so far assembled, should have tensile strength and other

Digitized by Google

characteristics fully equal to rubber. The fact that we have not yet reached this status in our own experimental work we hope will not militate against our having a final preferred position in this field.

"Although we have not yet had time to fully analyze the situation, *almost all of us are inclined to favor teaming up with one of the major rubber companies (probably because of technical standing, Goodyear), so that this development may make all possible progress.* The general form of any such cooperative effort we think should be somewhat along the lines of the agreement between Jasco and Procter and Gamble on the fatty acids. In the fatty acid field, for example, we feel that we still would be quite unable to picture the long-term outlet possibilities for the acids if it had not been for our Procter and Gamble cooperative effort. We are not at this time definitely recommending that we do enter an agreement with Goodyear, but since such a general proposal was in our minds *we thought you might wish to discuss the matter with the I. G. at the time you discuss the technical information contained in the attached memorandum* (exhibit 46)."

On March 15, 1938, Howard wrote Russell that while I. G. was making great progress with buna, certain difficulties prevented its exploitation in the United States.

"At my meeting with the I. G. gentlemen in Berlin on the Buna question, it developed that very rapid strides were being made in all phases of the Buna development, and there is even a prospect that this development will very soon stand on its own feet economically in competition with natural rubber under manufacturing conditions and costs in the United States. This is not only in the specialty field of high-priced products, but in the main field of tyre manufacture. Certain difficulties still exist which prevent our I. G. friends from giving us full technical information and proceeding in the normal manner with the commercial development in the United States. It is to be hoped that these difficulties will be surmounted in the near future, and we here desire to do everything possible to bring about that result.

"In view of the very genuine spirit of cooperation which Dr. ter Meer displayed, I am *convinced that it is not only the right thing to do but the best thing from every standpoint to pass on to them full information on the copolymer at this time.* I do not believe we have anything to lose by this which is comparable with the possible benefit to all of our interests" (appendix 7, exhibit 47).

On April 9, 1938, ter Meer of I. G. Farben wrote Howard making the following statements:

"Referring to your letter of March 15th from London, *I wish to thank you very much for your courtesy of sending me the detailed information about the new interpolymers of butadiene and isobutylene made by Standard Development Company. I have forwarded the various reports to our technical gentlemen concerned and they are giving them careful consideration. In accordance with our arrangements in Berlin I have meanwhile taken up negotiations with the competent authorities in order to obtain the necessary freedom of action in U. S. A. with regard to rubber-like products. As anticipated those negotiations have proved to be rather difficult and the respective discussions are expected to take several months before the desired result is obtained.* I will not fail to inform you about the result in due course." (The complete letter is found on appendix 8, exhibit 48.)

It will be noticed that the German restrictions apply to "rubber-like products," meaning butyl as well as buna rubber. What Howard received was a promise from I. G. Farben to "negotiate" with the German Government to obtain "the necessary freedom of action in the United States of America with regard to rubber-like products." Butyl was thus exchanged for a promise to make a plea to the German Government for Buna, a plea that was never granted insofar as permitting a disclosure of the know how of buna was concerned.

STANDARD AND I. G. FARBEN STALL THE RUBBER COMPANIES

The plan in April 1938, after the deal had been made in Berlin the previous month, was to form a large company in which the rubber companies would be allowed to participate with Standard and I. G. Farben in the exploitation of synthetic rubber. The executive committee memoranda for April 4, 1938, contain the following statement:

"As to the method of approaching the rubber industry, Mr. Howard felt less inclined to follow the patent license method than a program of interesting

Digitized by Google

principal U. S. rubber companies with us and I. G. in a manufacturing plant conveniently located near a pipe line, as at Baytown, [Texas] where low cost butane would be readily available" (appendix 6, exhibit 44).

It should be noted that Goodyear had made clear to Standard and I. G. Farben that they could and would proceed independently in the development of synthetic rubber if they were given no participation in the Buna program (exhibit 49). In the Chemnyco files is a cable to Hochschwender of Chemnyco dated March 3, 1938. Translated it reads as follows:

"Refer to your yesterday's cable stop Please cable immediately approximate date of your return to be conveyed as information to Dow and Goodyear stop Feel that we should not tell them what you said in your cable for reason that this if not the same time further explained may create disagreeable disturbance and might induce them to proceed alone or at least make them take an antagonistic attitude.—Duwalt" (exhibit 50).

On April 5, 1938, Howard wrote the Standard executive committee as follows:

"Representatives of the Goodyear Rubber Co. and the Dow Chemical Co. called today to discuss with Jasco their request for an exclusive license under the I. G. processes of producing synthetic rubber. *It had been agreed in advance that we could not accede to this request, but that we should try to hold the good will of these people.* We informed them that, in our opinion, the problem required broader treatment than their proposal would permit" (exhibit 51).

F. H. Bedford, Jr., president of the Atlas Supply Co., the Standard subsidiary engaged in marketing tires and rubber products, wrote to the executive committee on April 8, 1938, to comment on Howard's letter of April 5. He agreed that "*the mutualization of the manufacture of synthetic rubber among the largest rubber companies in the United States would promote the use of this material in the best and quickest manner*" (appendix 9, exhibit 52). He proposed taking in the Big Four and Atlas and suggested that a plan be worked out instead of waiting for Goodyear to propose a plan.

On April 14, 1938, Howard wrote Bedford and stated:

"Concerning your suggestion that we should not await the action of the Goodyear Company, but should be working forward on this matter ourselves, I entirely agree. *The thing that is really holding us up, however, is not the lack of a plan either from Goodyear or ourselves, but the inability of our partners to obtain permission of their government to proceed with the development in the United States.* Until they obtain this permission it is not possible for us to make any commitment at all. Our primary objective in our talk with the Goodyear and Dow people was to convince them of our good faith and our willingness to cooperate with them in order to *avoid having them proceed prematurely with an independent development which would make it impossible to bring them into any general plan later*" (appendix 10, exhibit 53).

In a Chemnyco memorandum of the conference held with Goodyear and Dow in regard to Buna on April 5, 1938, representatives of Goodyear, Dow, Standard, and Chemnyco being present it is stated: "Mr. Howard opened the conference by stating that I. G. and Standard had decided to begin the manufacture of synthetic rubber in the United States" (exhibit 54). Less than a week later and before Howard's letter to Bedford quoted above, Howard wrote James W. Hayes, chairman of the board, Victaulic Co. of America, another rubber manufacturer, on April 11, 1938:

"I acknowledge your letter of March 8th.

"No definite plans have been made as yet for the exploitation of Buna in the United States. The present commercial importations were more or less on an emergency basis to take care of the situation created by the explosion in the du Pont Duprene plant, which prevented them from supplying their customers for some months. When any permanent program for the handling of the Buna development in the United States is taken up, your letter of March 8th will be considered" (exhibit 55).

STANDARD WARNS I. G. FARBEN THAT THE AMERICAN RUBBER COMPANIES CAN'T BE STALLED MUCH LONGER

It will be recalled that Howard had forwarded the butyl information from London to Germany on March 15, 1938, and that ter Meer had acknowledged its receipt on April 9, 1938 (appendix 8, exhibit 48), and promised to start negotiations with the German Government to get permission for some sort of ex-

Digitized by Google

ploitation of "rubber-like products" in the United States of America. To this letter of April 9, Howard sent a reply on April 20, 1938. It reads as follows:

"I acknowledge with thanks your letter of April 9th. *Dr. Hochschwender and myself will do our very best to keep the situation here under control* so that we will have an opportunity of making the most favorable arrangements and of securing for your process the recognition which we all desire for it.

"I wish you early success in your negotiations, and hope especially that, without waiting for final conclusions on all of the questions involved, you may be able to grant us the authority to proceed in a preliminary way with the rather lengthy discussions here which must be had with the various interested rubber companies preparatory to organizing them into a cooperative group.

"*My view is that we cannot safely delay the definite steps looking toward the organization of our business in the United States, with the cooperation of the people here who would be the strongest allies, beyond next fall—and even to obtain this much delay may not be too easy*" (appendix 11, exhibit 56).

On the same day, April 20, 1938, he wrote Bedford as follows:

"I am just in recipt of a letter from Dr. ter Meer, the essential part of which is as follows:

" 'In accordance with our arrangements in Berlin I have meanwhile taken up negotiations with the competent authorities in order to obtain the necessary freedom of action in the U. S. A. with regard to rubber-like products. As anticipated those negotiations have proved to be rather difficult and the respective discussions are expected to take several months before the desired result is obtained. I will not fail to inform you about the result in due course.' "

"To this I have sent the attached reply:

" 'Dr. Hochschwender fully agrees with the ideas I have expressed and I shall continue, through him, to press for permisison to have some informal talks with some of the other rubber people at the earliest moment. *Until we have this permission, however, there is absolutely nothing we can do and we must be especially careful not to make any move whatever, even on a purely informal, personal, or friendly basis, without the consent of our friends.* We know some of the difficulties they have, both from business complications and interrelations with the rubber and chemical trades in the United States, and *from a national standpoint* in Germany, but we do not know the whole situation—and since under the agreement they have full control over the exploitation of this process, the only thing we can do is to continue to press for authority to act, but in the *meantime loyally preserve the restrictions they have put on us*' " (appendix 12, exhibit 57).

On May 3, 1938, Orville Harden and F. H. Bedford, Standard directors, conferred with D. A. Schmitz and W. P. Pickhardt, of Chemnyco, and urged that every effort be put forth to hasten plans for the buna development.

"Particular emphasis was given because of the close tie-ups between Standard Oil Co. of New Jersey and U. S. Rubber, Atlas Tire, Standard Oil Co. of California, Indiana, Ohio, and Kentucky" (exhibit 58).

This cryptic language is found in a cable from the Chemnyco officials to W. H. Duisberg of I. G. Farben at Frankfort reporting the conference. On the next day May 4, 1938, ter Meer cabled Chemnyco:

"Everything must be avoided which may interfere with the current negotiations we are carrying on with the government agencies. There must be absolutely no publicity in regard to the steps we want to take in U. S. A. before our government has given its permission" (exhibit 59).

ESPIONAGE BY CHEMNYCO

A letter from Chemnyco to ter Meer dated June 3, 1938, makes reference to another conference held between Chemnyco and Dow and Goodyear.

"An exclusive license had been previously denied. When Sebrell (Goodyear) asked for a nonexclusive license, he was given to understand that there could be no question of such a nonexclusive license either at this moment. The reason we gave him was that it was not shown that Dow and Goodyear had anything new and important to contribute. * * *

"We thought it expedient to conduct the negotiations in such a way that we would continue to observe and become acquainted with Dow's and Goodyear's experiments" (exhibit 60).

STANDARD AND I. G. FARBEN PUT ON AN ACT FOR THE RUBBER COMPANIES

The executive committee memorandum for October 31, 1938, contains the following statements:

"*Synthetic rubber.*—Negotiations indicate that the German Government will now permit discussions of details with, and revelation of technical processes to non-German parties in interest, so that within one or two months considerable progress ought to be made in these negotiations; *although the German interests hope to sell the process to the international rubber cartel that cource would probably mean the process might be buried in the interest of maintaining a market for natural rubber.* From our approach, the possibility of interesting some rubber interest in the United States in a mutualized company for the commercialization of the process would seem the more normal course. Although the base stock used in this synthetic process is normally refinery gas, there is a possibility of a less prolific supply by dehydrogenating the butane in natural gas. To the extent that the patent question has been searched to date, the situation seems clear of any major difficulty.

"Buna N which is the high quality, high-priced specialty rubber produced from this synthetic process, appears to have a ready market and Goodyear has already approached our interests for a license as soon as licenses are available.

"Buna S the lower priced quantity product from the process, which would be used in the rubber tire market, is more difficult to produce at a commercially practicable cost, although recent developments in Germany indicate it may be possible to produce this product at a cost of between 15¢ and 20¢ per pound, as compared with the market for crude rubber which has varied in the past several years between 10¢ and 30¢ per pound" (appendix 13, exhibit 61).

The following letter is from Howard to Farish dated November 18, 1938:

"Dr. ter Meer, of the I. G. Farbenindustrie, will arrive in New York on Thanksgiving Day and will be accompanied by Dr. Muller-Cunradi. Dr. ter Meer must sail from here the 16th of December.

"During their stay they wish to review the entire situation in connection with the establishment of a synthetic rubber industry in the United States, which will involve (1) a study of the available hydrocarbon gases and a comparison of data on processing costs, which will be made by Dr. Muller-Cunradi jointly with our technical people, and (2) a review of the economic and financial aspects of the project. In this last connection, Dr. ter Meer believes it will be desirable to consult with the heads of all the principal rubber companies.

"*The question which should be settled at the outset is whether, in the discussions with outside interests in the United States, it is desirable that Dr. ter Meer should present the matter as an I. G. project, identifying Jersey only as a probable cooperator and supplier of raw materials, or whether it is in the interests of both parties that the matter should be presented from the outset as a project which, if undertaken in America, will be a primarily American project, sponsored by Jersey, but of course based upon the German I. G. technical foundation.*

"Not being able to see clearly just how the matter would proceed practically in the United States, or what would be in the interests of the parties, we have, in the few discussions with outsiders which have been held to date in the United States, *straddled the above issue*, but it would appear that we shall have to give a little more definite indication of our position in the matter if we are to make very much headway during Dr. ter Meer's present visit.

"*My present opinion is that it is probably desirable, without making any definite statements on the subject, to conduct the discussions in the United States in all cases jointly with Dr. ter Meer and under such conditions as to give the definite impression that Jersey is taking a leading part in developing the situation here.*"

The complete letter is found in appendix 14, exhibit 62.

The following statements are taken from Standard Executive Committee memoranda November 28, 1938:

"Mr. F. A. Howard and Drs. Hochschwender and ter Meer of the German I. G. joined the meeting. Dr. ter Meer first reviewed the progress made by the I. G. in expermenting with synthetic rubber * * *. By 1934 the program of self-sufficiency initiated by the new national regime in Germany, together with encouraging progress in experimentation in the synthetic rubber field, resulted

Digitized by Google

characteristics fully equal to rubber. The fact that we have not yet reached this status in our own experimental work we hope will not militate against our having a final preferred position in this field.

"Although we have not yet had time to fully analyze the situation, *almost all of us are inclined to favor teaming up with one of the major rubber companies (probably because of technical standing, Goodyear), so that this development may make all possible progress.* The general form of any such cooperative effort we think should be somewhat along the lines of the agreement between Jasco and Procter and Gamble on the fatty acids. In the fatty acid field, for example, we feel that we still would be quite unable to picture the long-term outlet possibilities for the acids if it had not been for our Procter and Gamble cooperative effort. We are not at this time definitely recommending that we do enter an agreement with Goodyear, but since such a general proposal was in our minds *we thought you might wish to discuss the matter with the I. G. at the time you discuss the technical information contained in the attached memorandum* (exhibit 46)."

On March 15, 1938, Howard wrote Russell that while I. G. was making great progress with buna, certain difficulties prevented its exploitation in the United States.

"At my meeting with the I. G. gentlemen in Berlin on the Buna question, it developed that very rapid strides were being made in all phases of the Buna development, and there is even a prospect that this development will very soon stand on its own feet economically in competition with natural rubber under manufacturing conditions and costs in the United States. This is not only in the specialty field of high-priced products, but in the main field of tyre manufacture. Certain difficulties still exist which prevent our I. G. friends from giving us full technical information and proceeding in the normal manner with the commercial development in the United States. It is to be hoped that these difficulties will be surmounted in the near future, and we here desire to do everything possible to bring about that result.

"In view of the very genuine spirit of cooperation which Dr. ter Meer displayed, I am *convinced that it is not only the right thing to do but the best thing from every standpoint to pass on to them full information on the copolymer at this time.* I do not believe we have anything to lose by this which is comparable with the possible benefit to all of our interests" (appendix 7, exhibit 47).

On April 9, 1938, ter Meer of I. G. Farben wrote Howard making the following statements:

"Referring to your letter of March 15th from London, *I wish to thank you very much for your courtesy of sending me the detailed information about the new interpolymers of butadiene and isobutylene made by Standard Development Company. I have forwarded the various reports to our technical gentlemen concerned and they are giving them careful consideration. In accordance with our arrangements in Berlin I have meanwhile taken up negotiations with the competent authorities in order to obtain the necessary freedom of action in U. S. A. with regard to rubber-like products. As anticipated those negotiations have proved to be rather difficult and the respective discussions are expected to take several months before the desired result is obtained.* I will not fail to inform you about the result in due course." (The complete letter is found on appendix 8, exhibit 48.)

It will be noticed that the German restrictions apply to "rubber-like products," meaning butyl as well as buna rubber. What Howard received was a promise from I. G. Farben to "negotiate" with the German Government to obtain "the necessary freedom of action in the United States of America with regard to rubber-like products." Butyl was thus exchanged for a promise to make a plea to the German Government for Buna, a plea that was never granted insofar as permitting a disclosure of the know how of buna was concerned.

STANDARD AND I. G. FARBEN STALL THE RUBBER COMPANIES

The plan in April 1938, after the deal had been made in Berlin the previous month, was to form a large company in which the rubber companies would be allowed to participate with Standard and I. G. Farben in the exploitation of synthetic rubber. The executive committee memoranda for April 4, 1938, contain the following statement:

"As to the method of approaching the rubber industry, Mr. Howard felt less inclined to follow the patent license method than a program of interesting

Digitized by Google

principal U. S. rubber companies with us and I. G. in a manufacturing plant conveniently located near a pipe line, as at Baytown, [Texas] where low cost butane would be readily available" (appendix 6, exhibit 44).

It should be noted that Goodyear had made clear to Standard and I. G. Farben that they could and would proceed independently in the development of synthetic rubber if they were given no participation in the Buna program (exhibit 49). In the Chemnyco files is a cable to Hochschwender of Chemnyco dated March 3, 1938. Translated it reads as follows:

"Refer to your yesterday's cable stop Please cable immediately approximate date of your return to be conveyed as information to Dow and Goodyear stop Feel that we should not tell them what you said in your cable for reason that this if not the same time further explained may create disagreeable disturbance and might induce them to proceed alone or at least make them take an antagonistic attitude.—Duwalt" (exhibit 50).

On April 5, 1938, Howard wrote the Standard executive committee as follows:

"Representatives of the Goodyear Rubber Co. and the Dow Chemical Co. called today to discuss with Jasco their request for an exclusive license under the I. G. processes of producing synthetic rubber. *It had been agreed in advance that we could not accede to this request, but that we should try to hold the good will of these people.* We informed them that, in our opinion, the problem required broader treatment than their proposal would permit" (exhibit 51).

F. H. Bedford, Jr., president of the Atlas Supply Co., the Standard subsidiary engaged in marketing tires and rubber products, wrote to the executive committee on April 8, 1938, to comment on Howard's letter of April 5. He agreed that "*the mutualization of the manufacture of synthetic rubber among the largest rubber companies in the United States would promote the use of this material in the best and quickest manner*" (appendix 9, exhibit 52). He proposed taking in the Big Four and Atlas and suggested that a plan be worked out instead of waiting for Goodyear to propose a plan.

On April 14, 1938, Howard wrote Bedford and stated:

"Concerning your suggestion that we should not await the action of the Goodyear Company, but should be working forward on this matter ourselves, I entirely agree. *The thing that is really holding us up, however, is not the lack of a plan either from Goodyear or ourselves, but the inability of our partners to obtain permission of their government to proceed with the development in the United States.* Until they obtain this permission it is not possible for us to make any commitment at all. Our primary objective in our talk with the Goodyear and Dow people was to convince them of our good faith and our willingness to cooperate with them in order to *avoid having them proceed prematurely with an independent development which would make it impossible to bring them into any general plan later*" (appendix 10, exhibit 53).

In a Chemnyco memorandum of the conference held with Goodyear and Dow in regard to Buna on April 5, 1938, representatives of Goodyear, Dow, Standard, and Chemnyco being present it is stated: "Mr. Howard opened the conference by stating that I. G. and Standard had decided to begin the manufacture of synthetic rubber in the United States" (exhibit 54). Less than a week later and before Howard's letter to Bedford quoted above, Howard wrote James W. Hayes, chairman of the board, Victaulic Co. of America, another rubber manufacturer, on April 11, 1938:

"I acknowledge your letter of March 8th.

"No definite plans have been made as yet for the exploitation of Buna in the United States. The present commercial importations were more or less on an emergency basis to take care of the situation created by the explosion in the du Pont Duprene plant, which prevented them from supplying their customers for some months. When any permanent program for the handling of the Buna development in the United States is taken up, your letter of March 8th will be considered" (exhibit 55).

STANDARD WARNS I. G. FARBEN THAT THE AMERICAN RUBBER COMPANIES CAN'T BE STALLED MUCH LONGER

It will be recalled that Howard had forwarded the butyl information from London to Germany on March 15, 1938, and that ter Meer had acknowledged its receipt on April 9, 1938 (appendix 8, exhibit 48), and promised to start negotiations with the German Government to get permission for some sort of ex-

ploitation of "rubber-like products" in the United States of America. To this letter of April 9, Howard sent a reply on April 20, 1938. It reads as follows:

"I acknowledge with thanks your letter of April 9th. *Dr. Hochschwender and myself will do our very best to keep the situation here under control* so that we will have an opportunity of making the most favorable arrangements and of securing for your process the recognition which we all desire for it.

"I wish you early success in your negotiations, and hope especially that, without waiting for final conclusions on all of the questions involved, you may be able to grant us the authority to proceed in a preliminary way with the rather lengthy discussions here which must be had with the various interested rubber companies preparatory to organizing them into a cooperative group.

"*My view is that we cannot safely delay the definite steps looking toward the organization of our business in the United States, with the cooperation of the people here who would be the strongest allies, beyond next fall—and even to obtain this much delay may not be too easy*" (appendix 11, exhibit 56).

On the same day, April 20, 1938, he wrote Bedford as follows:

"I am just in recipt of a letter from Dr. ter Meer, the essential part of which is as follows:

" 'In accordance with our arrangements in Berlin I have meanwhile taken up negotiations with the competent authorities in order to obtain the necessary freedom of action in the U. S. A. with regard to rubber-like products. As anticipated those negotiations have proved to be rather difficult and the respective discussions are expected to take several months before the desired result is obtained. I will not fail to inform you about the result in due course.' "

"To this I have sent the attached reply:

" 'Dr. Hochschwender fully agrees with the ideas I have expressed and I shall continue, through him, to press for permisison to have some informal talks with some of the other rubber people at the earliest moment. *Until we have this permission, however, there is absolutely nothing we can do and we must be especially careful not to make any move whatever, even on a purely informal, personal, or friendly basis, without the consent of our friends.* We know some of the difficulties they have, both from business complications and interrelations with the rubber and chemical trades in the United States, and *from a national standpoint* in Germany, but we do not know the whole situation—and since under the agreement they have full control over the exploitation of this process, the only thing we can do is to continue to press for authority to act, but in the *meantime loyally preserve the restrictions they have put on us*' " (appendix 12, exhibit 57).

On May 3, 1938, Orville Harden and F. H. Bedford, Standard directors, conferred with D. A. Schmitz and W. P. Pickhardt, of Chemnyco, and urged that every effort be put forth to hasten plans for the buna development.

"Particular emphasis was given because of the close tie-ups between Standard Oil Co. of New Jersey and U. S. Rubber, Atlas Tire, Standard Oil Co. of California, Indiana, Ohio, and Kentucky" (exhibit 58).

This cryptic language is found in a cable from the Chemnyco officials to W. H. Duisberg of I. G. Farben at Frankfort reporting the conference. On the next day May 4, 1938, ter Meer cabled Chemnyco:

"Everything must be avoided which may interfere with the current negotiations we are carrying on with the government agencies. There must be absolutely no publicity in regard to the steps we want to take in U. S. A. before our government has given its permission" (exhibit 59).

ESPIONAGE BY CHEMNYCO

A letter from Chemnyco to ter Meer dated June 3, 1938, makes reference to another conference held between Chemnyco and Dow and Goodyear.

"An exclusive license had been previously denied. When Sebrell (Goodyear) asked for a nonexclusive license, he was given to understand that there could be no question of such a nonexclusive license either at this moment. The reason we gave him was that it was not shown that Dow and Goodyear had anything new and important to contribute. * * *

"We thought it expedient to conduct the negotiations in such a way that we would continue to observe and become acquainted with Dow's and Goodyear's experiments" (exhibit 60).

STANDARD AND I. G. FARBEN PUT ON AN ACT FOR THE RUBBER COMPANIES

The executive committee memorandum for October 31, 1938, contains the following statements:

"*Synthetic rubber.*—Negotiations indicate that the German Government will now permit discussions of details with, and revelation of technical processes to non-German parties in interest, so that within one or two months considerable progress ought to be made in these negotiations; *although the German interests hope to sell the process to the international rubber cartel that cource would probably mean the process might be buried in the interest of maintaining a market for natural rubber.* From our approach, the possibility of interesting some rubber interest in the United States in a mutualized company for the commercialization of the process would seem the more normal course. Although the base stock used in this synthetic process is normally refinery gas, there is a possibility of a less prolific supply by dehydrogenating the butane in natural gas. To the extent that the patent question has been searched to date, the situation seems clear of any major difficulty.

"Buna N which is the high quality, high-priced specialty rubber produced from this synthetic process, appears to have a ready market and Goodyear has already approached our interests for a license as soon as licenses are available.

"Buna S the lower priced quantity product from the process, which would be used in the rubber tire market, is more difficult to produce at a commercially practicable cost, although recent developments in Germany indicate it may be possible to produce this product at a cost of between 15¢ and 20¢ per pound, as compared with the market for crude rubber which has varied in the past several years between 10¢ and 30¢ per pound" (appendix 13, exhibit 61).

The following letter is from Howard to Farish dated November 18, 1938:

"Dr. ter Meer, of the I. G. Farbenindustrie, will arrive in New York on Thanksgiving Day and will be accompanied by Dr. Muller-Cunradi. Dr. ter Meer must sail from here the 16th of December.

"During their stay they wish to review the entire situation in connection with the establishment of a synthetic rubber industry in the United States, which will involve (1) a study of the available hydrocarbon gases and a comparison of data on processing costs, which will be made by Dr. Muller-Cunradi jointly with our technical people, and (2) a review of the economic and financial aspects of the project. In this last connection, Dr. ter Meer believes it will be desirable to consult with the heads of all the principal rubber companies.

"*The question which should be settled at the outset is whether, in the discussions with outside interests in the United States, it is desirable that Dr. ter Meer should present the matter as an I. G. project, identifying Jersey only as a probable cooperator and supplier of raw materials, or whether it is in the interests of both parties that the matter should be presented from the outset as a project which, if undertaken in America, will be a primarily American project, sponsored by Jersey, but of course based upon the German I. G. technical foundation.*

"Not being able to see clearly just how the matter would proceed practically in the United States, or what would be in the interests of the parties, we have, in the few discussions with outsiders which have been held to date in the United States, *straddled the above issue*, but it would appear that we shall have to give a little more definite indication of our position in the matter if we are to make very much headway during Dr. ter Meer's present visit.

"*My present opinion is that it is probably desirable, without making any definite statements on the subject, to conduct the discussions in the United States in all cases jointly with Dr. ter Meer and under such conditions as to give the definite impression that Jersey is taking a leading part in developing the situation here.*"

The complete letter is found in appendix 14, exhibit 62.

The following statements are taken from Standard Executive Committee memoranda November 28, 1938:

"Mr. F. A. Howard and Drs. Hochschwender and ter Meer of the German I. G. joined the meeting. Dr. ter Meer first reviewed the progress made by the I. G. in expermenting with synthetic rubber * * *. By 1934 the program of self-sufficiency initiated by the new national regime in Germany, together with encouraging progress in experimentation in the synthetic rubber field, resulted

Digitized by Google

in a plan to construct a 24,000/30,000-ton commercial scale plant to be completed by 1936. Such plant was in full operation in the latter part of 1937 and 1938 and a second factory of similar size will be started in May of 1939 to be completed in 1940.

"Of total German rubber consumption of between 95,000 and 100,000 tons per annum, the first syntheic rubber factory is producing about one-fourth of those requirements and by 1941, with two plants operating at capacity, it is estimated that 70% of German consumption will be taken care of * * *.

*"The German Government now having permitted the I. G. to make complete disclosure outside Germany of the "know-how" on the process [never done] and to attempt commercial exploitation, particularly in the United States, the first question for the Committee to consider is whether they would suggest he contact the four leading American tire companies in I. G.'s behalf or on behalf of Jersey as sponsor for the process in the United States. The Committee felt that he should contact the tire companies on Jersey's behalf as sponsor for the process, it being intimated to the tire companies that negotiations between I. G. and the Jersey Company have not yet been crystallized, but that they are in process of development * * *"* (*appendix 15, exhibit 63*).

Buna Cost Comparable to Natural Rubber, Butyl Much Cheaper

The following is an extract from the Standard Executive Committee Memoranda, November 29, 1938:

"The 18½¢ per pound cost of making Buna S," referred to by Dr. ter Meer yesterday, is predicated on such supplies of butane as are referred to above at a cost of around 1.8¢ per gallon f. o. b. Baytown, which the Development people feel is a fair cost to place on this material. If, however, the Executive Committee will consider favorably within the next few months the Sales Department's recommendation that facilities be provided for making a 'heavy ESSO' of superior octane and other road characteristics through the high-temperature low-pressure crack of gas oil, it should be borne in mind that such a process would produce a considerable amount of butadiene and other chemicals, as by-products, at so reasonable a cost that if the raw material from Buna 'S' were derived therefrom *its production cost would be reduced from 18½¢ figure referred to by Dr. ter Meer to around 13¢ or 13½¢.*

"Mr. Murphree then explained the Development Company's own copolymer process for the production of synthetic rubber. Present estimates indicate that a fifty-ton per day plant for the production of synthetic rubber from this process would cost about $3,000,000 and produce the synthetic rubber at a manufacturing cost of *around 12¢ as compared with the 18½¢ cost of the Buna 'S' method*" (Appendix 16, exhibit 64).

Ter Meer made his tour of the rubber companies conferring with United States Rubber on December 7, 1938; Firestone, December 9; Goodyear, December 12; Goodrich, December 14; and General, December 15 (exhibit 65). To keep the rubber companies interested, the next step was taken in the spring of 1939, when a representative from the I. G. Farben rubber works made another tour of the rubber companies. Samples of Buna S made in Germany were distributed among the five rubber companies, Standard and du Pont. Arrangements were made for tire tests on the part of the rubber companies, and results were expected by August of 1939. This is discussed in a memorandum of H. Beller of Chemnyco, dated May 4, 1939 (exhibit 66). Apparently the tire tests were not completed prior to September 1, 1939; at any rate no action had been taken by I. G. Farben and Standard in connection with tests made by these rubber companies.

Germany Goes to War, Rubber Companies Demand Action and Howard Goes to Holland

The war commenced on September 1, 1939. On September 15, 1939, Sebrell, of Goodyear, had a conference with Hochschwender of Chemnyco, in New York.

"Sebrell expressed the opinion that, in view of the present situation, [the war] developments in the synthetic rubber field were progressing very rapidly and that *further stalling* on the part of I. G. might prove detrimental to I. G.'s interests" (appendix 17, exhibit 67).

On September 19, 1939, Semon of Goodrich, had a conference with Chemnyco. In the course of this conference, Semon stated that Goodrich was determined not to give up the market which they had created for Perbunan. If, in view of

Digitized by Google

the new situation [apparently reference to the outbreak of the war] Perbunan would be no longer available in United States of America, he stated that Goodrich would be compelled to take the initiative and produce Perbunan or equal products itself" (appendix 18, exhibit 68).

On September 25, Howard met I. G. Farben officials in The Hague and entered into an agreement known as The Hague Memorandum (appendix 19, exhibit 69). The purpose of this agreement was to rearrange the ostensible ownership of I. G. Farben in the processes exploited by Jasco. To avoid seizure by the Alien Property Custodians of the German interests it was provided that I. G. Farben's 50 percent stock interest should be assigned to Development. As Howard wrote to Minton on October 16, 1939:

"The substance of the main proposal for readjustment of the Jasco arrangement is that in place of having the I. G. and Jersey jointly interested in these processes throughout the world outside of Germany, Jasco become 100% Jersey and takes over 100% interest in the processes for the U. S. and the French and Briitsh empires, while the I. G. takes over 100% interest in the same processes for the rest of the world. I believe this arrangement, when coupled with the provision for future readjustments, is entirely equitable, and that without regard to the possibility of legally enforcing the readjustment provision, it should be satisfactory in substance to us, as it is to the I. G. An attempt to put this provision in a form which would be fully legally enforceable might result in many difficulties, and (speaking for myself and the I. G. negotiators) it was not our intention to provide for any legally enforceable clause of this character in our arrangements.

* * * * * * *

"In addition to the above direct guarantees for the return of the pounds advanced, the arrangement seems to be the only safe and certain method of putting into operation the settlement of the Jasco affairs and being as certain as possible that this rearrangement will leave us in full control of the situation *without interference of any government as regards the processes in question for the U. S., the British Empire, and the French empire*" (appendix 20, exhibit 70).

Thus, Standard was given apparent full control over the three Jasco processes and the buna process (which was then for the first time recognized as being in Jasco) in the United States and the British and French Empires. As Russell wrote in a memorandum for Farish on May 9, 1940:

"Although general cooperation between Jersey and I. G. in regard to Buna had gone on for several years, it was decided not to bring the Buna process officially into Jasco and contractual settlement of the matter was postponed for political reasons. The official bringing of the Buna rights into Jasco resulted from the so-called Hague Memorandum, which was finally made effective as of September 1, 1939" (appendix 21, exhibit 71).

I. G. Farben was given full control for the rest of the world. It was further provided that if this redistribution of royalty rights from Jasco processes should prove to be inequitable in comparison with the original basis for distribution, any inequities would be corrected at a later time. This is found in section IV of the Hague memorandum:

* * * * * * *

"On request of either party (S. O. Dev. Co. or I. G.) made at any time after one year, and not more frequently than once each year thereafter, from the date hereof, the parties shall exchange reports of their respective returns from the promotion of the said processes, and if it shall appear from such reports that the division of territory of exclusive ownership between the parties as herein effected have not been equitable in its financial results as judged by the agreement of September 30, 1930, then the parties shall correct the inequity in such manner as may seem most fair and advantageous at the time" (appendix 19, exhibit 69)[1].

* * * * * * *

To protect I. G.'s continuing interest, its 50 percent stock interest was assigned to Trustees instead of to Development (appendix 22, exhibit 72).

In a letter of October 12, 1939, Howard wrote:

"Pursuant to these arrangements I was able to keep my appointments in Holland, where I had three days of discussion with the representatives of the I. G. They delivered to me assignments of some 2,000 foreign patents, and we did our best to work out complete plans for a *modus vivendi* which would operate through the term of the war, whether or not the United States came in" (appendix 23, exhibit 73).

THE MUNITIONS BOARD, STANDARD, AND THE RUBBER COMPANIES

Standard's further dealings with the rubber companies can be better understood if one has a grasp of Standard's relations with the Army and Navy Munitions Board. As revealed in the Standard documents, this Board was charged with the duty of making adequate preparation for just such an exigency as has arisen, i. e., the total loss of our natural-rubber supply. In January 1939 Standard representatives met with the Munitions Board and discussed the synthetic-rubber situation (appendix 24, exhibit 74). Small samples of Buna S, Buna N, and butyl rubber were given to be tested for use by the Chemical Warfare Service and by the Navy (appendix 25, exhibit 75).

On October 19, 1939, Howard Hopkins, and Frolich, director of the chemical division of Esso Laboratories, met with the Munitions Board at the latter's request (appendix 26, exhibit 76). In a letter to A. C. Minton, Standard secretary, dated October 25, 1939, Howard states that the Munitions Board was concerned about the natural rubber supply.

"In view of this situation the Munitions Board desires to know as accurately as possible what the situation is with regard to the possibility of producing rubber synthetically within the United States" (appendix 27, exhibit 77).

The Standard representatives undertook to coordinate the results of the tests of Buna S and to get a rough estimate of capital and operating costs for a 25,000-ton Buna S plant.

On October 31, 1939, Standard procured from I. G. Farben's New York representative (H. Beller of Chemnyco) a nine-page "memorandum re manufacture of Buna S and Perbunan in United States of America." The first page contains the following statement:

"(*A*) *Licensing and Manufacturing Arrangements*

"During the last two years I. G. have been approached repeatedly by several American companies concerning manufacturing arrangements or the granting of a license for the manufacture, use, and sale in the United States of products of the Buna type, especially Perbunan. Two of these inquiries have been made by well-known rubber companies, which have had already long and detailed experience with Perbunan.

"*Goodrich and Goodyear.*—The two rubber companies in question, Goodrich and Goodyear, have done appreciable research work of their own in the field of polymerization and have probably gained enough knowledge to handle the production of Buna type products. From a technical standpoint both rubber companies seem to be well qualified for the granting of a license under the I. G. patents. However, the Goodrich Company may deserve preferential consideration in this respect due to their outstanding development work and widespread technical use of Perbunan for mechanical articles. Both rubber companies have available sources of supply for Butadiene as well as Styrene and Acrylicnitril" (exhibit 78).

STANDARD FEELS OUT THE RUBBER COMPANIES

On November 6, 1939, Howard sent letters to all the major rubber companies almost identical with the following which went to J. W. Thomas, president of Firestone:

"Some time ago you were supplied with samples of the Buna synthetic rubbers. Since then you have continued to show an active interest in this development. *I have now to inform you that the I. G. Farbenindustrie has withdrawn completely from participation in this Buna development in the United States.*

"Dr. M. B. Hopkins, of our company, has been designated to follow the Buna developments for us. I would appreciate your letting me know if he may call upon you to discuss them with you or your associates.

"We do not desire to make any public statements on this matter at present and would appreciate it if you would also refrain from public comment for the time being" (exhibit 79).

The statement made in each of these letters that "I. G. Farbenindustrie has withdrawn completely from participation in this buna development in the United States" was false and misleading. As has been shown, I. G. Farben retained, as a result of the Hague Memorandum, the right to participate in buna royalties to the extent necessary to make an equitable diversion between the two companies. The extent to which I. G. Farben was still actively participating in the buna development, as demonstrated by its strict control of the license agree-

Digitized by Google

ment provisions, will be seen by an examination of this sheaf of cables beginning October 16, 1939, and ending July 31, 1940. In this last cable Howard thanks ter Meer for having finally sent the patent assignments (exhibit 80).

On November 6, 1939, Murphree gave Howard a statement indicating that the estimated total cost of Buna S, including depreciation, was 18.5 cents per pound (appendix 27, exhibit 81).

On the same day, November 6, 1939, Howard prepared a memorandum, presumably for the executive committee, on the situations with relation to buna and butyl. It contains the following statements:

"The company which is taking the largest quantities, the Goodrich Rubber Co., has applied for a license to manufacture the product. They have definitely stated that they do not need any technique from Germany, but require only a bare patent license—and that if refused a license, they are going to proceed anyway with the alternative processes which they think will be noninfringing.

"A year ago the Goodyear and Dow companies made an application to the I. G. and ourselves for an exclusive license for Buna N (the high-priced specialty rubber) for the United States. No final answer was given, but it seemed quite apparent that they could not obtain the exclusive license they wanted. What they have done since we have not yet been able to find out. The U. S. Rubber Co. have consistently displayed an active interest in Buna N.

"The tests of the Buna S (the tire rubber) have been under way in the U. S. throughout the summer by Goodyear, Goodrich, Firestone, and U. S. Rubber. None of the companies has been able to substantiate completely the I. G. claim of a 30% increase in mileage, but apparently all of them (save Goodyear) have obtained some definite increase in mileage, and they all recognize the product as superior to present tread rubber in wearing qualities. They also seem confident that with more experience in the handling and compounding of the product with American materials they can improve present results. The Goodrich Company has made a definite statement that they would expect themselves to provide an outlet for approximately 100 to 200 tons per day of the Buna S, if it could be supplied to them at a price of 25¢.

"We have assumed to the I. G. the obligation to discuss with the du Pont Company the entire situation before deciding on our policy here, and these discussions will take place very soon.

"Our own butyl rubber development is being pushed aggressively in our own laboratories, but without outside cooperation up to this time. The only outside contact we have had on butyl rubber has been with the Munitions Board, through whom we have had contact with the technicians of the Army and Navy concerning possible special uses of butyl rubber in munitions. There is a considerable temptation to publicize this butyl rubber development and to seek contact with the rubber companies on it immediately, but a sounder policy apparently is to confine the development to our own organization up to the point of standardized operation of our pilot plant about next January or February. This will *give us an opportunity to feel out the whole synthet c rubber situation in the United States with the du Pont company and with the four leading American rubber manufacturers through our contacts with them on the Buna matter.* The additional time is also desirable from a patent standpoint" (appendix 28, exhibit 82).

On November 9, 1939, Fisher and Hopkins met with Hochswender, Mueller, and Beller of I. G. Farben's New York representative, Chemnyco. In the memorandum of this discussion, dated November 9, the following is the last paragraph:

"Robinson [Robertson] of Goodrich asked regarding the cost of Buna S. He said the I. G. had indicated a price of 30¢ per pound but at this figure they would not be interested. At 25¢ per lb. they would be interested and would participate technically and financially in a production of 100–200 tons per day. He thought 100 tons or 5% of total U. S. consumption could be used without effect on rubber" (appendix 29, exhibit 83).

On November 10, 1939, Hopkins went to the Goodrich offices in Akron and conferred with their officials. These facts were known to him: (a) that Buna S could be produced and sold for 25 cents a pound at a substantial profit. He had just received two days previously cost figures of 18.5 cents including depreciation, (b) that Goodrich would be interested at a price of 25 cents per pound and would participate technically and financially in a production of 100–200 tons per day. He had so stated in a memorandum written the preceding day.

Digitized by Google

He had a conference with five representatives of Goodrich. Two versions of the conference are attached (appendix 30, exhibit 84), one a letter from Hopkins to Howard dated November 13, 1939, and the other a memorandum dated November 14, 1939, of W. F. Avery, Assistant Secretary (also attorney) of Goodrich, who attended the meeting (appendix 31, exhibit 85). There are no apparent conflicts in the two versions and therefore it is a reasonable assumption that each writer was giving his best recollection of what was said. Some of the statements in the Goodrich version which are not found in the Standard letter are quotations of Hopkins to the effect that Buna S will have to be subsidized by the Government, but that Buna N could be made commercially. Further:

"*Dr. Hopkins said that a chemical company was now making acrylic nitrile under license from I. G. which, however, would not permit them to make this material for synthetic rubbers* and that this chemical company wants the right to make it for Buna rubbers and also has asked for a license to make Buna products. * * * Dr. Hopkins stated that S. O. D. [Standard Oil Development] desired to control Buna S because the raw materials for making it come from petroleum" (appendix 30, exhibit 84).

Some of the statements in Hopkins' letter not exactly duplicated in Avery's memo are the following:

"Goodrich is definitely interested in Perbunan and asked for a license to go into manufacture immediately. The license need not be exclusive.

"With regard to Buna S, Goodrich finds it as good as or a little better than natural rubber. *At a competitive price, they would be quite willing to use it to replace natural rubber.* They consider that production of at least 100 tons per day in the United States would be necessary to make it practical commercially from the standpoint of rubber companies taking hold.

"*The most important point made by Goodrich in favor of independent production by the different rubber companies is that the immediate supply problem could be best met if it were not necessary to take the time to get all the companies working together*" (appendix 31, exhibit 85).

Letters reporting on conferences held with other rubber company representatives at about the same time are attached. Appendix 32, exhibit 86, is a letter dated November 13, 1939, from Hopkins to Howard concerning the Firestone conference. Appendix 33, exhibit 87, is a similar letter dated November 15, 1939, concerning United States Rubber. Appendix 34, exhibit 88, is a similar letter dated November 22, 1939, concerning General Tire & Rubber Co. and appendix 35, exhibit 89, concerning a conference held with Goodyear representatives.

In the report concerning Firestone, Hopkins states:

"Firestone is interested in any synthetic rubber development, but it was quickly apparent that immediate interest in Bunas is not as keen as that of Goodyear and Goodrich. This is possibly for the reason that Firestone has done no work to manufacture synthetic rubber such as has been done by the others."

Compare also the statement from the letter concerning United States Rubber.

"U. S. Rubber has not done as much with synthetic rubbers as Goodyear and Goodrich. Without waiting for the results of the tire tests they feel fairly certain that Buna-S would be a very good substitute for rubber if it could be produced at a satisfactory price. * * * He [Roberts, Vice Pres.] said that if his company had the Buna patents they would not hesitate to move fast in getting a plant going. If, therefore, Jersey was considering licensing a rubber company, U. S. Rubber Company would be very much interested in taking a license. *They would, however, want the license to be exclusive.*"

The foregoing are the reports of the conferences which Hopkins held with Chemnyco officials November 9, with Goodrich and Firestone November 10, and with United States Rubber, November 14.

STANDARD MISLEADS THE MUNITIONS BOARD

On November 15, 1939, Howard and Hopkins conferred with officers of the Munitions Board (appendix 36, exhibit 90). Appendix 37, exhibit 91, is Howard's memorandum of that meeting. Appendix 38, exhibit 92, is Maj. James C. Browne's report of the same session. Knowing the facts as to costs, which were known only to the Standard officials, and knowing what the rubber company representatives had said, as disclosed in the various reports, positive misstatements must have been made to Major Browne and the other officers to create the impression

Digitized by Google

which resulted in the report of November 16, 1939. For example, Browne's report quotes the Standard officials:

"(3) No company wants to pioneer the development of Buna S on such a large scale that would be necessary to make the United States self-sufficient in respect to rubber—peacetime competition with natural rubber prevents and the resultant financial burden is too much" (appendix 38, exhibit 92).

The fact which Major Browne should have been given is that no rubber company had been given an opportunity to participate in the pioneering of the development of Buna S on any scale. In the middle of page 2, Major Browne states:

"It was indicated that these companies would probably be pleased to acquire the license from Buna N but *would react unfavorably to the proviso requiring the development of Buna S.* A Government subsidy, guarantee, or some sort of outlet for tires fabricated from Buna S would help carry the burden and ameliorate this restrictive contractual clause."

Such a distortion of the attitude of the rubber companies toward developing Buna S was so unjustified that Howard himself suggested in his memorandum of November 22, 1939, to the Munitions Board that "it is hardly fair to say that the rubber companies would 'react unfavorably' to the development of Buna S for tire purposes" (appendix 39, exhibit 93). The fact remains that such was the impression created by Hopkins and himself as reflected in Major Browne's report. Major Browne sent copies of Howard's corrections to the various officers (appendix 40, exhibit 94).

HOWARD ORIGINATES THE TRICKY LICENSE AGREEMENT

In his memorandum of November 17, 1939, Howard said:

"It would probably not be lawful to license the Buna rubber on condition that the butadiene supplies be purchased from us. It might be possible for us to license on condition that each licensee cross-license us under his own improvements, but not require the licensee to pass such a cross-license through us to other licensees. If this proved possible, the effect would be that we should have the right (and would be the only company to have a right) to operate under all of the Buna-N basic and improved patents of all manufacturers. This might possibly be of value to us but we could only capitalize it by actually engaging in the business ourselves. If we want to do this it would be better to do it at the outset" (appendix 37).

Such a license agreement was drawn and was tendered to the major rubber companies. (See appendix 41, exhibits 95 and 96.) In addition to this objectionable cross-licensing feature, it fixed a very high royalty rate of 7½ cents per pound and prohibited manufacture for sale as distinguished from manufacture for use. M. B. Hopkins in a memorandum dated February 1, 1940, described the license as follows:

"The most important terms of the licensing arrangement are:

1. The rubber company takes a license to produce for consumption in its own products but not for sale otherwise. It gives us an option to buy one-fourth of its plant capacity for distribution to the trade generally.
2. A high royalty rate (7.5¢ per lb.) is fixed so as to make the operation practical for the rubber company only so long as the product is used as a relatively high-cost specialty.
3. The rubber company agrees to license back to us its improvements.

"The effect of these terms is to limit rather drastically what the rubber companies may do under their license and to leave Jersey free to itself manufacture and sell, or participate along with rubber companies in a manufacturing organization, or confine its activities to licensing and supplying raw materials. Therefore, the licenses offered may be considered as a stopgap arrangement to permit the rubber companies to get into quick production of Perbunan for specialty use if they so desire. Beyond this, there has been no decision as to how the development will be advanced" (appendix 42, exhibit 97).

W. E. Currie, Standard patent attorney, in a pencilled memorandum characterized the license agreement as follows:

"The agreement as it is now drafted will lead to the centering of all patent rights of Licensees in the hands of Licensor, with no outflow of those rights except to customers of Licensor (and in two minor phases of patents, to Licensor's licensees).

Digitized by Google

"All manufacturing patent rights of Licensees will help to build up Licensor's dominating position, but no Licensee will get the benefit of any other Licensee's manufacturing patent rights. In other words, this is not a cross-licensing agreement, but one in which patents are piled on patents in the hands of one centralizing company" (exhibit 98).

F. A. Howard in a memorandum of January 2, 1940, described the license situation as follows:

"To meet the pressure for Perbunan in the United States, we agreed to offer licenses to the four largest rubber companies under the I. G. synthetic rubber processes but only under conditions which would still leave open to us the possibility of entering the business actively in some way ourselves. The main limitations were a rather high royalty rate, seven and one-half cents per pound, the limitation on production to the licensee's own requirements, and rather far-reaching cross-licensing provisions.

"Of the four companies to whom these proposals have been made, only Goodrich and Goodyear have been active in following them up. Discussions with these companies indicate that to the extent we meet their wishes for the liberalization of the licensing contracts we shall cut away the foundations upon which our own plans would have to rest. While we have told them that in general it is our hope to work out some joint project ultimately, we have assumed no commitment to do so and therefore at the present time they are looking at the license contract we are offering to them as though it were the only thing they would ever receive from us. One cannot blame them for being critical of many of its provisions under these conditions" (appendix 43, exhibit 99).

When the license, with its objectionable features, was submitted to Goodyear its manager, L. B. Sebrell, wrote M. B. Hopkins on December 7, 1939, pointing out the provisions which Goodyear could not accept (exhibit 100). In general, these were the restrictive provisions referred to by the Standard officials above. Standard refused to change the terms of the license and negotiations between the parties stopped in February 1940. (See executive committee memorandum of February 9, 1940, appendix 44, exhibit 101.)

Goodrich had likewise objected to the provisions of the license (1) which piled up improvements in Standard Development, the licensor, and (2) which prohibited manufacture for sale to others than Standard. The executive committee memoranda of January 25, 1940, show that "Mr. Howard said that he did not favor surrendering on these two points, and committee expressed their accord with that view" (appendix 45, exhibit 102).

Thus Goodyear and Goodrich, who had done more experimental work in the field of synthetic rubber than the other two major rubber companies, were left out of the picture. Hopkins in his letters to Howard had pointed out that neither Firestone nor United States Rubber had either the interest or the experience in synthetic rubber of Goodyear and Goodrich.

Firestone agreed to take the license offered, except for minor changes, in March 1940. In notifying the executive committee of this in his letter to A. C. Minton March 7, 1940, Howard suggested using the Firestone agreement to force immediate acceptance of their license by the other companies.

"I believe we are far enough advanced with our butyl rubber development so that we could now bring this into the discussions, *although our natural course would be to hold off some time longer on any disclosure of butyl rubber*" (appendix 46, exhibit 103).

This was exactly 2 years after the full disclosure of butyl rubber to the Germans.

Standard knew that its own butyl process made it possible to produce synthetic rubber more cheaply than could be done by any other process. The plan was to force the reluctant rubber companies to accept the objectionable license on buna by using the threat implicit in the disclosure of the butyl process. The first public announcement of butyl was made at the stockholders' meeting June 4, 1940 (appendix 47, exhibit 104). The final sentences in Farish's announcement were:

"As in the case of Buna rubber, the commercial development of the Butyl rubber will be in stages, the first stage being the manufacture of relatively small quantities for the specialty market and for commercial testing in tire production. Should it become necessary for the United States to produce synthetic rubber in substitution for a major portion of imported natural rubber, we are in a position to manufacture the Butyl Rubber from petroleum in any required quantities as rapidly as the necessary plant facilities can be installed."

Digitized by Google

United States Rubber was the only company, other than Firestone, to accept the license as drawn. This was done on June 18, 1940 (appendix 48, exhibit 105).

The action which resulted in the licensing of Firestone and United States Rubber, and the exclusion of Goodrich and Goodyear, was not based on the absence of information by Standard. A broad study of the financial resources, the productive capacities, the investments in natural rubber plantations, and the experimental work in the synthetic rubber field by the four major companies had been made by Standard in the fall of 1939. This was at the time of the negotiations on the licensing contracts. A report of R. W. Lebo of Standard, on November 28, 1939, concerning the four major companies stated:

"The data presented show Goodyear and U. S. Rubber to be approximately equal in broad interests and abilities. [Mr. Lebo was apparently not familiar with Mr. Hopkins' reports to the effect that U. S. Rubber could not compare with Goodyear and Goodrich in regard to interest in and experience with Buna rubber.] In choosing one of these companies to do business with, *the object in mind would be in the deciding factor. If one was interested in large tire volume as the main requirement, a tire volume which was inherently steady and a fair volume of diversified rubber products, Goodyear would be the choice.* Should the chief interest be with diversified products along with a fair tire volume although possibly less stable, U. S. Rubber would be the choice" (exhibit 106).

STANDARD'S PLAN FOR ONE BIG COMPANY DOMINATED BY IT

In view of the positive assertion to the rubber companies on November 6, 1939, that I. G. Farbenindustrie had withdrawn completely from the buna development in the United States, it is surprising to note the contents of the cables between Howard and I. G. from November 14, 1939, until the following summer. On November 14, 1939, Howard cabled I. G. Farben as follows:

"Termeer ringer pursuant to my promise have discussed buna question with du Ponts before talking to others stop Their first position was that they would be willing to consider matter only on basis of exclusive license for straight royalty and even then only if we could not find any other satisfactory method of developing the process here stop They have just advised today however that they would like to consider taking a non-exclusive license on any fair basis on which we offer such licenses to others stop We shall continue to keep in contact with them" (exhibit 80A).

On December 22, 1939, Howard sent I. G. Farben another cable. The first few sentences are as follows:

"TERMEER RINGER. *Plan handling Buna as follows: First we desire ultimately group leading rubber companies in common company with us for most economical manufacture.* Stop. We cannot yet determine whether desirable include du Pont or other chemical interests in this venture."

The substance of the proposed license is then stated. The complete cable is found in appendix 49, exhibit 106.

The plan for one big company, to be dominated by Standard, for exploitation of synthetic rubber is more fully outlined in Howard's memorandum of January 2, 1940, previously referred to. He states:

"The outline of a plan for such a company might be as follows:

"Outline of industry company

"1. We would organize a corporation to which we would assign all of the I. G.-Jersey patent rights in the synthetic rubber field in return for all of its capital stock.

"2. 49% of the stock of this corporation would then be offered to all American rubber companies in proportion to their consumption of rubber for the last accounting period. For example, one share per ton per annum, which would mean perhaps 700,000 shares. Offering price on this basis might be a nominal figure of $1.00 per share. * * *

"The general purpose and effect of this plan would be to create a synthetic rubber business in which the supplier of the raw material and the owner of the original processes, that is Jersey, would have a one-half beneficial interest and control of the company, and the potential consumers of the product would have the other one-half interest. Each potential consumer would have a right to produce for his own requirements, but only at a rather high royalty rate. This

Digitized by Google

royalty rate plus the economies of the common plan would, however, be a maximum limit upon the total profit of the common company. * * *" (appendix 43, exhibit 99).

THE BIG PLAN HAS ITS FLAWS

Mr. Edward F. Johnson, attorney for Standard, gave his impression of Howard's big company plan in two letters to Howard. The first is dated March 12, 1940, and is worded as follows:

"DEAR FRANK: The attached memorandum contains a summary of my first impression of the essential facts involved in the synthetic rubber matter from the antitrust standpoint. Before going further, will you please read the memorandum and advise me whether or not you consider that any additional facts contained in the data which you gave me ought to be considered in determining the antitrust question" (exhibit 107).

The attached memorandum reads as follows:

"Jersey would own 51% of the voting stock of the New Company. 49% of such stock would be offered to all American rubber companies on the basis of their rubber consumption for the most recent accounting period. Arrangements might be made to adjust shareholdings of non-Jersey stockholders from time to time to keep them in line with their rubber consumption respectively. Newcomers in the rubber industry would be given the opportunity of joining the enterprise under fair conditions. There is no intention of excluding any rubber manufacturer from the opportunity of joining the enterprise.

"The New Company would hold:

(1) All patent rights of I. G. and Jersey in the synthetic rubber field;

(2) Cross-licenses under non-Jersey stockholders' patents in the synthetic rubber field covering improvements in the manufacture of synthetic rubber;

(3) An agreement that non-Jersey stockholders would not sue the customers of the new company for compounding and using synthetic rubber produced by the new company.

"The New Company would grant licenses to its stockholders, giving them the right to use the patents of the New Company in the manufacture of each stockholder's own requirements of synthetic rubber at the royalty rate of 7½¢ a pound. It is not expected that the licensees would engage directly in the manufacture of synthetic rubber under normal conditions.

"The New Company would engage directly in the manufacture of synthetic rubber and sell it to the industry.

"The New Company would grant to Jersey the preferred right to supply raw materials to the extent that they can be produced from oil or natural gas provided Jersey offers terms as favorable as any other supplier.

"There are other features of the plan which it is not necessary to consider in dealing with the antitrust question" (exhibit 108).

On March 13, 1940, Howard gave the following memorandum to Johnson:

"DEAR ED: The next to last paragraph of your memorandum reading:

> The new company would grant to Jersey the preferred right to supply raw materials to the extent that they can be produced from oil or natural gas provided Jersey offers terms as favorable as ny other supplier.

should be considered as out of the proposal as neither wise nor necessary.

"Aside from this I believe your summary is correct and sufficiently detailed for immediate purposes" (exhibit 109).

After submitting the plan to other counsel, Johnson wrote the following letter to Howard on April 2, 1940:

"DEAR MR. HOWARD: Since I do not have an extra copy of the memorandum in which Mr. Davis expressed his views on the rubber matter, I quote Mr. Davis' note in its entirety, as follows:

"'Jersey, as the holder of patents covering the production of synthetic rubber, is clearly entitled to produce synthetic rubber under its patented processes, and to exclude all others from the use of the patents. It is equally entitled to form a new corporation to operate under these patents. Further, I see no objection to Jersey, if it chooses, permitting others through stock ownership to acquire an interest in this new corporation, or granting of licenses by Jersey to others permitting them to operate under the patents. Nor is there necessarily any objection to having the new corporation acquire cross-licenses from persons holding other patents useful in the manufacture of synthetic rubber.

Digitized by Google

"'The ownership of patents, however, cannot be used as a cloak, whether directly or indirectly, to cover violations of the antitrust laws. So the fact that Jersey owns a particular group of patents on synthetic rubber cannot be used as a basis for preventing or restraining competition by others in the manufacture of synthetic rubber, whether under their own patents or otherwise, except to the extent that the processes of these others infringe upon the Jersey patents. Consequently, I should have considerable hesitation in approving any plan which would result in discouraging or preventing others from manufacturing or developing synthetic rubber under their own processes; and to the extent that the proposed plan involves the taking in of potential competitors as stockholders in the new company, its purpose and effect from this angle should be carefully considered.'

"It is clear to the lawyers that the plan suggested in your memorandum is one which in our judgment cannot be successfully defended. It seems to me to be important that before commitments are made we have an opportunity to study any new proposition and to discuss it with Mr. Davis.

"Indications are that the Supreme Court will limit the scope of patent rights to the field covered by the grant and will not permit the extension of the patent monopoly through agreements with others. Even a set-up providing for stock participation by the rubber industry in a company owning our patent rights in the synthetic rubber field will have to be, in my judgment, very carefully analyzed. It is possible, though I know of no decision so holding, that the Supreme Court could well say that the combination brought about through stock ownership in the new company would of itself constitute a monopoly not inherent in the patent itself, and that because of such combination the interests of the rubber industry would be so tied to the new corporation as to tend to remove what otherwise would be normal competition. Otherwise stated, although the patent permits us to have and to exercise a monopoly, it may be held that, while bringing others into the patent holding company as stockholders does not extend the scope of the patent, it does tend to remove the incentive of the industry to bring about competition through inventive or other means. Cross-licensing provisions would add support to this theory. This may not be even a probable result of such plan, though it seems to me to be well within the realm of possibility" (exhibit 110).

Howard may have been temporarily slowed down on his grandiose scheme by the warnings of the lawyers. Certainly he was not completely dissuaded. Two months later he proposed that this impediment to Standard's achieving a monopoly be brushed aside. In a letter to E. R. Stettinius, Jr., member of the Advisory Commission for National Defense, dated June 11, 1940, Howard, after discussing the financial problems incident to the synthetic-rubber program, states:

"Entirely aside from the financial questions, there is the difficulty which the antitrust laws present in attempting to formulate any plan for cooperation along financial 'technical' and patent lines between competitive units * * *"

and further—

"In our opinion, enabling legislation, removing the real or arguable cloud thrown by the antitrust laws on any corporative plans of this character, is therefore essential" (appendix 50, exhibit 111).

TEAGLE STILL FAVORS A DU PONT PARTNERSHIP

On January 9, 1940, Howard attached a copy of the memorandum containing his big company plan to a memorandum to R. W. Gallagher, Standard's director. The following is a copy (exhibit 112):

"DEAR RALPH: I have had a talk with Mr. Teagle in which I brought him up to date on the main outlines of the chemical problems we have recently been considering, and he also read a copy of the attached memorandum on the synthetic-rubber matter.

"He wishes to think the situation over a little and talk to you and me together about it before he returns to Georgia. The memorandum may be of some assistance to you in preparation for this talk.

"I might say that Mr. Teagle's mind seems to be going in the direction that a Dupont partnership would be a better solution of the synthetic -rubber problem than any other.

"I am not yet ready to reach any final conclusion myself. I certainly do not particularly favor at this moment the plan covered by the attached memorandum; it seemed necessary to have some concrete statement of this situation, however,

Digitized by Google

"All manufacturing patent rights of Licensees will help to build up Licensor's dominating position, but no Licensee will get the benefit of any other Licensee's manufacturing patent rights. In other words, this is not a cross-licensing agreement, but one in which patents are piled on patents in the hands of one centralizing company" (exhibit 98).

F. A. Howard in a memorandum of January 2, 1940, described the license situation as follows:

"To meet the pressure for Perbunan in the United States, we agreed to offer licenses to the four largest rubber companies under the I. G. synthetic rubber processes but only under conditions which would still leave open to us the possibility of entering the business actively in some way ourselves. The main limitations were a rather high royalty rate, seven and one-half cents per pound, the limitation on production to the licensee's own requirements, and rather far-reaching cross-licensing provisions.

"Of the four companies to whom these proposals have been made, only Goodrich and Goodyear have been active in following them up. Discussions with these companies indicate that to the extent we meet their wishes for the liberalization of the licensing contracts we shall cut away the foundations upon which our own plans would have to rest. While we have told them that in general it is our hope to work out some joint project ultimately, we have assumed no commitment to do so and therefore at the present time they are looking at the license contract we are offering to them as though it were the only thing they would ever receive from us. One cannot blame them for being critical of many of its provisions under these conditions" (appendix 43, exhibit 99).

When the license, with its objectionable features, was submitted to Goodyear its manager, L. B. Sebrell, wrote M. B. Hopkins on December 7, 1939, pointing out the provisions which Goodyear could not accept (exhibit 100). In general, these were the restrictive provisions referred to by the Standard officials above. Standard refused to change the terms of the license and negotiations between the parties stopped in February 1940. (See executive committee memorandum of February 9, 1940, appendix 44, exhibit 101.)

Goodrich had likewise objected to the provisions of the license (1) which piled up improvements in Standard Development, the licensor, and (2) which prohibited manufacture for sale to others than Standard. The executive committee memoranda of January 25, 1940, show that "Mr. Howard said that he did not favor surrendering on these two points, and committee expressed their accord with that view" (appendix 45, exhibit 102).

Thus Goodyear and Goodrich, who had done more experimental work in the field of synthetic rubber than the other two major rubber companies, were left out of the picture. Hopkins in his letters to Howard had pointed out that neither Firestone nor United States Rubber had either the interest or the experience in synthetic rubber of Goodyear and Goodrich.

Firestone agreed to take the license offered, except for minor changes, in March 1940. In notifying the executive committee of this in his letter to A. C. Minton March 7, 1940, Howard suggested using the Firestone agreement to force immediate acceptance of their license by the other companies.

"I believe we are far enough advanced with our butyl rubber development so that we could now bring this into the discussions, *although our natural course would be to hold off some time longer on any disclosure of butyl rubber*" (appendix 46, exhibit 103).

This was exactly 2 years after the full disclosure of butyl rubber to the Germans.

Standard knew that its own butyl process made it possible to produce synthetic rubber more cheaply than could be done by any other process. The plan was to force the reluctant rubber companies to accept the objectionable license on buna by using the threat implicit in the disclosure of the butyl process. The first public announcement of butyl was made at the stockholders' meeting June 4, 1940 (appendix 47, exhibit 104). The final sentences in Farish's announcement were:

"As in the case of Buna rubber, the commercial development of the Butyl rubber will be in stages, the first stage being the manufacture of relatively small quantities for the specialty market and for commercial testing in tire production. Should it become necessary for the United States to produce synthetic rubber in substitution for a major portion of imported natural rubber, we are in a position to manufacture the Butyl Rubber from petroleum in any required quantities as rapidly as the necessary plant facilities can be installed."

royalty rate plus the economies of the common plan would, however, be a maximum limit upon the total profit of the common company. * * *" (appendix 43, exhibit 99).

THE BIG PLAN HAS ITS FLAWS

Mr. Edward F. Johnson, attorney for Standard, gave his impression of Howard's big company plan in two letters to Howard. The first is dated March 12, 1940, and is worded as follows:

"DEAR FRANK: The attached memorandum contains a summary of my first impression of the essential facts involved in the synthetic rubber matter from the antitrust standpoint. Before going further, will you please read the memorandum and advise me whether or not you consider that any additional facts contained in the data which you gave me ought to be considered in determining the antitrust question" (exhibit 107).

The attached memorandum reads as follows:

"Jersey would own 51% of the voting stock of the New Company. 49% of such stock would be offered to all American rubber companies on the basis of their rubber consumption for the most recent accounting period. Arrangements might be made to adjust shareholdings of non-Jersey stockholders from time to time to keep them in line with their rubber consumption respectively. Newcomers in the rubber industry would be given the opportunity of joining the enterprise under fair conditions. There is no intention of excluding any rubber manufacturer from the opportunity of joining the enterprise.

"The New Company would hold:

(1) All patent rights of I. G. and Jersey in the synthetic rubber field;
(2) Cross-licenses under non-Jersey stockholders' patents in the synthetic rubber field covering improvements in the manufacture of synthetic rubber;
(3) An agreement that non-Jersey stockholders would not sue the customers of the new company for compounding and using synthetic rubber produced by the new company.

"The New Company would grant licenses to its stockholders, giving them the right to use the patents of the New Company in the manufacture of each stockholder's own requirements of synthetic rubber at the royalty rate of 7½¢ a pound. It is not expected that the licensees would engage directly in the manufacture of synthetic rubber under normal conditions.

"The New Company would engage directly in the manufacture of synthetic rubber and sell it to the industry.

"The New Company would grant to Jersey the preferred right to supply raw materials to the extent that they can be produced from oil or natural gas provided Jersey offers terms as favorable as any other supplier.

"There are other features of the plan which it is not necessary to consider in dealing with the antitrust question" (exhibit 108).

On March 13, 1940, Howard gave the following memorandum to Johnson:

"DEAR ED: The next to last paragraph of your memorandum reading:

> The new company would grant to Jersey the preferred right to supply raw materials to the extent that they can be produced from oil or natural gas provided Jersey offers terms as favorable as ny other supplier.

should be considered as out of the proposal as neither wise nor necessary.

"Aside from this I believe your summary is correct and sufficiently detailed for immediate purposes" (exhibit 109).

After submitting the plan to other counsel, Johnson wrote the following letter to Howard on April 2, 1940:

"DEAR MR. HOWARD: Since I do not have an extra copy of the memorandum in which Mr. Davis expressed his views on the rubber matter, I quote Mr. Davis' note in its entirety, as follows:

" 'Jersey, as the holder of patents covering the production of synthetic rubber, is clearly entitled to produce synthetic rubber under its patented processes, and to exclude all others from the use of the patents. It is equally entitled to form a new corporation to operate under these patents. Further, I see no objection to Jersey, if it chooses, permitting others through stock ownership to acquire an interest in this new corporation, or granting of licenses by Jersey to others permitting them to operate under the patents. Nor is there necessarily any objection to having the new corporation acquire cross-licenses from persons holding other patents useful in the manufacture of synthetic rubber.

Digitized by Google

"'The ownership of patents, however, cannot be used as a cloak, whether directly or indirectly, to cover violations of the antitrust laws. So the fact that Jersey owns a particular group of patents on synthetic rubber cannot be used as a basis for preventing or restraining competition by others in the manufacture of synthetic rubber, whether under their own patents or otherwise, except to the extent that the processes of these others infringe upon the Jersey patents. Consequently, I should have considerable hesitation in approving any plan which would result in discouraging or preventing others from manufacturing or developing synthetic rubber under their own processes; and to the extent that the proposed plan involves the taking in of potential competitors as stockholders in the new company, its purpose and effect from this angle should be carefully considered.'

"It is clear to the lawyers that the plan suggested in your memorandum is one which in our judgment cannot be successfully defended. It seems to me to be important that before commitments are made we have an opportunity to study any new proposition and to discuss it with Mr. Davis.

"Indications are that the Supreme Court will limit the scope of patent rights to the field covered by the grant and will not permit the extension of the patent monopoly through agreements with others. Even a set-up providing for stock participation by the rubber industry in a company owning our patent rights in the synthetic rubber field will have to be, in my judgment, very carefully analyzed. It is possible, though I know of no decision so holding, that the Supreme Court could well say that the combination brought about through stock ownership in the new company would of itself constitute a monopoly not inherent in the patent itself, and that because of such combination the interests of the rubber industry would be so tied to the new corporation as to tend to remove what otherwise would be normal competition. Otherwise stated, although the patent permits us to have and to exercise a monopoly, it may be held that, while bringing others into the patent holding company as stockholders does not extend the scope of the patent, it does tend to remove the incentive of the industry to bring about competition through inventive or other means. Cross-licensing provisions would add support to this theory. This may not be even a probable result of such plan, though it seems to me to be well within the realm of possibility" (exhibit 110).

Howard may have been temporarily slowed down on his grandiose scheme by the warnings of the lawyers. Certainly he was not completely dissuaded. Two months later he proposed that this impediment to Standard's achieving a monopoly be brushed aside. In a letter to E. R. Stettinius, Jr., member of the Advisory Commission for National Defense, dated June 11, 1940, Howard, after discussing the financial problems incident to the synthetic-rubber program, states:

"Entirely aside from the financial questions, there is the difficulty which the antitrust laws present in attempting to formulate any plan for cooperation along financial 'technical' and patent lines between competitive units * * *"

and further—

"In our opinion, enabling legislation, removing the real or arguable cloud thrown by the antitrust laws on any corporative plans of this character, is therefore essential" (appendix 50, exhibit 111).

TEAGLE STILL FAVORS A DU PONT PARTNERSHIP

On January 9, 1940, Howard attached a copy of the memorandum containing his big company plan to a memorandum to R. W. Gallagher, Standard's director. The following is a copy (exhibit 112):

"DEAR RALPH: I have had a talk with Mr. Teagle in which I brought him up to date on the main outlines of the chemical problems we have recently been considering, and he also read a copy of the attached memorandum on the synthetic-rubber matter.

"He wishes to think the situation over a little and talk to you and me together about it before he returns to Georgia. The memorandum may be of some assistance to you in preparation for this talk.

"I might say that Mr. Teagle's mind seems to be going in the direction that a Dupont partnership would be a better solution of the synthetic -rubber problem than any other.

"I am not yet ready to reach any final conclusion myself. I certainly do not particularly favor at this moment the plan covered by the attached memorandum; it seemed necessary to have some concrete statement of this situation, however,

Digitized by Google

before we could think clearly about it, and the memorandum was only intended to serve that purpose.

"F. A. HOWARD."

STANDARD'S COST FIGURES NOT DISCLOSED

In the summer of 1940 Standard entered upon an intensive campaign to secure a synthetic-rubber program along the following lines: It desired the Government to finance a large development of buna rubber in which the rubber companies and Standard would participate. At the same time Standard would hold out its butyl development.

In June it caused computations to be made showing the investment and production costs of Buna S and butyl rubber in plants of 100 tons per day and 300 tons per day capacity. As has been stated heretofore, the figures were as follows for a 300 ton per day plant, or approximately 109,000 tons per year:

	Buna S	Butyl
Investment	49,600,000	23,800,000.
Production cost	14.4 cents per pound	6.6 cents per pound.
15 percent return on the investment would add	3.2 cents per pound	1.63 cents per pound.
Total cost, including 15 percent return	17.6 cents per pound	8.23 cents per pound.

The withholding of this information from the Government representatives is one of the most unfortunate factors in the entire synthetic rubber story. The reason the figures were kept secret is obvious. Standard could not have made its campaign for Government financing, subsidy, and pressure upon the rubber companies if it had not kept alive the false impression that synthetic rubber could not be made and sold at prevailing natural rubber prices—20 cents per pound then, 22½ cents per pound subsequently.

This erroneous impression is shown in a newspaper story found in the Standard files. It is a clipping from the Journal of Commerce for October 1, 1940. It contains the following statement by Mr. Jesse Jones of the Reconstruction Finance Corporation:

"Mr. Jones stressed that production costs of artificial rubber, according to Devense Commission estimates, are 25¢ a pound compared with a price of 18¢ to 20¢ a pound paid by the Government for natural rubber for the strategic materials reserve stock pile. He added that estimates worked out so far show that it should cost $500 per ton of capacity to build plants for the production of the synthetic product" (exhibit 113).

For 109,000 tons this investment cost is $54,750,000 as compared with Standard's figures of $49,600,000 for Buna S and $23,800,000 for Butyl rubber.

PRESSURE FOR GOVERNMENT FINANCING

On July 11, 1940, Howard prepared a memorandum for Farish reporting a discussion with officials of Firestone and United States Rubber:

"Out of our discussion on this line we arrived at the following conclusion: that the synthetic rubber field might be regarded as made up of three branches—the Neoprene branch, the Butyl rubber branch, and the Buna rubber branch. No one save du Pont knew anything about Neoprene or claimed to have any patent position or experience. The same applied to Jersey as regards butyl rubber. As regards Buna, this was of course primarily a German development which Jersey had taken over for the U. S. There were several other American companies however who had done a certain amount of work in various branches of the Buna development. In view of this situation it would be logical to ask all the companies interested in the various stages of the Buna development to pool their patent rights and experience if a Government-financed emergency plant were decided to be necessary. Both du Pont and Jersey might join in this pooled effort in connection with an emergency Buna plant, each retaining its separate position as to Neoprene and butyl rubber" (exhibit 114).

The Advisory Commission to the Council of National Defense (of which E. R. Stettinius, Jr., was a member) had a synthetic rubber committee. This committee held a meeting to consider a plan for synthetic rubber development on July 17, 1940. Howard reported the meeting in a memorandum of July 18, 1940, which contains the following statement:

Digitized by Google

"The tentative program on synthetic rubber as agreed to by the Stettinius group committee at their meeting July 17 is as follows:

"(1) The Government should finance plans for the construction of facilities for the production of 100,000 tons per annum synthetic rubber, divided about as follows: Neoprene, 10,000 tons; Butyl, 30,000 tons; Buna, 60,000 tons" (exhibit 115).

On July 30, 1940, Howard sent a memorandum to Dr. Robert E. Wilson, president of Pan American Transport Co., who was in Washington as a member of the committee which had met on July 17. In the memorandum Howard advocated a plan:

"PLAN

"(1) To provide a permanent protection for synthetic tire rubber in the amount of at least 100,000 tons per annum.

"(2) To provide for the immediate erection of government-financed synthetic rubber tire plants of a capacity of about 60,000 to 80,000 tons per annum, with the expectation that the balance of the 100,000 ton capacity desired will be installed immediately by private initiative under the incentive provided by the protection.

"(3) To provide that all interested parties unite and contribute their patent rights and experience to the extent needed for the carrying out of a government-financed tire rubber program, and that the selection of projects and the allocation of funds be a responsibility of the rubber industry itself, and not the act of any administrative agency of the Government, but with a reserved government veto power.

"PROGRAM

"*1st step.*—Appropriate legislation to be immediately framed and introduced by the Administration authorizing the Treasury to rebate to tire manufacturers the excise tax on tires in proportion to the extent of their use of American produced rubber in such tires . . ." (exhibit 116).

He computed the protection thus given to be such that synthetic rubber would have a protection of 20 cents per pound over natural rubber.

The Standard executive committee memoranda for August 6, 1940, contain the following:

"Mr. Howard advised of receipt of a telegram from Mr. Clarence Francis of the National Defense Advisory Commission confirming the meeting to be held in Washington on August 7 to consider all necessary steps to provide total capacity for synthetic rubber of 100,000 tons per annum, and suggested methods of insuring a market for this quantity. The telegram advised, also, that the industry will be asked to engineer, at its own expense, plants which represent the practical commercial units fitting into the program, making whatever arrangements necessary for raw materials. Plants to be engineered should be in general accord with a feasible program for our interests alone or in cooperation with others. No definite commitments will be asked for at this time with respect to plant construction.

"Mr. Howard said it would be his preference that we not invest any considerable sums in the manufacture of buna rubber, but give such aid and advice as might be helpful. He preferred, in view of the greater possibilities of our interests' butyl rubber, to advise the Committee that we are considering building a plant to manufacture 10,000 tons per annum of butyl rubber, but that if the Government would be interested in giving protection to the extent of 5¢ per pound to the whole rubber field, our interests might be willing to construct a plant to manufacture up to 30,000 tons of butyl rubber per annum on a five-year contract basis" (exhibit 117).

The executive committee memoranda for August 8, 1940, contain the following statement:

"Mr. Farish advised Mr. F. A. Howard reported having attended a meeting with Messrs. Robert Wilson, Weidlin, and others in Washington yesterday on the subject of synthetic rubber supplies, at which meeting two general conclusions had been agreed to, i. e., that capacity for 100,000 tons per annum of synthetic rubber should be installed as soon as possible, and, in order to secure this result, two things would be necessary: (1) a permanent protection policy by the Government, and (2) Government financing, in large part, of any installations for this purpose" (exhibit 118).

Digitized by Google

At the meeting of August 7 just referred to, Standard undertook to prepare plans for a butyl plant. Clarence Francis, chairman of the Special Committee of the Advisory Commission of National Defense, wrote Howard August 14, 1940:

"It is the understanding of the Committee that your company is proceeding, at its own expense, with preliminary engineering plans for plant capable of producing 30,000 tons of synthetic rubber per year. In accordance with the memorandum circulated at the meeting, we understand that you will:

(*a*) Select site.

(*b*) Prepare plans sufficient for general process and plant lay-out. No details.

(*c*) Estimate plant costs and product cost based on 5-year amortization.

(*d*) Show separately any necessary additions to land or other parts of plant outside synthetic rubber boundary limits, i. e., power, roads, tracks, etc.

"It is our further understanding that these preliminary plans will have been completed and submitted to the Committee within two months of the date of the meeting, i. e., not later than October 7, 1940. If the plans can be completed in less time than this, the committee will appreciate it very much if they are submitted as soon as they are finished" (exhibit 119).

On August 23, 1940, Howard wrote Francis:

"We submitted at your meeting a pencilled statement saying that we were ready to proceed with the engineering of a butyl rubber project between 10,000 and 30,000 tons per annum pedending upon the kind and amount of financing and protection offered. In your letter you advised that we were understood to have offered to engineer a 30,000-ton plant. We realize that this is the time for action, not for delay, and are therefore proceeding without further question to engineer the 30,000-ton plant at a location where it can be expanded five fold at maximum speed if necessary. But when the plan for financing and protection is offered it may fail to meet our necessities to such an extent that the plant size and location may both be wrong. The result will be delay" (exhibit 120).

On October 7, 1940, the deadline for submission of plans and cost figures, Howard wrote a letter to the Chairman, Synthetic Rubber Committee, Advisory Council to Commission of National Defense:

"On August 23rd we advised Mr. Francis that we were proceeding with the general engineering studies, estimates, and plans for the production of 30,000 tons per annum of synthetic rubber, and it was understood by all that the project referred to was for the production of Butyl rubber. This work has gone forward; general plans and estimates have been completed and in case of necessity could be amplified in the detail necessary for actual construction as contemplated by the preparatory program of the Committee adopted at the last general meeting of all the interested parties in Washington.

"With the permission of the Commitee we should, however, like to hold these plans for the 30,000-ton Butyl project in reserve for the time being and to present, in substitution therefor, two engineering studies covering the manufacture of butadiene. One of these will be furnished by the Humble Oil & Refining Co. for a plant at Baytown, Texas, and the other we are submitting herewith in behalf of the Standard Oil Co. of Louisiana covering a plant at Baton Rouge" (exhibit 121).

The problem of financing the synthetic-rubber development was turned over to the Reconstruction Finance Corporation by the Advisory Commission to the Council of National Defense. Negotiations were had between Standard officials and Jesse Jones.

The executive committee memoranda of November 29, 1940, contain the following:

"Mr. Gallagher reported that in the last conference Messrs. F. A. Howard and H. C. Wiess had with Mr. Jesse Jones, the latter indicated it appeared the Government's view of cooperation in insuring some manufacture of buna rubber in the United States would be to accomplish what could be done for not more than $30,000,000. He said Messrs. Howard and Wiess, in reviewing this problem, were going to suggest to Mr. Jones that our interests give four rubber companies 10,000 tons per year each of synthetic rubber; that the rubber companies put a price of 30¢ per pound on sales of this rubber to the Government; and that the Government make prepayment to the rubber companies for a five-year supply of the rubber, which would mean 50,000 tons total from each rubber com-

Digitized by Google

pany. This would make available the required money for rubber companies' required capital investments for this purpose. If the Government for any reason did not buy all the quantity agreed upon, they would not have the privilege of recovering the prepayment from the companies. Jersey interests would expect to secure 1½¢ royalty per pound from two of the rubber companies, i. e., Firestone and U. S., but it is not clear just what they might do in this respect with the two other companies. Present discussions in Washington are going on somewhat along the above lines" (exhibit 122).

The Reconstruction Finance Corporation asked for proposals for the construction of four plants for the production of 40,000 tons per annum (exhibit 123).

The executive committee memoranda for February 25, 1941, contain the following:

"In this connection, Mr. Howard stated Firestone would like to join with our interests in recommending to the R. F. C. that it revise the agreed-upon rubber program so as to require a total of four 2,500-ton plants instead of four 10,000-ton plants, under which revised program it would not be contemplated that our interests would receive any financing through the R. F. C., nor would the rubber companies change their agreed-upon price to R. F. C. for synthetic rubber if our interests were willing to stand by their previously indicated price of 17¢ per pound for the butadiene. He said he would like to: (1) indicate to Firestone and U. S. Rubber that our interests favor this approach * * *" (exhibit 124).

Two days later, on February 27, 1941, Howard wrote W. L. Clayton, of the Reconstruction Finance Corporation, giving him a brief history of Standard's interest in the synthetic rubber business. He stated:

"As owners of the patents we are ready to license all four proposed plants on the basis already accepted by Firestone and U. S. Rubber. The principal difference of opinion between ourselves and the Goodyear and Goodrich companies at this time in connection with these licenses is the apparent desire of Goodyear and Goodrich to insist upon a license which would permit them to manufacture Buna type rubbers not only for use in their own plants for specialty purposes, but also for sale to other rubber manufacturers in competition with our production of Buna rubber for these specialty purposes in the plant which we are just now completing.

"We believe, and have acted and invested on the belief, that the synthetic rubber industry is in the long run economically sound, regardless of government assistance. We believe that within the next two years it may reach a total volume for all varieties of synthetic rubber of something like 35,000 tons per annum, which will probably be sold at prices in the range of about 35 to 75¢ per pound. This rubber will all be consumed in specialty markets, including a certain amount of premium-priced tire and tube products" (exhibit 125).

In a memorandum dated March 25, 1941, Howard discussed a plan for rubber program. Under this plan, Reconstruction Finance Corporation would advance funds for construction of four plants, each to have initial installed capacity of 2,500 tons and ultimate capacity of 10,000 tons. Each plant would be leased to one of the four leading rubber companies and it would obligate itself to produce not less than 625 tons of synthetic rubber per annum, including 312 tons of tire and tube rubber (exhibit 126). This plan was adopted by the Reconstruction Finance Corporation and, as outlined, contained the following provision:

"8. The R. F. C. will endeavor to secure satisfactory assurance from holders of patents that neither infringement nor royalties will be claimed in connection with the first year of this program."

Opposite the provision in the Standard copy of the proposed plan is the notation "our letter applied only to the production used in tires. F. A. H." Howard's initials are F. A. H. (exhibit 127).

PATENT RECOGNITION

On March 28, 1941, Howard wrote a letter to W. L. Clayton, Federal Loan Agency, in which he stated that Standard would "waive all patent royalties and infringement claims arising out of the manufacture, use, or sale at cost of small quantities (approximately 1,250 tons total) of synthetic tire rubber for experimental purposes under the one-year program which you are endeavoring to work out with the tire manufacturers" (exhibit 128).

Also on March 28, 1941, Howard wrote a letter to Dr. Robert E. Wilson:

"DEAR BOB: I have good reason to believe that an effort is being made to misrepresent the facts in connection with the Buna patents to various authori-

Digitized by Google

ties in Washington. The statements which are being circulated by persons who ought to know better are:

"(1) that the Germans have an interest in the Buna patents in the United States;

"(2) that Standard Oil Co. (New Jersey) is asking exorbitant royalties and other impossible conditions for a license;

"(3) that the rubber companies are quite sure that the Buna patents do not at all cover the products which they wish to make, but that they fear Standard will bring unwarranted suits.

"The attached memorandum covers what I think are the more important facts in this situation. In addition to the memorandum I am attaching a summary of and full text of the actual license contracts which were offered some months ago on the Buna patents to all four leading rubber companies. Firestone and U. S. Rubber have accepted an earlier draft of license contract for which the attached draft (which they have stated is agreeable to them in principle) is to be substituted.

"We would much prefer to handle this Buna matter entirely on its merits as a normal business transaction and to adjust our difficulties with the companies with whom we have not yet reached an agreement in the ordinary course of business. If, however, you should find that any effort is being made to bring the Government, directly or indirectly, into this Buna patent matter, I would be very pleased to have you use the attached memorandum in any way you see fit, and I would also, as you know, appreciate an opportunity to meet face to face anyone who has a complaint or criticism" (exhibit 129).

The attached memorandum dated March 28, 1941, is as follows:

"The Buna patent rights which Jersey controls in the main originate with the I. G. Farbenindustrie, with whom Jersey had a cooperative arrangement in this field for the ten years preceding the war. Just before the outbreak of the war Goodyear tried to acquire from the I. G. Farbenindustrie and Jersey an exclusive license under these patent rights for the United States. They were advised both by the I. G. and Jersey that they did not believe it was in the interest of the commercial development of this new industry to grant an exclusive license to anyone, but that they hoped to work out some plan under which the entire rubber industry could use the processes on a fair basis. On the outbreak of the war Jersey acquired from the I. G. their interest in the Buna patents for the United States and for the French and British Empires. The Goodyear company again endeavored to obtain from Jersey an exclusive license, which Jersey consistently refused to grant or discuss.

"The Goodrich company had also been in contact both with the I. G. and Jersey prior to the outbreak of the war. Their position was that they were further advanced in the manufacture of the Buna type synthetic rubbers than anyone else and that they would be glad to take a license provided they received special treatment commensurate with what they believed their special position in this field justified. After prolonged negotiation Jersey was unable to find any formula under which it could meet their desire for special consideration without putting Jersey in what it considered would be an impossible position vis-a-vis other licensees.

"Jersey states that it has never felt that it was practical to license these patents except on a uniform basis to all the four leading rubber manufacturers, and its opinion is that no one of these four largest companies is, in any important respect, sufficiently more advanced in the Buna field than the others, to justify more favored treatment than the others receive.

"The Firestone and U. S. Rubber companies have accepted a license from Jersey for the Buna process, and this same license has been offered both to Goodyear and to Goodrich, and is still open to them to accept.

"The rates of royalty asked in the license are from 3% to 7% of the sales price for various products and uses, with a maximum royalty of 1½¢ per lb. fixed on any rubber sold for tire purposes. The British Comptroller of Patents has fixed a flat royalty of 5% of the sales price for a much more limited license under similar patents in England under compulsory license proceedings. The license Jersey has offered has no limitation at all on the output or any attempt to control the prices. The one limitation which is important is that the licensees do not obtain the right to resell rubber for special purposes (uses other than tires and tubes). Jersey is willing to license any manufacturer to make such rubber for specialty purposes for his own consumption, but is itself in the business of making this rubber, and intends to reserve for itself under the

Digitized by Google

Buna patents the exclusive right to tell to rubber manufacturers who do not wish to (or are economically unable to) manufacture the product for themselves. The Buna rubber used and sold for specialty purposes is called "Perbunan" and is in direct competition with the du Pont company's product "Neoprene." The du Pont company have never been willing to license any manufacturer and still maintain a complete monopoly of this business. Jersey is breaking this monopoly by offering licenses to the rubber manufacturers to manufacture their own requirements of Perbunan and intends to be in direct competition with du Pont in the general market with its own Perbunan products" (exhibit 130).

On the same date March 28, 1941, Howard wrote R. R. Deupree, Chief of the Materials from Agriculture and Forest Products Section, Office of Production Management, and president of Procter & Gamble Co., the following:

"MARCH 28, 1941.

"Handed to Mr. Deupree in Mr. Teagle's office Friday morning (March 28th), not as a letter but as a memorandum which Mr. Deupree stated he would like to read, but would definitely destroy after reading.

"F. A. H."

"Mr. R. R. DEUPREE,
Washington, D. C.

"DEAR MR. DEUPREE: I understand that in substance the question is whether any patent situation exists in the synthetic-rubber industry which threatens to interfere in any way with the defense program.

"It is possible that the Goodyear and Goodrich rubber companies might assert that there is such a situation. The only basis for such assertion would be the fact that they have so far been unwilling to accept the license agreements which we have offered and which have been accepted by the Firestone and U. S. Rubber companies."

The remainder of the letter uses substantially the same language as in the previous memorandum (exhibit 131). On April 10, 1941, Howard wrote R. R. Deupree again and stated:

"If there is any real chance that our imports of rubber may be seriously reduced within the next two years (and I believe we all feel that there is some chance of this) I urge that we proceed at once with a program for the construction of four 10,000-ton rubber plants; one to be erected by each of the major tire manufacturers (who will have the responsibility himself for swallowing his own output of rubber in saleable tires) and simultaneously proceed with the necessary butadiene and styrene plants.

"I am sorry to say that I believe the record of the handling of this synthetic rubber matter, up to this moment, has not been a creditable one.

"It was our judgment in which the Firestone and United States Rubber Companies concurred that this 40,000-ton program represented the absolute minimum program which would meet the situation as it actually exists in the United States * * *" (exhibit 132).

On May 21 Frolich, director of the Esso Laboratories chemical division, attended a meeting in Washington under the auspices of Rubber Reserve Company (Reconstruction Finance Corporation), called by R. R. Deupree, of the Office of Production Management. Those present from industry were Street, of Firestone; Semon, of Goodrich; Dinsmore, of Goodyear; Roberts, of United States Rubber; Bridgewater, of du Pont; Curme, of Carbide & Carbon; and Frolich, of Standard Oil Development. Frolich reported the meeting in a confidential memorandum dated May 23, 1941, attached to a letter to E. V. Murphree dated May 26, 1941. The letter states:

"DEAR MR. MURPHREE: I am attaching some notes on the meeting held in Washington last Wednesday under the auspices of the Rubber Reserve Company to discuss a proposed Government project for the manufacture of 40,000 tons of tire rubber per annum.

"The proposal had the support of all the industrial representatives, but both Goodyear and Goodrich were in favor of going to 100,000 tons—Goodyear because of the imminent threat of a crude-rubber shortage and Goodrich on the ground that this would represent a more economical scale of operation. The opinions were somewhat divided in regard to the advisability of increasing the capacity of the recently authorized 2,500-ton polymerization units, as against constructing a new plant. The majority, however, was for utilizing the plants of the four major rubber companies" (exhibit 133).

Digitized by Google

In the memorandum Frolich states:

* * * * * * *

"It was agreed by all those present that in considering tire rubber we were primarily interested in neoprene and Buna S. However, very little was said about neoprene throughout the meeting, and the conversation centered entirely around Buna S, or, as it was frequently referred to, 'Buna S type rubber.'

"Even Dinsmore and Semon agreed that the raw materials with which we were concerned were butadiene and styrene. Neither one of them intimated that a substitute for styrene or a third component might enter into the picture. The only mention of another raw material was by Bridgewater, who suggested methacrylate as a possible alternate for styrene. At another point in the discussion he said that du Pont had developed two or three copolymers of butadiene which they considered superior to Buna S when used for tire construction. However, as those new copolymers had been under development for only three or four years, they were too new, in Bridgewater's opinion, to be considered for immediate commercial development.

"There was some discussion about our available supply of crude rubber. The Government representatives had referred to an 18-month supply, while some of the rubber people felt that we would be able to keep going for only 8 months in case imports were cut off. This prompted Mr. Deupree to explain that the 18-month estimate was based on *very severe* reduction in private or civilian consumption to the point where the present 600,000–800,000-ton figure would be cut to about 400,000 tons/year. It also included much more extensive reclaiming. At this point Dinsmore suggested that we would be more interested in the manufacture of 100,000 tons than 40,000 tons of synthetic tire rubber. However, Mr. Deupree asked that the discussion be limited to the 40,000-ton project.

* * * * * * *

"6. The next question aroused considerable discussion regarding the advisability of building a new 40,000-ton polymerization plant as against expanding the four 2,500-ton plants to a capacity of 10,000 tons each. Semon, Dinsmore, and Bridgewater all wanted the largest possible unit. In the course of the discussion Bridgewater elaborated on the difficulties that had been experienced in enlarging the scale of operation in the case of neoprene, which is not so difficult to understand, in view of the explosive nature of acetylene and its derivatives. Semon was against dividing the 40,000 tons among four polymerization plants on the ground that the units would be too small for economic operation. He said that Goodrich considers a 100,000-ton plant the most economic unit, and Street informed me afterwards that he suspected Goodrich would be making an effort to get the entire project.

"Semon also emphasized the obstacles that had had to be overcome at each stage in Goodrich's expansion through three stages of pilot-plant operation to their present scale of operation. I felt very much tempted to say that we had experienced no such difficulty in increasing our Perbunan production through stages of 5 to 25 to 10,000 pounds per day. However, I did not consider it advisable, in view of the patent situation, to belittle the technical problems involved, and merely said that I could see no difficulty, from an engineering point of view, in expanding from a 10,000-ton plant to, say, 50,000 tons.

"In line with our discussion with Mr. Howard earlier in the day, I emphasized that to get the best technical results and the maximum value out of the project, it would be most desirable to utilize the personnel of the four big rubber companies by expanding the four 2,500-ton units to a capacity of 10,000 tons each. This would place us in the best possible position from the standpoint of experience and trained personnel to undertake any subsequent expansion to some such scale as 200,000 or 300,000 tons/year. Curme agreed with me and so did Street.

* * * * * * *

"In bringing the meeting to a conclusion, Mr. Deupree said that he saw no need of discussing patents. He considered this an emergency proposition and the Government should therefore go ahead entirely unhampered. The time to face the patent problem was when it arose in connection with the plant operation, and he thought that the Government had a record of handling matters of that kind on a fair and square basis" (exhibit 134).

In the fall of 1941 Standard and the Federal Loan Agency were in negotiation as to the royalties which should be paid Standard for use of the buna patents. On October 14, 1941, W. L. Clayton, Deputy Administrator of Federal Loan Agency, wrote Howard as follows:

Digitized by Google

"The first time you are in Washington I will appreciate it if you will phone me, as I would like to discuss further the matter of royalties on your synthetic rubber patents" (exhibit 135).

On October 24, 1941, Howard reported to Teagle and Farish as follows:

"The following extract from my diary for last Wednesday, when I was in Washington, may interest you:

"Clayton offered 1 percent royalty, which I declined. I suggested informal arbitration, with W. H. Davis as an example of an arbitrator. Mr. Clayton will have to take the matter up with Jones before deciding what to do. At luncheon Crossland suggested compromise on basis of 1 percent royalty until such time as the R. F. C. makes money on the rubber, at which time the royalty would become 3 percent. I told him I had no authority to make this suggestion without the approval of my associates, that we could not accept in principle the theory that royalties were to be paid only if the Government made money, and that I would prefer to waive royalties entirely for a preliminary experimental period, say one year, and then charge the full normal royalty of 5 percent for the first 100,000 tons, 4 percent for the second 100,000, and 3 percent for the excess over 200,000" (exhibit 136).

On October 25, 1941, Clayton wrote Howard as follows:

"DEAR MR. HOWARD: Referring to our recent conversations regarding amount of royalty to be paid by Rubber Reserve Company for the use of your patents in connection with our synthetic program:

"Our position is that this program, at present intended to provide for the production of 40,000 tons of synthetic rubber per annum, is of an experimental and educational character to prepare the ground for a much larger program in case of need. Obviously, as long as natural rubber can be obtained, we cannot hope to put this synthetic rubber into automobile tires except at a loss.

"Accordingly, it is our feeling that during this experimental and educational period, your company should be willing to accept a token royalty payment.

"If because of increased cost of natural rubber, the utilization of synthetic rubber for commercial purposes, or through any other circumstances, it becomes possible to manufacture and market the product of these synthetic rubber plants on a commercial basis at a profit, we are prepared to give careful consideration at that time to a payment of a 3 percent royalty on the use of your patents.

"I will appreciate it if you will again review this matter with your associates and let me know if the above suggestion meets with your approval" (exhibit 137).

The following unsigned memorandum dated October 27, 1941, was taken from the Standard files:

"Notes on F. A. H.'s meeting in Washington October 27, 1941:

"1. Rubber royalty matter—Clayton suggested solution as follows: No royalty first year, 1 percent second year, 3 percent thereafter, which I accepted.

"2. Crossland agreed on one year contract for butadiene, negotiations to be resumed about September 1942 for renewal. Rathbone is to finish terms of contract directly with Crossland and attorneys. Price remains 13.16 cents" (exhibit 138).

On November 10, 1941, R. R. Deupree, president of the Procter & Gamble Co. and also an official of the Office of Production Management, wrote Howard on Procter & Gamble stationery as follows:

"DEAR MR. HOWARD: I was delighted to get a note from Will Clayton saying they had come to an understanding with you in regard to a royalty on the rubber matter. *It may not mean so much in money but I think it does do the thing that I was terribly concerned with and that is to have them recognize your patents.*

"As I had a short talk with Mr. Farish about this matter, tell him I hope that this settlement seemed all right to him for, as I said before, it was the principle of the thing that I think was important, *and while this may not mean such a terrible amount of money now, it may be the means of you getting a sufficient amount in the ultimate for the work you have done in connection with rubber*" (exhibit 139).

RÉSUMÉ OF STANDARD'S STRATEGY

Standard's advocacy of a large-scale Government-financed synthetic-rubber program, which has been discussed, was part and parcel of its scheme to end up with the domination of the entire rubber industry in itself. The strategy was:

(1) to try to persuade the rubber companies to come into the big-company plan;

Digitized by Google

(2) to frighten them to come in with the threat of competition from butyl rubber, over which Standard had sole control;

(3) to force a recognition of Standard's patent position in buna as incidental to a large-scale Government program.

Firestone took the first plunge by accepting the objectionable buna license in March 1940. United States Rubber held off a couple of months but came in after Standard's public announcement of butyl rubber. Goodrich and Goodyear remained adament—refusing to take the objectionable license and refusing to be frightened in under the threat of butyl rubber.

This grand strategy was made possible by the fact that Standard had in the fall of 1939 secured apparent control of the I. G. Farben patents on buna. The original plan had been for Standard and Farben to exploit the process in unison in the United States. For this reason Goodrich and Goodyear, which had been active in experimental work on buna, never reached an understanding with I. G. Farben despite their continued negotiations with the German company in the late thirties. To facilitate the original plan, Standard turned over its butyl process to Germany in 1938 soon after its discovery. This was done on the mere promise of I. G. Farben officials that they would try to secure the consent of the German Government for the exploitation of buna in the United States. Eventually, in the summer of 1940, when Germany was at war, the patents were turned over to Jasco. Standard never received the know-how at any time. As Hopkins wrote to Howard on October 20, 1939:

"You asked about the amount of technical information available on manufacture of Buna rubber. Excepting information Mr. Murphree was able to get when he went through an I. G. plant eight years ago, the only knowledge our people have is derived from published patents" (exhibit 140–A).

Nothing more was ever secured.

In the hands of Standard, the I. G. Farben patents constituted a real threat to Goodrich and Goodyear. By 1940 these companies had achieved considerable success in their independent experimental work in producing buna, and they indicated every intention of going forward with large-scale commercial development. The fear of infringement suits by I. G. Farben had been a constant hazard to them during the late thirties, but after the commencement of the war this threat would have little restraining effect. However, with Standard's taking over the patents, the threat became more imminent and actually resulted in the institution of infringement litigation.

In the fall of 1941 Standard served notice of possible patent infringement upon Goodrich (exhibit 140–B) and Goodyear (exhibit 141). Fearing that Goodrich would beat it to the draw, Howard wrote the following memorandum to President Farish on October 3, 1941:

"Memorandum to W. S. Farish.

"Unless you have some objection, we will follow the advice of our counsel and file today in Cleveland suit on the Buna patents against Goodrich and their subsidiary, Hycar Rubber Company. To get this suit filed today, we must telephone instructions before 2 o'clock.

"There is some danger that if we delay action even a day the Goodrich company may forestall us and file suit in New York against us for declaratory judgment, alleging that we have harassed them by threatening them with suit under our patents but have failed to bring such a suit.

"We would be very much better off to be plaintiffs in Ohio rather than defendants in New York [added after Mr. Farish saw memo].

"FRANK A. HOWARD.

"P. S. Haslam, Fisher, Hopkins agree.

Note on original to Mr. Minton (exhibit 142):

"Mr. Farish O. K.'d at luncheon, October 3rd.

"F. A. H."

The suit was filed against Goodrich in the Federal district court in Cleveland. However, our entrance into the war in December 1941 resulted in a voluntary dismissal of the suit by the parties (exhibit 143).

Goodyear refused to be forced into a recognition of the superiority of Standard's patent position. The declaration of war precluded any further infringement litigation for the time being.

At the instigation of the Rubber Reserve Company (Reconstruction Finance Corporation subsidiary), Standard and the four major rubber companies entered a patent pooling arrangement with regard to buna type synthetic rubber in Decem-

Digitized by Google

ber 1941. It is important to note that in this arrangement no reference was made to butyl, which continued to remain solely in Standard's hands. Companies using Standard's buna processes were to pay a royalty of 1 percent the first 5 years and 2 percent thereafter (exhibit 144).

This royalty arrangement ended with the entry of the consent decree of March 25, 1942, which specifically made the buna licenses royalty free for the duration of the war, with reasonable royalties thereafter (exhibit 10).

PART II. BUTYL RUBBER, STANDARD AND I. G. FARBEN

The first suggestion that the new copolymer of isobutylene and butadiene—later called butyl rubber—should be discussed with I. G. Farben is found in a letter dated January 20, 1938, from P. L. Young, patent attorney for Standard Development, to F. A. Howard, president of that company. It reads as follows:

"You will recall that recently Dr. Frolich and his associates have been doing some interesting work in connection with the copolymerization of butadiene and isobutylene. The polymers are sticky, rubbery materials, which, I understand, are capable of vulcanization. The question has arisen as to whether this material comes under our Oppanol Agreement, and whether it should be disclosed to I. G.

"You will understand that this material seems to stand halfway between polyisobutylene on the one side and butadiene rubber on the other. So far as I am aware, we have no rights in I. G.'s butadiene [Buna] rubber business. That may be because they had the rights prior to our agreements, or it may be that the synthetic rubbers are not intended to come under the general fields of our agreements. It would seem to me that it would probably come under the new Chemical Process agreement.

"So far no one has discussed this development with I. G., and we have not sent them a copy of our case which was filed a few weeks ago. On the other hand, I found the other day that a letter had been sent out by one of my men with a copy to the I. G., mentioning very briefly this subject matter. There is not a sufficient disclosure to tell them a great deal about it, but it may be enough to awaken their curiosity, so that I feel you should know this as soon as possible and that perhaps you might wish to discuss the whole matter on your *next European trip*" (exhibit 144–A).

The "next European trip" mentioned in this letter was taken a month or so later. Early in March Howard cabled Development for full information concerning the copolymer [butyl] to be given to I. G. Farben. The cable itself is not available. However, its contents are sufficiently revealed in the letters which were subsequently sent. The first is a letter dated March 9, 1938, from R. P. Russell, vice president of Development, to Howard in London (exhibit 46). It refers to an attached memorandum containing full technical information concerning butyl. It also urges in forceful language that the fruits of Standard's research efforts, recognized as having great value, should not be handed over to I. G. Farben without adequate safeguards of Standard's interests. Howard's answer dated March 15, 1938, recites the rapid strides which the Germans have made in the buna development (exhibit 47). It mentions the difficulties (Hitler's prohibition orders) in the way of proceeding in the normal manner with commercial development of buna in United States. The last paragraph reads:

"In view of the very genuine spirit of cooperation which Dr. ter Meer displayed, I am convinced that it is not only the right thing to do, but the best thing from every standpoint to pass on to them full information on the copolymer at this time. I do not believe we have anything to lose by this which is comparable with the possible benefit to all of our interests."

As has been previously stated, this letter and Howard's letter to I. G. Farben of the same date forwarding the butyl information to Germany were written just 4 days after Hitler's invasion of Austria. To a nation reaching for oil and faced with the necessity of being independent of natural rubber supplies no gift could have been more timely or more welcome. That this if anything would constitute a quid pro quo which would induce Hitler to release buna for exploitation in United States was exactly the assumption upon which Howard was acting.

Before the Truman committee, President Farish read a statement containing this language:

"While the butyl rubber was recognized by us from the beginning to have commercial possibilities it had no value to Germany's self-sufficiency program

Digitized by Google

because the main raw materials for the manufacture is isobutylene which comes from oil refining and which is not in Germany in the large quantities necessary. The same thing is true for Italy.

"For the reasons stated the disclosure of the butyl rubber at its early stage of development to the I. G. in 1938 was entirely consistent with the relation of the parties and could not possibly have had any political or military implications of any kind. All exchange of information on butyl rubber was discontinued in January 1940" (exhibit 145).

But Germany has large oil refineries owned by I. G. Farben, Standard's subsidiary—D. A. P. G., Shell's subsidiary, Rhenania, and others. I. G. has been making oppanol for many years, the chief raw material being isobutylene, the same as that used in butyl rubber. The invasion of Austria opened up tremendous new oil fields. The subsequent invasion of Hungary and Rumania gave still more oil.

Mr. Parish in his statement before the Truman committee said: "In 1938 soon after Standard had discovered this product it reported it to the I. G. in the normal way pursuant to the research arrangement between the parties in the field of synthetic rubber produced from oil" (exhibit 145).

This unquestionably refers to the arrangement contemplated by the Jasco agreement of September 30, 1930. It will be worth while to examine the pertinent provision of that contract. It is article II and it reads as follows:

"As soon as either party shall have developed a new chemical process which it is then free to assign to JOINT COMPANY under the provisions of Article III hereof, it shall acquaint the other party with all technical and commercial details thereof and give the other party an option, exercisable within four months, to elect whether the process in question shall be further investigated, tested, and developed by the JOINT COMPANY. If within the said four months the other party shall elect not to request that the process be so investigated, tested, and developed by the JOINT COMPANY then the process in question shall be thereafter free of the operation of this agreement. If within the said four months the other party so requests, the JOINT COMPANY shall undertake the investigation, testing, and further development of the process, and the originating party in the first instance and the other party as well to the extent possible for it, shall be bound to assist the JOINT COMPANY in all ways in such work, and especially by providing technical and trade information and experienced technical experts for carrying on the work" (exhibit 15).

Even under the Jasco contract Standard had no justification in awaiting orders from Germany as to butyl. From the foregoing letters it is clear that Standard made full disclosure concerning butyl to I. G. Farben on March 15, 1938. According to article II of the Jasco agreement, I. G. Farben had 4 months within which to decide whether it would have the development placed in Jasco in order that its exploitation should be for the benefit of both parties.

The 4-month period had elapsed and no such desire had been expressed by I. G. Farben. E. V. Murphree, director of Esso Laboratories, wrote Howard as follows on July 28, 1938:

"The data on the properties of the various copolymer compounds indicate that this development is going to be of considerable importance. The copolymer should be considerably cheaper to manufacture than a straight butadiene or blended butadiene polymers, as represented by the Buna's compounds. *I think the copolmyer work is approaching the stage where we would like to have the assistance if possible, of some rubber manufacturer to more definitely evaluate the compounds which can be produced*" (exhibit 146).

Again on August 19, 1938, Murphree wrote Howard as follows:

"In his letter of August 1st Dr. Frolich transmitted a memorandum relative to the progress of the development work on copolymer.

"You will note that the tensile strength of copolymer has been increased up to 3,400–3,500 lbs./sq. in. Very recently examples of copolymer have been produced which, after being compounded and vulcanized, gave a tensile strength of 3,800 lbs./sq. in., which is very comparable to rubber. The copolymer appears to be superior to rubber from the following standpoints: (1) Oxidation resistance, (2) Flexing resistance, (3) Resistance to abrasion.

"Considering the rapid progress which is being made in improving the properties of the copolymer, and considering the raw materials from which it is made, it is my feeling that it represents a more promising material than the I. G. Buna, although it has not been tested nearly as thoroughly. I have written

Digitized by Google

you previously pointing out the desirability of tying up with some rubber company in order to carry this development along more rapidly. I still feel that such an arrangement is very desirable" (exhibit 147).

It was nearly 2 years after this letter before the first contract was made with a tire company as hereafter shown.

On May 5, 1939, H. W. Fisher, manager of the Standard commercial department, wrote Howard as follows:

"We are submitting herewith information for your probable discussion with Dr. ter Meer of the progress of Buna S in the United States, and the status of our copolymer rubber.

"*Dr. Frolich and I both concur in the opinion that we have reached a stage in the development of copolymer, where it would be very advantageous to be able to establish contact with one or more of the major rubber companies. Phil Young advises me and Dr. Frolich concurs that we have filed sufficient patent applications on the manufacture of the material and on the major uses so that we can feel free, from a patent point of view in presenting this material to outsiders, at least in a limited way* * * *" (exhibit 148).

STANDARD FINALLY GETS APPARENT CONSENT FROM I. G. FARBEN TO THE SUBMISSION OF STANDARD'S OWN BUTYL RUBBER TO AMERICAN RUBBER COMPANIES

Recalling that butyl rubber had not been placed in Jasco and that I. G. Farben had not exercised an option to have it placed in Jasco although 14 months had passed since its first disclosure, it is astounding that Standard should be asking for consent to submit butyl to rubber manufacturers. On June 3, 1939, ter Meer in Frankfort wrote Howard in Paris:

"I confirm our telephone conversations of May 27th and June 2nd and wish to repeat briefly what we discussed over the phone. * * * *We have, of course, no objection if you want to submit your copolymer to the rubber-goods manufacturers in the U. S. A. for experiments.*

"As soon as our experiments in Oppau are carried through *we would like to discuss the copolymer question again with you with the aim to come to an arrangement with you in this field*" (appendix 68, exhibit 149).

It will be recalled that this was nearly 14 months after Howard had delivered the butyl information to Germany.

On June 15, 1939, Howard wrote Hopkins and Fisher as follows:

"During my stay in Europe I had several telephone conversations with Dr. ter Meer and enclose a letter from him summarizing the situation as it now stands as regards Buna and copolymer. *You will note that Dr. ter Meer has no objection to our taking up the copolymer with rubber manufacturers. I have the impression that the I. G. are of the opinion that we greatly overestimate the commercial possibilities of the copolymer*, and since their experience in this field is so much wider than our own we ought to give most careful consideration to their views.

"*My own tentative conclusion is that we should delay for some two or three months longer any decision on taking the matter up with any rubber manufacturers*—but the above is expressed only tentatively and is not intended to foreclose further consideration of this question" (exhibit 150).

Having received a copy of this letter, E. V. Murphree wrote Howard on June 18, 1939:

"I do feel that the copolymer development would be very greatly accelerated by a suitable arrangement with a rubber manufacturer for determining the application of the product, and from *this standpoint wish to recommend that you reconsider the desirability of postponing for two or three months such an arrangement.* I also think it may be desirable to make an arrangement with an electric wire and cable manufacturer on the use of copolymer in this field where, at least from laboratory results, it should have real application" (exhibit 151).

On June 22, 1939, R. P. Russell, vice president of Development, wrote Howard:

"This will refer to our discussion of June 20 on the subject of copolymer. I have talked this matter over with Messrs. Fisher, Hopkins, and Murphree, and I think we are all agreed on the following: 1. *We ought to be working vigorously with a U. S. tire manufacturer to explore the possibilities of application of our various copolymers for applications in the tire business*" (exhibit 152).

The fact is that no tire company was contacted with regard to butyl until exactly 1 year after the date of ter Meer's letter of June 3, 1939, purporting to give permission.

Digitized by Google

DID I. G. FARBEN UNDERESTIMATE BUTYL'S POSSIBILITIES?

In his letter to Howard dated June 3, 1939, ter Meer said: "We agree that the copolymer may be an improved Vixtanex but we do not believe that it is sufficiently rubberlike so as to replace natural rubber in major uses" (appendix 68, exhibit 149).

Dr. P. K. Frolich, director of the Standard chemical laboratories, wrote E. V. Murphree, director of the Esso general laboratories, on June 19, 1930. This was 2 months after the invasion and dissolution of Czechoslovakia and only 10 weeks before the invasion of Poland and the beginning of World War No. 2. The letter opens as follows:

"As you know, *Dr. Beller [of Chemnyco, I. G. Farben's N. Y. representative] has been quite disturbed for some time over the I. G.'s apparent lack of interest in our copolymer.* Although he realizes that this project is still in the research and development stage, he is rather impressed by our data as they have been communicated to him regularly in our Progress Reports and through his personal contacts with our organization. It is his opinion that the I. G. in Germany do not quite appreciate the potentialities of this development. I judge it to be his personal feeling that copolymer stands a good change of being more durable for tire-tread construction than Buna S, but, even if this should not be the case, he thinks that the I. G. should be interested in it as a material that has all the earmarks of being superior to Vistanex from the standpoint of its use in electrical insulation" (exhibit 153).

The real measure of I. G. Farben's appreciation of the properties of the new copolymer is clearly indicated in one of the numerous cables which they sent in the winter and spring of 1940–41 in connection with their close supervision and control over the terms of the buna licenses which Standard proposed to give to certain of the rubber companies. On December 22, 1939, Howard had sent a cable to I. G. Farben explaining that the plan was to form a common company to handle buna but that for the time being it would be necessary to grant licenses to the rubber companies to manufacture Perbunan or Buna N (exhibit 80–B). He set out in detail the terms of the proposed license and a verbatim definition of the term "process of manufacturing defined copolymer." The definition probably would not have included the new copolymer butyl. However, it is significant that it was I. G. Farben which made certain that butyl could not possibly be considered as included in the terms of the license. Recalling that the butyl patents were taken out by Standard employees and that I. G. Farben had no title to them, it is the more significant.

On February 16, 1940, I. G. Farben sent a cable in code to Chemnyco which was duly translated and transmitted to Standard. The cable covering a page and a half of suggestions as to changes and additions to the proposed license for buna is introduced as an exhibit. One of these suggestions was the following: "Finally add after the word '6 unsaturated ethers' the words '7 unsaturated esters, *provided that said copolymers do not contain less than 30 percent by weight of polymerized diolefines of the butadiene type*'" (exhibit 80–E). Since butyl contains 20 percent or less of butadiene or other diolefin of the butadiene type it is thereby explicitly excluded from the terms of the license.

The license as drawn carried this proviso exactly as suggested. Standard's patent attorney, W. E. Currie, had also suggested a proviso of this sort but it had not been included in Howard's cabled definition to I. G. Farben. In a letter of December 11, 1939, Currie commented upon a draft form of the license agreement. He states:

"3. The butyl rubber development is intended to be excluded by the percentage limitation on amounts of polymerizable material associated with the butadiene polymer" (exhibit 154).

In the summer of 1939 Frolich wanted to send one of butyl's coinventors to Germany to aid I. G. Farben. Reference has previously been made to the letter of June 19, 1939, in which Frolich commented upon I. G. Farben's apparent underestimation of butyl.

The main purpose of this letter was to propose that one of the Standard technical men take 100 pounds of butyl and go to Germany for education of I. G. Farben as to butyl techniques and further work in its development. The last three paragraphs of the letter are as follows:

"With regard to just who would be available for such an assignment, I should think that either Mr. Lightbown or Mr. Thomas could handle the job as well as

Digitized by Google

anybody. Mr. Lightbown has the advantage of having been trained in the rubber industry. However, if we send him, we will be giving up our only rubber chemist at a time when we are about to start operation of the pilot plant and I do not consider this desirable. Mr. Thomas, on the other hand, as one of the co-inventors of the copolymer process, is thoroughly familiar with the method of manufacturing the product and with the compounding and vulcanization technique which has been developed so far. Mr. Thomas would have no difficulty in turning out as good a rubber tire tread as Mr. Lightbown has been able to develop to date; but he will not have Mr. Lightbown's past experience to draw upon in solving new compounding problems that may arise on the spot.

"As you know, we are still having some difficulty in obtaining a satisfactory bond between a copolymer tread and a rubber carcass, but Dr. Beller feels that the I. G. might be helpful in solving this problem on the basis of their past experience with making Buna treads adhere. Moreover, Dr. Beller thinks that with the equipment at Leverkusen it should be possible to build a complete tire from copolymer so as to get away from the difficulty of bonding the synthetic product to natural rubber. We have had absolutely no experience in calendering copolymer on to fabric which is an essential step in the manufacture of a complete tire, so this is something which will have to be worked out by our men in cooperation with the I. G.'s personnel, in which case we probably would have to draw more on their experience than upon our own.

"Taking everything into consideration, I should think that Mr. Thomas would be the man to go over to Germany should you wish to go ahead with such a plan. If a decision is reached on this by the end of the week, it should be possible to have everything ready for him to leave here some time between the week ends of July 16 and July 23" (exhibit 153).

Mr. Murphree did not favor this proposal. On June 22, 1939, R. P. Russell, vice president of Standard Development, wrote Howard as follows:

"This will refer to our discussion of June 20 on the subject of copolymer. I have talked this matter over with Messrs. Fisher, Hopkins, and Murphree and I think we are all agreed on the following:

"1. We ought to be working vigorously with a U. S. tire manufacturer to explore the possibilities of application of our various copolymers for applications in the tire business.

"2. U. S. Rubber would be the most desirable organization for us to work with.

* * * * * * *

"Messrs. Fisher and Hopkins are giving some thought to the kind of an arrangement which should be entered into with U. S. Rubber and will communicate their recommended outline of such a deal to you within the next few days.

"Mr. Murphree does not agree with Dr. Frolich's recommendation that Thomas go to Germany since he feels that the efforts of all our personnel are needed locally over the near future, particularly if we do tie up with U. S. Mr. Murphree feels that the question of acquainting the I. G. with our present developments can be handled by sending 50 pounds of our product to Germany together with a complete memorandum outlining the work which has been done on it and the reasons why we believe the product offers promise" (exhibit 152).

BUTYL TESTS IN THE FALL OF 1939

Early in 1939 Standard had furnished small samples of butyl (referred to as product X) and of German Buna S and Buna N to the Munitions Board for testing. In spite of the repeated urgent suggestions of subordinate officials, Howard refused to allow contacts with tire companies. However, tests and comparisons were made in Standard's own laboratory.

On October 4, 1939, Frolich wrote Russell, vice president of Standard Development as follows:

"In response to your letter of September 27, I am attaching a table giving a rough comparison of the physical and chemical properties of vulcanizates of natural rubber, copolymer [butyl], Buna S, and Buna N.

"This comparison has been worked out by Messrs. Sparks and Lightbown on the basis of the best information we have been able to obtain to date. As our data on the two Buna products are rather meager, it is not possible for us to present the comparison on a quantitative basis giving actual numerical values. Although we had hoped to obtain such information by making tests

Digitized by Google

of our own on Buna N and on the limited amount of Buna S which we have on hand, we have not found it possible to spare the time for such studies in view of the pressure of the copolymer project.

"As you know, each one of these synthetic rubbers requires its own compounding and curing technique which has to be worked out by trial and error, and therefore is rather time-consuming" (exhibit 155).

The table below shows the comparative evaluation of natural rubber, butyl, and buna rubber. The numeral 1 indicates "excellent," 2 "good," 3 "fair," and 4 "poor." A comparison makes it quite obvious that butyl excels in more respects than any of the other three types (exhibit 156).

Comparison of Vulcanizates of Copolymer, Natural Rubber, and Buna

Property	Rubber	Copolymer	Buna	
			S	N

POTENTIAL USES FOR BUTYL, 1939

Per K. Frolich, director of the chemical laboratories, prepared the following memorandum for Murphree, director of the general Esso laboratories:

"Information given to Mr. Murphree—October 17, 1939

"Question: What is the current consumption of crude rubber in (a) fields where we believe butyl rubber to have a definite advantage, and (b) where we suspect or hope that it will have an advantage; assuming in each case that butyl rubber will be available at some such cost as 30–40 cents per pound as compared with natural rubber at 15–20 cents per pound?

"Answer: Data based on 1937 and mostly 1938 figures.

Digitized by Google

Uses	Pounds per year (a)	Pounds per year (b)
Cable insulation	13,000,000	
Miscellaneous tubing	10,000,000	13,000,000
Tank car lining	(1)	
Packing, washers, gaskets	5,000,000	5,000,000
Inner tubes		100,000,000
Tire curing bags	8,000,000	
Coated fabric	5,000,000	5,000,000
Mechanical goods	50,000,000	50,000,000
Flooring	1,000,000	1,000,000
Sponge		10,000,000
Druggists sundries	5,000,000	5,000,000
Total	97,000,000	189,000,000

[1] No data.

"Mechanical goods include: Hose, belting, gloves, automobile accessories, etc.

"Where one group covers a variety of items falling in both classes, the overall figure has been split accordingly.

"Inner tubes are on the border line and a more optimistic view would be to put it in the (a) column. Even 10% of the inner tube business would amount to 10,000,000 pounds per year.

"The tire industry proper takes close to 1,000,000,000 pounds per year. The total U. S. import of crude rubber in 1937 amounted to some 1,300,000,000.

"PER K. FROLICH,
"Chemical Laboratories.

"PKF: hf
"c.c.: Messrs. E. V. Murphree, H. W. Fisher, W. J. Sparks, I. E. Lightbown."

This memorandum was noted by Hopkins October 18, 1939, the day before the conference which he, Howard, and Frolich had with the Munitions Board, referred to in part 1 (exhibit 157).

RELATIVE ADVANTAGES OF BUNA S AND BUTYL

On October 20, 1939, the day following the conference with the Munitions Board, Hopkins summarized the relative advantages of Buna S and butyl for a "rush development."

"For Buna S—

"(a) the knowledge that Germany is using the product for tires, and slight element of doubt that butyl rubber will be suitable;
"(b) the tests by U. S. tire manufacturers put the Buna S ahead of butyl rubber.[1]

"Against Buna S is—

"(a) higher cost;
"(b) raw materials more difficult to supply;
"(c) longer period of time would be required to develop the art of producing and just as long a time to develop the art of compounding for tires;
"(d) other things being equal, American development is to be preferred.

"As you know, butyl rubber is going into the pilot plant stage and plans are being made to study the Buna N process in the laboratory. This work must be carried further before it is possible to plan further ahead and make a choice between the two methods of further development. I recommend that the project continue along exactly the same lines as have now been laid out until the suitability of butyl rubber for tires can be determined. I believe, however, that the whole synthetic rubber effort could be accelerated by an increase in technical personnel to carry it along. There is undoubtedly in each department a shortage of men to advance the project as rapidly as is justified by its promising possibilities. The time is so very ripe for a replacement of natural rubber by synthetic rubber in the United States as to make the cost of such an increase insig-

[1] This statement is incomprehensible. Hopkins knew that no tire manufacturer had ever been given so much as a sample of butyl rubber. The first samples were given to tire companies in June 1940, 8 months after this letter was written.

Digitized by Google

nificant in comparison with the importance of getting on a commercial basis ahead of the others who are known to be working in the field" (exhibit 157-A).

On November 6, 1939, Howard prepared a memorandum setting forth the situation with relation to buna in the United States. The last paragraph discusses butyl and is as follows:

"Our own butyl rubber development is being pushed aggressively in our own laboratories, but without outside cooperation up to this time. *The only outside contact we have had on butyl rubber has been with the Munitions Board,* through whom we have had contact with the technicians of the Army and Navy concerning special uses of butyl rubber in munitions. There is a considerable temptation to publicize this butyl rubber development and to seek contact with the rubber companies on it immediately, but a sounder policy apparently is to confine the development to our own organization up to the point of standardized operation of our pilot plant about next January or February. *This will give us an opportunity to feel out the whole synthetic rubber situation in the United States with the du Pont Company and the four leading American rubber manufacturers through our contacts with them on the Buna matter. The additional time is also desirable from a patent standpoint*" (exhibit 158).

With reference to the Army and Navy technicians more will be said later. On January 16, 1940, I. E. Lightbown of Standard's chemical laboratories prepared a chart showing comparison of rubber and butyl rubber. It is as follows (exhibit 159):

Comparison of rubber and Butyl rubber

	Rubber	Butyl rubber
A. CHARACTER		
1. Aging	Fair	Excellent.
2. Electrical properties	Good	Do.
3. Pure gum tensile	Excellent	Do.
4. Tensile of stocks with3 carbon-black leading	do	Fair.
5. Tensile of stocks with other leadings	do	Excellent.
6. Flex resistance	Good	Do.
7. Abrasion resistance	do	Do.
8. Impermeability to gases	Fair	Do.
9. H^2O resistance	do	Do.
10. Vibration damping	Good	Superior to rubber.
11. Heat build-up	do	Doubtful, perhaps higher than rubber.
12. Acid resistance	Poor	Excellent.
13. Oil resistance	do	Poor.
14. Resistance to other solvents	Variable	Variable. (Better in bensol).
15. Elongation	About 700 to 800 percent.	About 900 to 1,000 percent.
16. Sunlight resistance	Fair	Poor unless 30 percent or more carbon black added.
17. Curing rate	Fast	Slow.
18. Compression set	Good	About same as rubber.
B. PROCESSING		
1. Time of break-down	15 to 60 minutes	None required.
2. Scorchiness. (Danger of prevulcanization.)	High in some stocks	Probably none.
3. Ease of flow in mold	Excellent	Excellent.
4. Calendering	do	Probably difficult.
5. Tubing	do	Probably fair to good.
6. Hot tear resistance	Good	Excellent.
C. GENERAL		
1. Variety of applications	Very wide	Probably as wide as for rubber.
2. Odor	Characteristic	Odorless.

The Chemical Warfare Service had contacted the Acushnet Process Co., of New Bedford, Mass., concerning the possible use of butyl, and other synthetic rubbers, for gas masks. The results of tests convinced the Acushnet people that butyl was an exceptional material and caused the letter found in exhibit 160 to be written by Philip T. Gidley, their chemical and development engineer, to Frolich on December 16, 1939. The letter sets out the factors which give butyl rubber competitive advantages over natural rubber and other synthetics and asks to be allowed to participate in a cooperative program of developing butyl.

THE THREAT OF BUTYL TO FORCE THE RUBBER COMPANIES INTO LINE ON BUNA

Negotiations with the "Big Four" rubber companies with respect to participation in a Standard-dominated synthetic rubber program, had been going on in the fall of 1939 and the following winter. In March 1940, Firestone agreed to take the buna license on substantially the terms prescribed by Standard. In reporting this fact to the executive committee in a letter dated March 7, 1940, to A. C. Minton, the secretary, Howard, stated:

"I believe we are far enough advanced with our butyl rubber development so that we could now bring this into the discussions. Although our natural course would be to hold off some time longer on any disclosure of butyl rubber.

"I should like to come to the committee on Friday morning to obtain advice on the foregoing matters. And it may be that you will wish to circulate this memorandum in advance of the meeting" (exhibit 103).

On May 7, 1940, the Acushnet Process Co. prepared an elaborate chart showing comparative properties of elastemers. Those materials tested were rubber, Perbunan (Buna N) Neoprine, butyl rubber, Thiokol and Polyvinyl chloride. There are 48 different properties with respect to which the various materials are rated. Butyl is not oil resistant and the tests involving subjection to oil, hot oil and gasoline clearly show this. Aside from those tests butyl was found to be equal to or superior to rubber in nearly every respect and on an over-all basis to be superior to the other synthetic rubbers (exhibit 161).

On May 27, 1940, Hopkins and Frolich called upon the Munitions Board and as a result of their talk, Colonel Hines of the Board wrote Howard urging tests of X product (butyl) for tires. In a letter of May 29, 1940, Hopkins reports on this conference to Howard. His letter contains these statements:

"Col. Hines said that as soon as information became available indicating that the butyl rubber was suitable for tire manufacture, he thought it quite probable that his Board would recommend that federal funds which are being made available to the President be used to advance the time when substantial quantities of butyl rubber can be produced.

"Col. Hines and Capt. Heiss explained that the interest in rubber from a national defense standpoint was not limited to the requirements of the Army and Navy. These requirements are relatively insignificant. The Board recognizes, however, that a shortage of rubber would seriously handicap industrial mobilization. A large proportion of labor goes to work in automobiles and other rubber-tired vehicles.

"Col. Hines will write to you to emphasize the importance of having the butyl rubber tested for tire purposes as quickly as possible. It is suggested that as soon as this letter is received, you call a meeting to determine what should be done" (exhibit 162).

BUTYL IS PUBLICLY ANNOUNCED

On June 3, 1940, exactly a year after ter Meer's letter of June 3, 1939, expressing willingness that Standard should contact rubber goods manufacturers for tests, Howard contacted Mr. Trainer, an official of Firestone. On June 4, 1940, Howard wrote Mr. J. W. Thomas, president of Firestone, as follows:

"*This will confirm our telephone conversation yesterday*, and my subsequent conversation with Mr. Trainer. We are looking forward with pleasure to a visit of your gentlemen with us here on Thursday. I enclose text of the statement which Mr. Farish made at the Standard Oil Company (New Jersey) stockholders' meeting today. It is difficult to tell what the newspapers will do to it, but at any rate, this is all we are responsible for. You will note that I followed Mr. Trainer's suggestion by asking Mr. Farish in this statement to refer to the existing cooperation between Firestone and ourselves.

"From the standpoint of very large production within the shortest possible time, Butyl rubber is especially important. Not only as a commercial matter, but because of its bearing on the national supply problems, we ought therefore to move as rapidly as we possibly can in the experimental application of Butyl rubber in tire manufacture. In view of this, we hope to avoid the necessity for negotiation of any formal contracts between your company and ours and proceed to cooperate on the simplest possible basis, confirmed only by letter following the visit of your people.

"I very much appreciate your prompt action in arranging for the first visit and discussion" (exhibit 163).

Digitized by Google

On June 4, 1940, W. S. Farish, president of Standard, announced butyl rubber to the stockholders and thus to the world. This announcement beat Goodrich by 1 day with its public announcement of its own synthetic rubber called Ameripol. Farish said:

"You may also be interested to know that our Standard Oil Development Company has discovered in its own research laboratories another synthetic rubber product which we call Butyl Rubber. The Butyl Rubber is made from petroleum by processes more direct and simple than those required for the production of Buna rubber, and should be appreciably lower in cost. The German product was originally produced from limestone and coal, which were the cheap raw materials for Germany, and while in our own Buna Plant now building at Baton Rouge it will be produced from oil, the process involves several steps. The Butyl Rubber is now nearly a straight petroleum product and although its manufacture involves the most advanced technology, we have solved successfully the primary production problems and already have in operation a semicommercial pilot plant at our own Esso Laboratories in Bayway.

* * * * * * *

"The Butyl Rubber has, however, special properties of its own which make it superior to natural rubber for many uses.

"As in the case of the Buna rubber, the commercial development of the Butyl rubber will be in stages, the first stage being the manufacture of relatively small quantities for the specialty market and for commercial testing in tire production. Should it become necessary for the United States to produce synthetic rubber in substitution for a major proportion of imported natural rubber, we are in a position to manufacture the Butyl Rubber from petroleum in any required quantities as rapidly as the necessary plant facilities can be installed" (exhibit 104).

Two days later Standard caused to be prepared cost compilations for Buna S and for butyl rubber. It was computed that a plant to produce 100 tons of Buna S per day would require an investment of $20,700,000 as against an investment of less than one-half that amount or $9,800,000 for the same quantity of butyl rubber. A 300-ton per day Buna S plant would require an investment of $49,600,000 as against $23,800,000 or slightly less than 48 percent as much for the same size butyl plant. The actual production cost of Buna S was computed at 16.0 cents per pound in the 100-ton day Buna S plant as against 7.5 cents per pound in the same size butyl plant. In the 300-ton day Buna S plant, the production cost would be 14.4 cents per pound as against 6.6 cents per pound in the same size butyl plant. The butyl production cost would be less than 46 percent of the Buna S cost (exhibit 163A).

On the strength of the public announcement of butyl, United States Rubber decided to come in with Standard on its synthetic rubber program. It accepted the objectionable buna license and was given the privilege also extended to Firestone, the other buna licensee, of participating in the testing of butyl.

STANDARD PUBLICIZES SOME OF THE COST FIGURES FOR THE BENEFIT OF THE RUBBER INDUSTRY

With a letter to A. L. Viles, president of the Rubber Manufacturers Association, on June 10, 1940, Hopkins sent a memorandum describing Standard's buna and butyl developments. After describing the two in rather glowing terms, he states:

"Jersey has raw material available in one location, which is believed to be the lowest cost location, to make either 500 tons per day of Butyl rubber or 300 tons per day of Buna rubber. A highly preliminary estimate of the cost of building a plant to produce 300 tons per day of Buna is $50,000,000. The corresponding cost of a plant to produce 300 tons per day of Butyl rubber is $25,000,000. In both cases these figures include the cost of plant to make the raw materials but no item to cover the cost of land upon which to construct the equipment. In each case the cost of that part of the plant for producing the raw materials is a little more than half of the total. It seems probable that substantial additional quantities could be produced in large plants at one or more other locations with an investment which is slightly higher per unit of product than the above figures. To take care of the entire rubber supply of the country it might be necessary to resort to the more expensive plants and to more expensive processes for some portion of the total production.

Digitized by Google

"An estimate has been made of the time required for the construction of either a Butyl or Buna plant. It would require 1½ to 2½ years, depending upon the quantity desired and the degree of priority of deliveries of construction materials.

"*Production costs.*—While initial operating costs may be relatively high due to lack of experience in operation on a very large scale, the production costs of Buna within a year or two after starting should not be higher than 20¢ per pound, exclusive of any return upon investment, profit, or royalty. The cost of the Butyl rubber is expected to be materially less than the cost of the Buna rubber.

"It should be emphasized that the figures used above are extremely hurried and should under no circumstances be used except as rough approximations" (exhibit 164).

As has been shown, the Munitions Board in emphatic language urged Standard to test butyl rubber for tires as quickly as possible. This was in the letter of May 27, 1940, from Colonel Hines to Howard. Attention is again called to Hopkins' letter to Howard of May 29, 1940, in which he reports the substance of the meeting with the Munitions Board which prompted Colonel Hines to write his letter of May 27. Hopkins says:

"Col. Hines and Capt. Heiss explained that the interest in rubber from a national defense standpoint was not limited to the requirements of the Army and Navy. These requirements are relatively insignificant. The Board recognizes, however, that a shortage of rubber would seriously handicap industrial mobilization. A large proportion of labor goes to work in automobiles and other rubber-tired vehicles" (exhibit 162).

On May 31, 1940, Howard replied to Colonel Hines as follows (exhibit 165):

"I acknowledge with thanks your letter of May 27.

"We are in entire agreement with your conclusions, and you may rely upon us to act at once to determine the suitability of our 'X' Product in the manufacture of tires.

"With best regards, and the hope that I shall have the pleasure of being able to report progress to you on this matter very soon, I remain

"Very truly yours,

"_____ _____."

On June 11, 1940, Howard wrote E. R. Stettinius, Jr., Chairman of the Advisory Commission to the Council for National Defense. The parts of this letter which propose a revamping of the antitrust laws to permit the type of monopoly Standard desires to create in the rubber field have already been quoted. The opening paragraphs of this letter are as follows:

"We have already furnished to you through Mr. A. L. Viles the statistical data which you have requested on synthetic-rubber production, which data we understood from Mr. Viles you were endeavoring to coordinate with all other available information for the purpose of determining the national position and policy on rubber. *Apparently we have a rather exceptional measure of responsibility in this matter* and for that reason we are supplementing the information given you through Mr. Viles with a more general statement of the synthetic-rubber problem as it appears to us.

"Our responsibility in the matter arises from the fact that we own the American rights for the German Buna synthetic rubber, that we have a second synthetic rubber of our own development, Butyl Rubber (which it seems possible may meet American conditions even better than the Buna rubber), and that some of our affiliated companies have the largest, lowest-cost supplies of raw material for the manufacture of these two rubbers and probably also for the recently announced Goodrich synthetic rubber which (according to our information) is itself a variant of the German Buna rubber" (exhibit 111).

This is a clear-cut recognition of the peculiar responsibility which Standard Oil Co. of New Jersey had with regard to the rubber (synthetic rubber) situation in this country. How this company measured up to that great responsibility is demonstrated in the following description of the tire and tube tests of butyl rubber.

STANDARD COMMENCES TIRE-TESTING PROGRAM

The two tire companies to be given samples of butyl for testing in June 1940 were Firestone and United States Rubber. These were the two companies which had accepted the objectionable form of license for buna. No other tire company ever received a sample of butyl prior to February 1942.

Digitized by Google

The tires made by these two companies from butyl were made in the period from June 1940 to November 1940. The butyl supplied for tire testing is entirely covered in the technical committee report dated April 14, 1941, pages 28 and 29 of which are found in exhibit 166. Mr. Howard testified on April 2 before the Truman committee that it required 1,000 pounds to run a satisfactory test for tires (exhibit 145). By this standard, exactly one test could have been made by each of the two companies. Each company received as much as 1,000 pounds of only one type of butyl, viz type A.

UNITED STATES RUBBER'S TIRE TESTS

Type A was the original type of butyl made of isobutylene and butadiene. From the quantity which United States Rubber Co. received for tire-testing purposes, it constructed 34 tires, only 14 of which were tested. The other 20 were used for exhibition purposes only (exhibit 167). These were found to be approximately half as good as natural rubber tires, although the tests were recognized as being unfair to the real qualities of butyl because of inadequate experience in making tires of it. Frolich reported to Hopkins on August 22, 1940, concerning these first tires:

"Dr. Gerke sounded quite optimistic concerning the possibility of making further progress. He said that they expected to be able to make improvements both with respect to tread wear and carcass life now that they had developed a basic technique for constructing tires from butyl rubber. We are supplying him with stock made with 2% piperylene which we hope will work in the direction of improved carcass life. However, I think that we will have to count on the U. S. Rubber people's experience in compounding to help improve tread wear" (exhibit 168).

No tires were made by United States Rubber of the isobutylene-piperylene stock just mentioned. On September 19, 1940, Frolich wrote Dr. W. A. Gibbons, United States Rubber Co., Passaic, N. J., concerning a new D–4 stock. This was an isobutylene-dimethylbutadiene stock. No disclosure was ever made to United States Rubber or Firestone as to the nature of the raw materials which were used in the butyl rubber which they were testing. The symbols A, B–1, B–2, C–2, and D–4 were used in all communications. Mr. Farish stated before the Truman Committee:

"Gradually through modifying the manufacturing and compounding procedure it was possible to build Butyl rubber tires which give longer service" (exhibit 145).

The fact is that less than 1 month after the report of August 22, 1940, of the tests of the first type A material, Standard had already developed two new types, C and D, each of which represented a great improvement over type A.

STANDARD IN SEPTEMBER 1940 DEVELOPED GREATLY IMPROVED BUTYL

In his letter to Gibbons of September 19, 1940, Frolich said:

"We are now ready to supply you with experimental quantities of our new D–4 stock. *This material in many respects represents such a complete departure from the butyl rubber on which you have been working that we intend to supply you with rather detailed information on its compounding, calendering and curing characteristics.* As a matter of fact, we have actually delayed sending you samples in order to give us time to accumulate more complete information on the 'D' product. We have considered it desirable to take this precaution because circumstances over which we have no control make it rather unlikely that we will be able to supply you with more than about 100 lbs. of this D–4 stock for several months to come" (exhibit 169).

On September 20, 1940, I. E. Lightbown of Esso Laboratories wrote Gibbons of United States Rubber:

"We are enclosing some of our most recent data on our new D–4 butyl rubber. I believe Dr. Frolich spoke of this in his letter of September 19. *All things considered, it looks much better for tire use than anything we have made previously.* * * * Butyl rubber Type D–4 is much better than any of the 'A' stock as a tire material" (exhibit 170).

September 23, 1940, Frolich wrote J. R. Brown, Jr., of Esso Laboratories:

"The Passaic people (U. S. Rubber) are now studying our D–4 (dimethylbutadiene stock) data, and will phone us later in the week to arrange for some of us to get together with them in order to lay out a program of work on this ma-

Digitized by Google

terial. Dr. Gerke said that it looked most interesting to them on the basis of the data which we have supplied" (exhibit 171).

From the 100 pounds of D–4 material which United States Rubber received in September 1940, it made 2 test tires. I. E. Lightbown, of Standard, reported November 19, 1940, on a visit to United States Rubber November 11, 1940. His report (exhibit 172) states that the United States Rubber people had used the same process in compounding and manufacturing the 2 tires as that employed in the 25 or 30 made previously of type A.

"They realized that the compound used is probably not the best but they did not feel that they had enough D–4 polymer to pursue the necessary compounding investigation."

In some respects these two tires were much superior to those previously made.

"Dr. Cuthbertson said that if we could make as much improvement over D–4 as we had made by D–4 over Type A he believed it to be not impossible that such a stock would be suitable for natural rubber replacement."

From a representative of a company which had at the time a $20,000,000 investment in natural rubber plantations, by far the largest of any such investment by any American rubber company, this statement is most significant. It is even more significant from a company controlled by du Pont with its rival synthetic rubber Neoprene. From November 1940 until within the last few weeks, not another tire has been made of butyl rubber by the United States Rubber Co.

FIRESTONE'S TESTS

The Firestone Tire & Rubber Co. in June and July 1940 received a quantity of type A butyl rubber for testing in tires. It made a half dozen tires of this material, chiefly to get experience in actually making the tires. I. E. Lightbown, of Standard, reported July 9, 1940, on a visit to the United States Rubber and Firestone plants. He states:

"As has been said, the Firestone Company were extremely anxious to make a representative butyl rubber tire as soon as possible. Their idea was to make a tire first, then work toward quality from this point" (exhibit 173).

Ninety pounds of C–2 material were sent to Firestone, from which three tires were made. Only two were tested on a car. September 20, 1940, J. E. Trainer, vice president of Firestone, wrote Howard:

"You will be pleased to know that we have completed the road tests on the tires made with the XC–2 polymer and that the results show a decided improvement over the tires made with the original Butyl rubber. The conditions of the test were 28 pounds inflation, 915 pounds load, 45 miles-per-hour speed on pavement and 35 miles per hour speed on gravel road. Although this polymer represents an outstanding improvement over the original Butyl rubber which we tested, there still remains much to be done" (exhibit 174).

On the same day, September 20, 1940, Lightbown sent Dr. J. N. Street, of Firestone, data on the new D–4 butyl rubber (exhibit 175). On October 2, 1940, Lightbown wrote Frolich to report on a meeting with Street September 27, 1940, with regard to their butyl rubber tire testing program:

"The Firestone Company has experienced much more satisfactory results with the C–2 than with the original butyl rubber type A stock. Under similar conditions of operation in Texas two butyl rubber tires made from type C–2 polymer lasted 2,300 miles and 4,700 miles, respectively, in comparison with 200 miles for type A stock. Dr. Street said that these tires had been sent to Texas on a 'blind' test so that direct comparison could be made without favoring either the butyl rubber or the natural rubber control. During the testing operation the unsolicited comment from Texas has been that after a day's run the tires were too hot to handle. This probably would account for their failure, which was ply separation, since the exceedingly high temperatures experienced would cause a parting between the butyl rubber and the fabric. Firestone's indoor test wheel had pretty well checked the experience of actual operation in Texas. The butyl rubber type A had failed after 66 miles on the indoor wheel at 45 m. p. h. The C–2 tire had been run at the same speed for 600 miles without any failure, although the latter tire was running at the end of the test at 170° F. for natural rubber (exhibit 176).

Although 100 pounds of D–4 material were sent Firestone prior to April 1941, no tires were ever made of that material. Standard did not urge it, basing its decision not to do so upon the failure of United States Rubber D–4 tire (exhibit

Digitized by Google

177). A few days after the decision was made Standard learned more about the United States tire failure. November 25, 1940, Frolich wrote Murphree:

"As mentioned to you over the telephone, Dr. Gerke (United States Rubber) called me this morning and said that they had called me this morning and said that they had received further details in regard to the Phoenix road test which made them feel that our D–4 stock (butyl rubber made with 4% dimethyl butadiene in the feed) could not be held responsible for its previously reported tire failure. According to Dr. Gerke this test tire failed after 2,463 miles due to "rupture" which means that it was the cotton and not the rubber that gave way. The resistance of the D–4 tread to wear was estimated to be 59% of a first-line rubber tire. Although this value should only be considered accurate to within 10% it nevertheless indicates some improvement over the original tires made from 'a' stock (butadiene copolymer) whose resistence to wear were reported as being closer to 50% or less as compared with natural rubber" (exhibit 178).

In connection with this report that it was the cotton cord which failed due to the heat and not the butyl rubber it is interesting to note the contents of this memorandum of May 3, 1940, just a few months before these tire tests. It is written by M. B. Hopkins to P. K. Frolich and is as follows:

"The following is quoted from a News Bulletin of the National Farm Chemurgic Council. I have underscored words which may be of particular interest in connection with butyl rubber.

"*80,000-Mile Tire of Rayon.*—A rayon cord tire which is 3,000 per cent sturdier than standard cotton, has a higher tensile strength than structural steel, and ran 80,000 miles under conditions which destroyed an ordinary tire in 3,000 miles was recently described at the 99th meeting of the American Chemical Society.

"William H. Bradshaw, director of rayon research for E. I. du Pont de Nemours & Co., said a new rayon developed specifically for tires has produced "astounding results" in road tests involving millions of miles.

"The secret of its strength is its *ability to maintain strength in high temperatures*, being as safe from blowouts at 105 degrees as the ordinary cotton-cord tire is at 75 degrees, according to Mr. Bradshaw" (exhibit 179).

No rayon cord tire has ever been made of butyl rubber although both Firestone and United States Rubber use rayon in all their heavy-duty tires. The difference in cost of cotton and rayon on a tire of the size 8.25–20 is only 35 cents taking cotton at 17 cents per pound and rayon at 45 cents per pound. Since less rubber (at 22.5 cents per pound) is used with rayon cords than with cotton cords, the rayon cord tire of this size actually costs 85 cents less than the cotton cord tire (exhibit 180).

When the short tire-testing program extending from August to November 1940 had been nearly completed Standard made a contract with the United Carbon Co. to develop proper carbon black for use with butyl rubber. The contract was made in November and the tire-testing program had been completed before anything came of the United Carbon Co.'s work. On April 23, 1941, Frolich wrote Murphree concerning United Carbon:

"As outlined in a previous report to you, these people are making a rather comprehensive study of the effect of various types of carbon black on butyl rubber. By and large, their observations on the physical properties of such compounds check our own. *They have recently developed a new black which seems to go particularly well with butyl.* By way of illustration, they have found that this particular material will increase the extrusion rate of butyl about 100% as compared with other commonly used blacks" (exhibit 181).

Firestone concentrated on the problem of adhering a butyl D–4 tread to a natural rubber fire carcass (exhibit 182, p. 19, from the report to the Technical Committee of Standard Development dated April 14, 1941). Nothing in the Standard files shows the results of this work. Dr. Street told this witness that they felt confident they had solved the problem.

Before the Truman committe Mr. Farish stated:

"Early efforts to make a Butyl rubber tire were discouraging. The first Butyl rubber tread vulcanized on a natural rubber carcass separated after running only 17 miles (exhibit 145).

This is a commentary on the tire-making ability of the chemists in a small chemical laboratory of an oil refinery, but is meaningless as to the actual qualities of butyl rubber. He continued:

"The rubber companies were from the beginning able to do much better than this with a tire made entirely of Butyl rubber. Their first tires ran several hundred miles before going to pieces."

Digitized by Google

But the first tire made by United States Rubber Co. of butyl rubber was still running on their mail truck after 1,600 miles, still in good condition and was removed after 4,000 miles having worn down about twice as fast as the natural rubber control (exhibit 182–A). The first tire made by Firestone was exhibited to the Standard executive committee by Howard after running 2,500 miles and then showing 10 percent more wear than natural rubber tires (exhibit 182–B). Farish continued:

"Gradually through modifying the manufacturing and compounding procedure it was possible to build Butyl rubber tires which gave longer service. At the present time the rubber companies know how to make Butyl rubber tires which will last as long as 10,000 miles when used on passenger cars which are operated at less than 35 miles per hour. It required months of work after June 1940 to arrive at this partial solution of the problem."

This sentence would seem to convey the impression that, beginning in June 1940, the rubber companies had been working continuously on a very arduous program of testing tires and making improvements as a result of the tests.

To summarize in a few sentences: In June 1940, Standard gave Firestone and United States Rubber the minimum quantity of type A butyl rubber for making tires to be tested. Firestone made a half dozen tires and United States Rubber 30 or 34, only 14 of which were tested. The conclusion reached by both was that this type of butyl would make tires roughly half as good as natural rubber. These tests had been made before the end of August 1940.

In September, Standard furnished both companies with small quantites (entirely inadequate for tire testing, according to Howard's testimony before the Truman committee) of two improved types of butyl rubber. Firestone made three tires of type C. Only two of the tires were tested on the car. They were found to represent a great improvement over those originally made of type A. Firestone never made tires of type D.

United States Rubber made two tries of type D, only one of which was tested on a car. It was found to be a great improvement over type A. United States Rubber never made tires of type C.

These tests had been completed before November 11, 1940. No tire has ever been made of butyl rubber by either company since that time, until within the last few weeks. Insofar as any actual tire-making experience is concerned, the rubber companies knew as much about making butyl-rubber tires in November 1940 as they do today. It is possible that tests made within the last few weeks, not reflected in the Standard files when examined, and not shown in the reports of the two rubber companies recently furnished the Truman committee, would shed additional light.

BUTYL INNER TUBES

In his statement before the Truman committee, Farish said:

"The rubber companies had trouble also in making Butyl rubber tire inner tubes. They had trouble adhering the valve to the tube and also with splicing the tube itself. There is promise that these problems are nearly solved" (exhibit 145).

He failed to state that as early as December 1940, Firestone was making inner tube of butyl rubber (exhibit 183) and that prior to January 21, 1941, they had found these tubes to be greatly superior to natural-rubber tubes, particularly with regard to holding air (exhibit 184).

"In two comparative tests the pressure of natural rubber inner tubes dropped from 85 to 40 lbs. 1 sq. in. while the inner tubes of Butyl rubber for the same period dropped no measurable amount in pressure."

When Mr. Farish made this statement to the committee, he must have known that Harvey S. Firestone had reported to Office of Production Management on January 9, 1942, that "butyl-rubber experimental work is rather meager because of insufficient time and quantity of materials, but in their [Firestone's] opinion the product is *satisfactory for 100 percent of tube requirements*, and possesses real advantages over any other product in this service, although there are also some disadvantages. They also report it as satisfactory and better than other products for barrage balloons and capable of being substituted for natural rubber in general on coated fabrics" (exhibit 185).

It should not be concluded that this belief in the usefulness of butyl is one only recently acquired. As early as October 1940 Firestone predicted a possible market for butyl outside of tire manufacture equivalent to 104,400 long tons of natural rubber per year (exhibit 186).

Other Testing of Butyl

The results of testing butyl by a company which was genuinely interested in ascertaining its possibilities, and in demonstrating them, are reflected in the reports of the Acushnet Process Co., of New Bedford, Mass. It will be recalled that this company had not been selected by Standard but by the Chemical Warfare Service. It became a participant in the testing of butyl and other materials for use in gas masks. It found butyl to be superior to rubber and other synthetic materials for this purpose and became enthusiastic concerning its other possibilities. At its request it was given a right to test butyl and experiment with compounding it.

On November 22, 1940, P. K. Frolich wrote Murphree as follows:

"I am attaching some notes on a telephone conversation I had with Mr. Gidley of Acushnet.

"You may find these of interest for Mr. Gidley is still the most enthusiastic booster we have for butyl rubber in the mechanical and specialty goods field" (exhibit 187).

The first part of the memorandum deals with Acushnet's experiments with butyl for gas masks. The remainder of the memorandum is as follows:

"Acushnet is carrying out extensive tests to evaluate butyl rubber for various industrial uses. One of their contracts is with a rayon company operating the Viscose process, and tests are now in progress to use our product as a surface coating material or as a material of construction in various operations that involve the handling of corrosive materials. The results to date were reported as 'very hopeful' with respect to resistance to spinning, coagulating, and rinsing solutions involving the use of hot dilute sulfuric acid, sodium sulfite, and caustic.

"There are also several places in the sulfate paper-pulp process which require resistance to corrosive chemicals but not to solvents. Acushnet is working on some of these problems. One of them includes the replacement of butyl rubber-coated steel for Hastelloy in equipment for handling a bleaching solution of high chlorine content. This test is just getting under way, but the application was said to 'look quite interesting on the basis of laboratory results.'

"The experience gained so far with the above two industries has made Mr. Gidley interested in the general subject of developing corrosion-resistant coatings. He thinks butyl rubber offers particular promise in this direction and that we might well devote some of our efforts to this field, considering 'that millions of gallons of special resistant coating materials are sold every year.' In this connection it may be mentioned that we at one time did sufficient work on a butyl rubber paint or coating composition to enable us to file a patent application along these lines.

"I also talked to Mr. Gidley about the question of adhering sheets of butyl rubber to metal. In the case of natural rubber this is quite an art, and some people, such as Goodrich with their Vulcalox process, have been rather successful in developing methods of adhering linings for tank cars and the like. Our own work on adhering butyl rubber to metal has not been particularly successful but we had understood that Acushnet had solved the problem by some modification of their standard rubber technique. It developed from our conversation that Acushnet's process depends upon a special treatment of the metal surface rather than upon the use of a bonding cement. However, they have not obtained any patent protection in this field because as a small company they have felt that they would be better off by keeping their knowledge secret. I told Mr. Gidley that under these circumstances we would prefer not to learn the details of their process as we would like to feel free to work on the problem with other rubber companies. However, I thought that it would be desirable for us to have them coat some pieces of metal for us to inspect and also to demonstrate to other interested parties. Aside from industrial uses which would be more important from the standpoint of volume, I have specifically in mind that it may be possible for us—on the basis of the results obtained in the tests carried out in cooperation with the Navy—to get butyl rubber accepted for lining of the acid-proof storage battery compartments in one or more of the new submarines" (exhibit 188).

On March 10, 1941, Hopkins wrote this memorandum to Howard and Russell:

"I believe you may be interested in reading the attached report of which Dr. Frolich did not send you a copy. Please notice particularly the marked paragraph at the bottom of page 2. The Acushnet people are attacking the problem

Digitized by Google

of utilizing butyl rubber in a much more promising way than the other cooperating companies. The General Electric and the rubber companies naturally want to use the same equipment for processing butyl rubber as is used for processing natural rubber. There is some tendency, particularly where the experiments are carried out by the operating forces as distinguished from the research people, to put butyl rubber aside in cases where it does not work in equipment designed to handle natural rubber" (exhibit 189).

The attached report is in the form of a letter from Frolich to Murphree dated March 5, 1941, and contains the following statements:

"Yesterday I had a long telephone conversation with Mr. Gidley, of the Acushnet Process Company, in order to be brought up to date on his recent activities on butyl rubber. As usual, Mr. Gidley had an interesting story to tell. Among the various companies with whom we are cooperating in this field, Acushnet is the only one that looks upon butyl rubber as an entirely new type of product and is approaching the problem of its utilization with this fact in mind.

"Due to 'Government red tape' Acushnet has not yet received a definite order for the trial lot of butyl gas-mask face blanks. However, because of the active interest in the problem on the part of General Baker and his staff, Acushnet is now going ahead with the manufacture of the masks in the hope that the order will eventually come through. As I recall it, this lot will amount to some 300 face blanks, for which we supplied 500 lbs. of butyl A quite some time ago.

"Acushnet has checked our observations on the resistance of butyl rubber to lactic acid and butterfat. Milking inflation tests are now being carried out in the field on several dozen pieces alongside of standard inflators made from natural rubber. The preliminary results were considered very satisfactory. Quoting Mr. Gidley: 'The most interesting thing about this development is that the cows seem to like the butyl inflators, * * * I knew you would laugh at this because I found it rather amusing myself when it was called to my attention. However, the fact is that butyl rubber has a peculiar feel, and its soft texture definitely results in less skin irritation.' (Apparently cows confirm the reaction of those of us who have had occasion to examine the butyl-rubber gas-mask face blanks.)

"Acushnet continues to be quite interested in the application of butyl rubber to the manufacture of druggists' sundries. Tests have been carried out on syringe bags and other articles that come in contact with disinfectants and sterilizers. In general, the butyl has been found to 'stand up much better than natural rubber' in this work. The main feature of butyl is that it does not show the characteristic tendency of natural rubber to crack on such repeated exposure to common disinfectants and sterilizers. It has also been noted that butyl seems to hold pigments without bleeding better than natural rubber. Mr. Gidley considered this a rather surprising result because it has always been taken for granted that bleeding is a characteristic of the pigment rather than of the rubber.

"The peculiar bloom of butyl rubber is objectionable for pastel colors. Mr. Gidley thought that this difficulty could be overcome if we would reduce the stearic acid content from the present 3% to 1%, or ⅓ of 1%. He felt that 1% of stearic acid should be considered about the limit for consumer rubber items, particularly when used without carbon black. Along this general line Acushnet is also working on nipples made from butyl rubber. Because of the content of pigment, i. e., zinc oxide introduced in the banburying of the stock with which they have been supplied in the past, they have not been able to meet the trade's requirement of a transparent or semi-transparent article. It was therefore agreed that we would supply Acushnet with a one-pound sample of uncompounded stock, although it would not be considered objectionable if we should prefer to introduce as much as ½ or 1% sulfur in this material as a stabilizer.

"Acushnet had approached the Navy Bureau in Washington with an offer to work on the adhesion of butyl rubber for the acid-proof lining of submarine storage-battery compartments. In return they had been requested to send in a bid for a regular submarine lining job. As Mr. Gidley felt that this was moving a bit too fast, the matter will be dropped here unless we should decide to contact the Navy in an effort to initiate a test program along such lines. (Because of the low curing temperatures ordinarily specified for this kind of a job, we are not in favor of pushing the matter further.)

"Acushnet has made considerable progress in the vulcanization of butyl rubber and has succeeded in reducing the curing time to 5 minutes at 300° F.

Digitized by Google

The product obtained has a satisfactory tensile strength and the 'permanent set is not bad—about 20%.' (This figure seems quite high to us and must refer to some special test rather than to the standard A. S. T. M. procedure.) In an attempt to speed up the cure Acushnet has devised a rather unique procedure which consists of impregnating very finely divided cotton linters or wood pulp (about 200 mesh) with calcium hypochlorite (ordinary bleaching powder) and milling this into the butyl rubber together with the regular compounding ingredients. The milling is carried out at high temperature which may contribute to the resulting fast cure" (exhibit 190).

SURVEY OF THE TESTING OF BUTYL RUBBER

The following facts stand out when one considers the testing and developing which have taken place with regard to butyl rubber. Considerable work has been done in the Esso laboratories down through the years. And yet it is the fact that the Standard Development Co. had no more than three technical employees working on this valuable development as recently as May 1941, 3 years after having given it to the Germans.

The one rubber product company which had been furnished samples of butyl (not having been selected by Standard) has been consistently enthusiastic and has accomplished more than the larger companies in mastering the art of utilizing butyl. An instance of this is found in the matter of adhering butyl to metal, a problem which continued to bother the tire companies long after Acushnet had solved it.

The two tire companies selected by Standard to test butyl for tires and tubes were those having the largest investments in natural rubber and the slightest experience and interest in working with synthetic rubber. One of the two companies, United States Rubber, is controlled by du Pont, which has its own synthetic rubber products selling under the name Neoprene, and which in recent years has been developing a new synthetic rubber which would be in competition with butyl and buna for tire and tube uses.

To summarize, Standard supplied both companies with approximately 1,000 pounds of the original type A butyl. Part of this was second-grade material and the remainder was recognized as being inferior to other types of butyl which were being developed. Each of the companies made a few tires of this material, attempting to use natural rubber technique so far as possible. The first tires were approximately half as good as natural rubber tires.

Small quantities of two improved types of butyl were supplied each company within a short time. Firestone made three tires of C–2 type material and found them to be an improvement over the original type A tires. United States Rubber made two tires out of D–4 material and found them to be an improvement over the original type A tires. The one tire made of this material actually tested on a car failed after 2,500 miles at 60 miles per hour as a result of rupture of the cotton cord and not because the butyl failed. With that tire test in November 1940 ended the testing of butyl rubber in tires.

As a result of these meager tests, United States Rubber informed Standard that tires which would give 55 to 65 percent of the service of first-line natural rubber tires if driven at speeds under 60 miles per hour could be made of butyl rubber. An important factor in the making of a tire is the carbon black used. Standard's program for developing suitable carbon black for use with butyl was not commenced until after the tire tests had ended. Although Standard and both rubber companies knew that the great problem was one of heat build-up and that rayon cords are superior in this connection no tire was made with rayon cord. Not only does the rayon itself withstand the heat far better than cotton, but it also permits the use of less rubber and in that way lessens the heat build-up.

In 1941 Standard found that a new vulcanizing agent when used with butyl rubber gives greatly improved results in laboratory tests with respect to the heat build-up in the finished product. No tire has even been made since this improvement in technique was developed, unless within the last few weeks.

One of the difficulties in connection with the whole testing program has been the unwillingness of Standard to pass on to one of the companies ideas or technique acquired from the other. As illustrative, Firestone could make good inner tubes of butyl superior to those mode of natural rubber nearly a year and a half ago and reported that fact to Standard in January 1941. United States Rubber

Digitized by Google

with all its experience and technical facilities still reports that the usable inner tube cannot be made of butyl rubber.

Standard has known for more than a year that Acushnet had quickly and successfully solved the problems of rapid vulcanization and adhering butyl to metal. There is no evidence that this knowledge was ever passed to the two rubber companies.

Firestone has recently solved the problem of making a butyl tread adhere to a natural rubber carcass. United States Rubber is still in the dark on this important phase of butyl development.

Even in connection with the buna program where Firestone and United States Rubber were both licensed to manufacture, and secrecy was not the watchword as in the case of butyl rubber, the inability to pass information from one to the other is found. In a letter of February 25, 1941, B. W. Vanderbilt of Development wrote W. E. Currie, vice president and patent attorney of Development, as follows:

"We are also constantly confronted with the problem of avoiding passing any information which we may receive from one of the companies on to the other. We believe that the possibility that such information may be passed on has made both Firestone and U. S. Rubber tend to be a little reluctant in discussing their Buna work with us" (exhibit 191).

In connection with butyl, Currie wrote Hopkins on March 24, 1941, as follows:

"Referring to your letter of March 19th, I believe the only practical way of getting advantage out of the cooperation with the rubber companies is to discuss inventions freely with them and secure advice on the filing of patent applications. *The only possible objection I see is that one of the rubber companies may feel that we are passing on to another information which should not be passed on. If we do the best we can to avoid this I should think there would be no objection to following out the procedure which you suggested in your letter of February 28th.*" (exhibit 192).

BUTYL COSTS

Standard's own computations show that butyl rubber can be made at a cost which is much lower than that of any other synthetic rubber, at approximately one-third the current cost of natural rubber.

The cost figures heretofore mentioned as having been prepared in June 1940 were discussed in the hearing before the Truman committee. Herewith is set forth every set of butyl cost figures which could be found in the Standard files. First are those in which Standard was figuring costs for itself. Later are those where the costs are being figured for the United States Government.

BUTYL COST ESTIMATES AS OF OCTOBER 20, 1939

(Exhibit 193)

10 Ton/Day Butyl Rubber Project, Bayway Summary of Investments

1. 10 T/CD Polymerization Plant, Paratone area, Total investment, on- and off-site	$800,000
2. 1.5 T/CD Butadiene Recovery and Purification Plant, Paratone area; Total investment on- and off-site	145,000
3. 30 T/CD Isobutylene Regeneration Plant, Chem. Prod. area; Supplying feed to both Polybutene and Butyl Rubber Plants; New investment only, on- and off-site	315,000
New Investment for Producing Isobutylene and Pure Gum Butyl Rubber, before Banbury treatment, storage or packaging	1,260,000
4. Product Handling Facilities, Paratone area; for Banbury treating, storing, packaging and shipping; New investment, on- and off-site	200,000
Total New Investment for Isobutylene and Butyl Rubber Projects	1,460,000
5. Existing Equipment Used for Isobutylene Absorption Unit; Dimer Plant equipment, Chem. Prods. area, used to absorb i-C_4H_8 for both Polybutene and Butyl Rubber Plants Original book value of equipment, before depreciation	[1] 240,000

[1] Polybutene and butyl rubber each take 50 percent of isobutylene produced. Consequently only 50 percent of items 3 and 5 are chargeable to butyl rubber project

10 ton/day rubber project, Bayway, summary of production costs

[Production, 7,300,000 lbs./yr., 20,000 lbs./cal. day]

	¢/lb. Pure Gum Butyl Rubber [1]	
	With 10% Deprec	Without Deprec
1. Polymerization Plant; processing cost only (incl. mfg. of C_2H_4 makeup by dehydration of C_2H_5OH, due to small-scale operation)	6.0¢	4.9¢
2. Isobutylene; fresh feed to Polym. unit. 1.23 lbs. at 2.3¢/lb. cost of production in Isobutylene Plant (charging 3.5¢ gal. for net C_4 consumed by latter)	2.8	2.1
3. Butadiene Recovery & Purification Plant/processing cost only for 1.5 T/D C_4H_6 purified, feeding mixture of polymerization plant purge gas and dilute make-up butadiene as purchased from outside: 0.15 lbs. at 9.4¢/lb. for purification	1.4	1.2
4. Butadiene Makeup, Dilute C_4H_6 (10–50%) delivered at plant for 12¢/lb. C_4H_6. Net consumption (product-losses) at 5% of product. 0.05 lb. at 12¢/lb	0.6	0.6
Production cost of washed pure gum product before Banbury treatment, storage, packaging, etc	10.8¢	8.8¢
5. Product Handling; Banbury Treatment [1] conveying, storing, packaging, and loading product	2.2	1.9
Total Production & Handling Cost for product, f. o. b. Bayway	13.0¢	10.7¢
6. Allowance for Sales & Service; to cover sales, promotion, advertising, customer service, and technical assistance	2.0	2.0
Total expense	15.0¢	12.7¢
Net realization, at price of 50¢/lb. f. o. b. Bayway, available for amortization and profit	35.0¢	37.3¢
Net Return on 7,300,000 lbs./year	$2,560,000	$2,720,000

Pay-out on Total Investment, new and existing, including 50% of Isobutylene Plant which should be charged to Polybutene rather than to Butyl Rubber, i. e., $1,460,000–$240,000=$1,700,000 — *Months* 7.5

Pay-out on New Investment chargeable to Butyl Rubber project only; i. e., $1,460,000–315,000/2=$1,300,000 — 6

[1] All costs, and sale price, assumed based on weight of pure gum butyl rubber. Cost of any materials added during Banbury treatment assumed repaid or balanced by actual weight and price billed to customer.

BUTYL COST ESTIMATES OF JUNE 4, 1940

(Exhibit 194)

Estimated cost of butyl rubber—Baytown

[Case 1–100 Ton/Day Plant—Case 1–300 Ton/Day Plant]

	Case I			Case II		
Quantities:						
Butyl Rubber Production, T/D		100			300	
Isobutylene Consumed, lbs/D		212,000			636,000	
Butadiene Consumed, lbs/D		10,000			30,000	
Normal Butane Consumed, BPD		1,550			4,650	
Investments:						
Isobutylene		$4,400,000			$10,500,000	
Butadiene		750,000			2,200,000	
Butyl Rubber		4,650,000			11,100,000	
Total incl. 25% for offsite		$9,800,000			$23,800,000	
Production cost, $/day:						
Isobutylene	at 3.1¢	$6,500	3.3¢	at 2.7¢	$17,300	2.9¢
Butadiene	at 12.2¢	1,200	0.6	at 9.2¢	2,800	0.5
Butyl Rubber		7,300	3.6		19,300	3.2
Total		$15,000	7.5¢		$39,400	6.6¢
¢/lb. butyl rubber: Increase in ¢/lb. butyl rubber for a $1/bbl. increase in normal butane			0.78¢			0.78¢

EXTRACT FROM EXECUTIVE COMMITTEE MEMORANDA AUGUST 29, 1940

(Exhibit 195)

"Mr. F. A. Howard joined the meeting and presented for inspection of the Committee the first tire made by the Firestone Tire and Rubber Company of butyl rubber—the first tire made 100% of petroleum. He said this tire had been run 2,500 miles and that it showed 10% more wear than natural rubber tires.

"Mr. Howard said that he estimated that butyl rubber would cost between 7¢ and 15¢ per pound, depending upon the method of manufacture, versus 20¢ per pound for natural rubber at this time."

BUTYL COST ESTIMATES SEPTEMBER 26, 1940

(Exhibit 196)

"DA" project

BUTYL RUBBER

[30,000 Long Tons/Annum—Butyl Rubber—Baytown]

Investment in Baytown for Butyl Rubber	$14,271,200
Butane Isomerization and Fractionation	1,233,000
Catalytic Dehydrogenation	2,385,000
Isobutylene Concentration	1,605,000
Polymerization	4,140,000
Finishing and Storage	1,270,000
Steam, Power, and Water	2,940,000
General (Office, Laboratories, Shops, Change House, Roads, and Tracks)	540,000
Land (36 acres)	7,200
Outside Facilities	151,000
Investment at Baton Rouge for C_4 Diolefin Manufacture	480,000
Diolefin Extraction	360,000
Utilities	93,000
Land (1.3 acres)	1,000
Initial Chemical Charges	26,000
Total Investment for 30,000 Long Tons/Annum	14,751,200

"ROUGH ESTIMATES OF OPERATING COSTS

"*Butyl rubber.*—11c/lb., including 5-year amortization.

"This operating cost and the DA investment cost are based upon using C diolefins extracted at Baton Rouge. If DMB is required it is approximately estimated that further investment of $500,000 will be necessary, and the Butyl rubber cost would be increased by 1c/lb.

"Of the above 11¢, the amortization amounts to approximately 4.4¢, or 2.2¢ more than normal 10-year depreciation.

"*Butadiene.*—14c/lb. at Baytown, 16c/lb. at Baton Rouge.

"The five-year amortization makes up about 6.5¢ of each of the above figures, cost with normal depreciation being approximately 3¢ less.

"Butane value is taken at 2¢ gallon in both the Butyl rubber and butadiene estimates. In the case of Baton Rouge, an additional 2¢/gallon of butane is required for shipment from Baytown to Baton Rouge."

In a memorandum of September 27, 1940, from M. B. Hopkins to Mr. H. C. Wiess, president of Humble, it is stated:

"Estimates by Jersey engineers indicate that Buna type rubbers require capital investments including raw materials which are about twice the investment for Butyl rubber, and production costs are also about twive Butyl production costs. The Goodyear and Goodrich companies have indicated that their estimates of Buna capital and operating costs are considerably lower than Jersey's corresponding estimates."

BUTYL COST ESTIMATES NOVEMBER 27, 1940

(Exhibit 197)

Preliminary estimates for Butyl rubber at Baton Rouge

Tons Rubber Per day	10	25	50
Isobutylene	$442,000	$710,000	$1,080.000
Diolefine	175,000	225,000	297,000
Polymerization	1,080,000	1,700.000	2,635,000
Banbury	303,000	460,000	730,000
Tie-ins	207,000	321,000	495,000
Total investment	2,207,000	3,416.000	5 237,000
Production cost:			
Cents per lb. ex depreciation	11.1	7.18	5.72
Cents per lb. with 10c depreciation	13.9	8.93	7.07

"Investments include labor, contractor's fee, and overhead. Figures for 25-ton plant obtained by interpolation. Value of dilute isobutylene taken as 4.61 cents per gallon. Polymerization process based on use of continuous overflow reactor. Rough figures on 5-ton plant show production cost of 17.3 cents per pound ex depreciation, 21.8 cents with depreciation."

On January 7, 1941, Howard wrote W. C. Teagle the following memorandum (exhibit 198):

"The attached memorandum dated December 20th indicates the present situation as regards sales outlets for butyl rubber. It is expected to have similar information from the Firestone Company very soon.

"On the manufacturing side, apparently our commercial development program will go in one of two directions—first, manufacture of a small quantity (2 to 5 tons per day), which may cost us say 25¢ a pound or more, or manufacture of 50 tons per day at a cost of 10¢ a pound or less.

"We will expect to reach a decision on this and start a plant as soon as the Buna rubber program is out of the way—which we expect will be before the end of this month."

An Economic Study of Butyl Rubber Production, dated February 20, 1941, by A. D. Green, contains the following data (exhibit 199):

"SUMMARY

"In Table 1 on the following page will be found a summary of the estimated new investments at Baton Route, Bayway, and Baytown for butyl rubber capacities of 5 to 50 tons per calendar day. At Baton Rouge the total cost would vary from about $1,552,000 for a 5-ton plant to $5,237,000 for a 50-ton plant, the latter capacity corresponding to the total available refinery isobutylene as indicated for the year 1942. These, and following estimated investments, are to be considered as merely preliminary and should not be used for appropriation purposes without further check. No investments are included for facilities to make additional butylenes, as might be necessary if large butadiene plants are also installed.

"For location at Bayway, the total investment is estimated as $1,423,000 for a 5-ton plant and $4,896,000 for a 42-ton plant, which is the maximum size possible taking the refinery outlook for the next few years and earmarking part of the isobutylene for Paratone and polybutene manufacture. There is a slight saving indicated for Bayway over Baton Rouge for the 5-ton and 10-ton sizes because existing isobutylene absorption equipment can be utilized, but for larger plants Baton Rouge shows a slight advantage in investment.

"At Baytown the estimated investments vary from $2,268,000 for a 10-ton unit to $5,047,000 for the maximum size plant of 50 tons. The latter shows a $190,000 saving (or 4%) over the Baton Rouge, due primarily to using equipment at the hot-acid copolymer plant. The isobutylene concentration equipment was estimated by Humble, and their design differs to some extent from the S. O. D. design for Baton Rouge. It is felt that if both designs were on the same basis, the cost difference would be decreased."

EXTRACT FROM EXECUTIVE COMMITTEE MEMORANDA

(Exhibit 200)

"March 19, 1941

"With reference to Committee memorandum of March 3, 1941, Committee reviewed, and saw no objection to, the proposal of Standard Oil Development Company to undertake, at an expenditure of approximately $25,000, necessary engineering work, including design, drafting, and listing equipment required, in

Digitized by Google

connection with the proposed construction of a ten-ton-per-day butyl-rubber plant, the location of which may be Baton Rouge. The ultimate construction cost of such a plant was estimated to be about $2,500,000, and the plant will be designed so that with an additional expenditure of $1,000,000 it could be expanded to a capacity of 20 tons per day. It was indicated that the process used for the manufacture of butyl rubber can be used for the manufacture of Vistanex and, in fact, may be a definite improvement over the present Vistanex process. The estimated manufacturing costs for butyl rubber or Vistanex on the proposed scale of production of about 10 tons per day will be approximately 16.5¢ per pound, including normal depreciation (8%). Based on an estimated realization of 30¢ per pound, this will return about 40% on the initial investment after normal depreciation.

"REQUEST FOR APPROPRIATION

"Standard Oil Company of La., $3,500,000

"*Project.*—20 Tons/day Butyl Rubber (and Vistanex) Plant.

"*Return on investment.*—On the first unit of 10 T/D ($2,500,000 Investment= 40%. On the complete unit of 20 T/D ($3,500,000 Investment=40%.

(NOTE.—It is assumed that while the production cost will be reduced on the expanded scale of 20 T/D, some reduction in sales price will, in all probability, be necessary to move this quantity. Sales price assumed on the 20 T/D scale is $0.25/lb. as compared with an approximate average of $0.20/lb. on natural rubber over the past several years.)

"*Justification.*—The justification for this project was discussed in detail with Mr. H. W. Fisher's letter of March 14 to Mr. H. L. Shoemaker, a copy of which is attached. Since that time the design of the plant has proceeded and it is now expected that, except for the polymerization step which is dependent upon some further pilot plant operation, the process design will be completed about June 1. Because of the present critical situation on procurement of materials, it will be desirable to place orders at the earliest possible date.

"Since the aforesaid letter of March 14 was written, potential markets for Vistanex have developed further and it is now very apparent that a shortage will develop before this plant can be built.

"It is proposed that the equipment for producing the raw material from refinery gases will be installed now for the full capacity of 20 T/D. This same policy would also apply to any other parts of the plant where appreciable economies could be effected by making them initially of the larger size. The polymerization and finishing equipment however would be planned for the smaller capacity of 10 T/D, recognizing the fact that before this capacity is installed it may, if the Country's supply situation on natural rubber becomes critical, be desirable to expand it to the full 20 T/D capacity.

"*Budget.*—Standard Oil Company of La., $3,500,000, additional to the 1941 approved Physical Capital Budget.

"Recommended for

"Approval:

"_____ _____."

On October 27, 1941, A. C. Minton, secretary, wrote Richardson Pratt, director, and said (exhibit 201):

"The Executive Committee this morning reviewed, and saw no objection to the following additional expenditures contemplated by the companies indicated, which it is understood will constitute additions to the adopted 1941 Capital Budgets of the respective companies:

June 11 estimated cost	Additional requirement	New total
Butyl rubber and Vistanex plant: 20-ton/day ($650,000 for increased cost of present 10 ton/day plant $1,390,000 for expansion to 20-ton/day plant) 2,500,000	$650,000 1,390,000	---------- ----------
	2,040,000 3,999,000	---------- ----------

On January 16, 1942, Howard wrote a memorandum to R. W. Gallagher, Standard Director, the first two paragraphs of which are as follows (exhibit 202):

"It is to be anticipated that during the coming week we will be asked to submit a definite proposal on the production of butyl rubber in large amounts, perhaps

Digitized by Google

up to the 120 to 150 ton per day maximum amount which we have previously indicated it would be possible to produce in our own refineries, from existing raw materials. We have furnished to the O. P. M. at their request the following data on synthetic rubber:

"Our last estimate of manufacturing costs, based on units of 20 tons per day capacity (which is the size now under construction at Baton Rouge) and which would probably duplicate for expansion of this program, is 15 cents per pound. (I told them I did not recall whether the figure of 15 cents did or did not include our normal refinery depreciations on the unit. These normal depreciations average about 6 percent.) Our estimate of investment cost for a unit of this size is approximately $4,500,000."

Butyl Cost Estimate Baton Rouge, Louisiana (Exhibit 203) February 6, 1942

Raw Material:	¢/# of Butyl Rubber
Isobutylene at 7.76¢ gal	1.70
Isoprene at 30¢/#	1.20
Operating Costs:	
Operating Labor and Supervision (Approximately 26 men/shift)	2.17
Maintenance:	
Normal	2.01
Changes and Additions	1.55
Utilities:	
Fuel-free	.46
Fuel at 12¢/MM Btu	.86
Chemicals:	
Methyl Chloride	.35
Aluminum Chloride	.30
Other chemicals	.49
Total	1.25
Other supplies	.12
Burden and Administrative and General Expenses	3.18
Containers	.71
Total, excluding Royalty, Depreciation, Profit	[1] 15.21

[1] Total profit, say $15.00.

SUPPLEMENTARY MEMORANDUM

(Exhibit 204)

Suggestion on Butyl Rubber

"The following is an estimate of the financial picture which would result from the plan outlined in Mr. F. A. Howard's memorandum of *February 12, 1942*, on Butyl Rubber—Basis 1-20 T/D unit costing $4,500,000:

Feed cost:	c/lb.
Isobutylene	1.70
Diolefin	1.00
Operating costs	12.30
Total operating costs	15.00
Technical advice & service to customers	0.50
Mutual plan expense	0.50
Total cash expense	16.00
10% Depreciation on $4,500,000	3.08
7% Profit	2.16
	21.24
Credit for repayment of loan	6.16
Interest on loan	0.62
Net realization on Butyl	14.46
Indicated operating loss to Jersey	1.54

Digitized by Google

"Assuming the proposed 3 unit plant at Baton Rouge, cost would be $13,500,000 all loaned by the Government.

"5 yrs. production—219,000,000 lbs. on which Jersey's loss is (at 1.54c lb.)—$3,372,600.

"Offsetting this loss is the fact that at the end of the contract Jersey owns the plants free and clear, plants originally costing $13,500,000 and which are 5 years old, i. e. Jersey gets plants for 25% at end of 5 years.

"There is also the possibility of additional profit through savings. If the savings amount to 2.5c/lb. and Jersey shares equally with Government, Jersey gets 1.25c/lb. or $2,737,500, reducing its investment in the 5 year old plants to only $635,100.

"Further items to be considered are that for 3-20 T/D units Jersey would have to invest:

1. Steam & Power facilities	$750,000
2. Diolefin unit	750,000
3. Laboratory facilities	100,000
	1,600,000

"The investment would be partly recovered during the contract in costs charged to the Butyl operation.

"[s] H. W. FISHER."

On January 26, 1942, Howard wrote to Howard J. Klossner, President, Rubber Reserve Company, concerning butyl rubber. He made the following statements concerning costs (exhibit 205):

"Cost estimates and contemplated sales price

"There is now being installed at the Baton Rouge refinery of the Standard Oil Co. of Louisiana the first commercial Butyl rubber plant, designed to produce 20 short tons per day of either butyl rubber or Vistanex. This plant is now scheduled for completion November 1st of this year. It has a project priority rating of A–1–B, which is not sufficient to secure any earlier completion. We estimate that, with our present state of knowledge of the process, the butyl rubber in this plant may cost about 15¢ per lb., when the plant is operated at about designed capacity and reasonably satisfactorily in all other respects. We had considered introducing this product on the commercial market at a price of approximately 27¢ per lb., and have named this price in commercial negotiations. This rather high margin over estimated cost is required by the fact that the process and equipment are now and will therefore have to pass through a period of "children's diseases" in which production may be lower than anticipated, and cost higher, and the equipment originally installed may become partly obsolete as our knowledge of the new processes involved increases.

"Investment costs and construction materials required

"Our present estimates are that a 20-ton-per-day unit, similar to the one being constructed at Baton Rouge, would cost $4,500,000. The only important quantities of critical materials employed are stainless steel, fabricated steel, ordinary electrical equipment, and rubber mills. The mills might be borrowed from existing rubber plants."

It is understood that the contracts between Standard and Rubber Reserve Company for butyl are based on cost figures totaling 22.81 cents per pound.

AVAILABILITY OF ISOBUTYLENE

Standard caused a computation to be made on January 16, 1942, showing the availability of isobutylene at major United States refineries and potential butyl rubber production. The report indicates that approximately 22,000 barrels per day of isobutylene are being produced. The estimate is 21,190 barrels per day estimated on the basis of crude-oil capacity of the major refineries and 22,420 barrels per day estimated on the basis of cracked-gasoline capacity. This would produce approximately 1,600 short tons of butyl rubber per day. The figures are 1,570 and 1,662 on the two bases just mentioned. In terms of annual production capacity this is equivalent to approximately 600,000 tons per year (exhibit 206). The memorandum prepared by George L. Ahrens stated that, "potential butyl rubber production was figured on the basis that all the estimated isobutylene production would go into rubber manufacture." For lack of

Digitized by Google

information, no attempt is made here to allow for the large expansion alkylate production which has been planned as a result of the war. The polymerization and alkylation capacities as of the beginning of 1941 are shown for each refinery to give an indication of the amount of isobutylene that might be consumed for aviation gasoline. The butyl rubber quantity assumes a 93-percent recovery of butylenes, 80-percent absorption of isobutylene, and 1.06-pound concentrated isobutylene per pound rubber (exhibits 207, 207a).

It is believed that the aviation gasoline program has been planned to take some amount between 120,000 and 150,000 barrels per day. In any event it does not seem to be a factor seriously limiting the production of butyl rubber. It is believed that the production of butyl rubber would be aided rather than limited by the present plan for large production of butadiene for buna. This is indicated in the following excerpt from a report on "Processes for the Production of Butadiene from Butylenes and Butane including Butadiene Concentration" prepared for and submitted to the technical adviser of Rubber Reserve Co. by Standard, February 12, 1934.

"Normal butane and isobutylene react somewhat more slowly than normal butylene and under the reaction conditions employed do not produce appreciable amounts of butadiene. These two compounds should, therefore, be regarded as feed stock impurities and, because of their lower reaction rate, will tend to build up in the recycle stream. In order to prevent this, a certain portion of the recycle stream must be returned to the feed stock preparation unit. While this does not present a particularly serious problem when adequate precautions are taken, it should be emphasized that the normal butane and isobutylene content of the dehydrogenation feed should be kept as low as possible" (exhibit 208).

In a letter to Howard J. Klossner, President of Rubber Reserve Company dated January 26, 1942, Howard makes the following statement relative to the possible supply of butyl:

"From raw materials available from equipment now in use and planned for immediate construction in its refineries in the United States, Standard Oil Co. (New Jersey) and affiliated companies could produce somewhere between 120 and 150 short tons per day of butyl rubber. Judging the remainder of the oil industry on a comparable basis, *raw material supplies adequate for any possible requirement would seem to be available*" (exhibit 209).

USES FOR BUTYL

Standard with its intimate knowledge of butyl's properties, and having reports from not only Firestone, but United States Rubber, Acushnet Process Co., and General Electric, in November 1940 had the following conception of the place of butyl rubber in the picture. Howard wrote Farish, November 6, 1940, "Outside of normal tires there seems to be a potential market of about 250,000 tons per annum for which butyl rubber might be suitable. *The detailed examination of this market and the effort to adapt butyl rubber to the most promising and lucrative part of it would be the field on which we would concentrate our technical work if we actually recast our program as suggested in the annexed letter.*

"*Of course from a practical standpoint we will not find any clear road and will have to ride both horses but it seems probable at this moment that we ought to shift the emphasis more strongly over into the specialty field*" (exhibit 210).

As early as June 1940 Acushnet found butyl rubber to be the most ideal synthetic for gas masks for troops (exhibit 211). A year later on June 9, 1941, Lieutenant Colonel Barker of the Chemical Warfare Service informed Dr. Frolich:

"In case we go into large-scale *civilian gas mask* production it looks like fabric laminated with thin layers of butyl, or impregnated with *butyl rubber, might be the only out*" (exhibit 212).

That a large quantity of butyl might be required for this purpose was known to Standard in May 1941 before construction on their 10-ton per day butyl plant was started.

Hopkins sent Frolich on May 28, 1941, a memorandum dated May 6, 1941, which Howard had received from Mr. Elmer Roberts, vice president of United States Rubber. It contains these statements:

"The possible use of strategic rubber raised the question of its availability. Two ounces of rubber per face piece would require 4,687 short tons for 75,000,000 masks. Some elastic head bands would also be needed for anchoring the face

Digitized by Google

pieces. This question of rubber availability is being cleared by the Sub-Committee on Civilian masks.

"The present estimate is that civilian masks may cost $2.00 each or $150,000,000 for 75,000,000 masks" (exhibit 213).

A memorandum dated February 24, 1938 in the Standard files suggested the use of butyl rubber in gas masks. This was less than a month previous to the delivery of the butyl information to the Germans (exhibit 214).

That butyl rubber and the polybutene polymers made by the same process make superior wire and cable insulation has been known to Standard for years. The developments in compounding technique to produce more rapidly extruding stock open up great fields for these materials. On January 15, 1941, R. B. Lebo gave L. B. Turner (both of Development) a memorandum indicating a total consumption of 12,000 tons of rubber in wire and cables (exhibit 215). Butyl and the other polymers made with the same process will undoubtedly be used in large quantities in this field.

One of the characteristics which has been most frequently mentioned in comparing butyl rubber with natural rubber is its low resilience. The difference in this respect has been greatly reduced by recent improvements in butyl compounding. However, for some purposes the lack of rebound is a decided advantage. For shock absorbing and vibration dampening butyl seems to have exceptional possibilities. Along this line the following memorandum of January 9, 1942, from Howard to Minton, secretary of the Standard board of directors and executive committee, is interesting.

"Mr. Elmer Roberts, vice president of U. S. Rubber Co., advises that Ordnance requirements for gun mounts, tanks, and other miscellaneous uses, aside from ordinary motor vehicle tires, have been officially estimated as of today as 50,000 tons for 1942 and 100,000 tons for 1943.

"This is almost in its entirety a new load, not reflected in the 800,000 tons consumption for 1941.

"The Ordnance Department has stated that it has funds available to finance construction of synthetic rubber plants for its own requirements as above and would be interested in receiving proposals" (exhibit 216).

It will be recalled that in October 1939 Standard officials believed butyl to have an advantage over natural rubber if the cost of the former were double that of the latter in fields totaling nearly 150,000 tons per annum. In the fall of 1940 the figure of potential use tonnage for butyl had been taken as 250,000 tons outside the tire business. Tests have indicated greater rather than less possibilities for butyl in these fields other than that of tires. When one adds 50,000 to 60,000 tons of inner tubes and the tremendous quantities of war materials such as gas masks, balloon fabric, soldiers' raincoats, paulins for airplanes, pontoons, boats, etc., the amount of butyl needed to fill the country's needs becomes enormous.

Standard commenced construction of a 10-ton-per-day butyl plant in the spring or early summer of 1941. On September 10, 1941, an unsigned memo was written which was found in the files of F. A. Howard. It reads as follows:

"F. B. Davis [of U. S. Rubber] called to discuss butyl rubber. It seems their desire to get protection against deliveries after the end of the war is dictated as much by a fear that the price of natural rubber will drop precipitantly at the end of the war as that their outlet for butyl rubber will end with the termination of the war. Apparently they expect to use at least a large part of their butyl rubber in tubes. It is up to us to find some way to make them a proposal which will give them reasonable protection against paying too high a differential over natural rubber for their butyl rubber after the war. If we find a solution of this problem, they seem prepared to make twenty or thirty-million pounds per annum of butyl rubber, beginning as soon as they can get it" (exhibit 217).

In October 1941, Standard decided to change the capacity of the butyl plant to 20 tons per day. In February 1942, the plans were changed at the request of the Rubber Reserve Company to provide for a capacity of 20,000 tons per annum. More recently new arrangements have been made for a total production capacity of 60,000 tons per annum.

PART III. A PATTERN OF DECEPTION

Reference has previously been made to the letter of E. M. Clark, vice president of Standard, to Dr. Carl Kruch, of I. G. Farben, dated April 30, 1930, which urged I. G. Farben to protect its patent situation as against du Pont (exhibit 14).

Digitized by Google

information, no attempt is made here to allow for the large expansion alkylate production which has been planned as a result of the war. The polymerization and alkylation capacities as of the beginning of 1941 are shown for each refinery to give an indication of the amount of isobutylene that might be consumed for aviation gasoline. The butyl rubber quantity assumes a 93-percent recovery of butylenes, 80-percent absorption of isobutylene, and 1.06-pound concentrated isobutylene per pound rubber (exhibits 207, 207a).

It is believed that the aviation gasoline program has been planned to take some amount between 120,000 and 150,000 barrels per day. In any event it does not seem to be a factor seriously limiting the production of butyl rubber. It is believed that the production of butyl rubber would be aided rather than limited by the present plan for large production of butadiene for buna. This is indicated in the following excerpt from a report on "Processes for the Production of Butadiene from Butylenes and Butane including Butadiene Concentration" prepared for and submitted to the technical adviser of Rubber Reserve Co. by Standard, February 12, 1934.

"Normal butane and isobutylene react somewhat more slowly than normal butylene and under the reaction conditions employed do not produce appreciable amounts of butadiene. These two compounds should, therefore, be regarded as feed stock impurities and, because of their lower reaction rate, will tend to build up in the recycle stream. In order to prevent this, a certain portion of the recycle stream must be returned to the feed stock preparation unit. While this does not present a particularly serious problem when adequate precautions are taken, it should be emphasized that the normal butane and isobutylene content of the dehydrogenation feed should be kept as low as possible" (exhibit 208).

In a letter to Howard J. Klossner, President of Rubber Reserve Company dated January 26, 1942, Howard makes the following statement relative to the possible supply of butyl:

"From raw materials available from equipment now in use and planned for immediate construction in its refineries in the United States, Standard Oil Co. (New Jersey) and affiliated companies could produce somewhere between 120 and 150 short tons per day of butyl rubber. Judging the remainder of the oil industry on a comparable basis, *raw material supplies adequate for any possible requirement would seem to be available*" (exhibit 209).

USES FOR BUTYL

Standard with its intimate knowledge of butyl's properties, and having reports from not only Firestone, but United States Rubber, Acushnet Process Co., and General Electric, in November 1940 had the following conception of the place of butyl rubber in the picture. Howard wrote Farish, November 6, 1940, "Outside of normal tires there seems to be a potential market of about 250,000 tons per annum for which butyl rubber might be suitable. *The detailed examination of this market and the effort to adapt butyl rubber to the most promising and lucrative part of it would be the field on which we would concentrate our technical work if we actually recast our program as suggested in the annexed letter.*

"*Of course from a practical standpoint we will not find any clear road and will have to ride both horses but it seems probable at this moment that we ought to shift the emphasis more strongly over into the specialty field*" (exhibit 210).

As early as June 1940 Acushnet found butyl rubber to be the most ideal synthetic for gas masks for troops (exhibit 211). A year later on June 9, 1941, Lieutenant Colonel Barker of the Chemical Warfare Service informed Dr. Frolich:

"In case we go into large-scale *civilian gas mask* production it looks like fabric laminated with thin layers of butyl, or impregnated with *butyl rubber, might be the only out*" (exhibit 212).

That a large quantity of butyl might be required for this purpose was known to Standard in May 1941 before construction on their 10-ton per day butyl plant was started.

Hopkins sent Frolich on May 28, 1941, a memorandum dated May 6, 1941, which Howard had received from Mr. Elmer Roberts, vice president of United States Rubber. It contains these statements:

"The possible use of strategic rubber raised the question of its availability. Two ounces of rubber per face piece would require 4,687 short tons for 75,000,000 masks. Some elastic head bands would also be needed for anchoring the face

Digitized by Google

pieces. This question of rubber availability is being cleared by the Sub-Committee on Civilian masks.

"The present estimate is that civilian masks may cost $2.00 each or $150,000,000 for 75,000,000 masks" (exhibit 213).

A memorandum dated February 24, 1938 in the Standard files suggested the use of butyl rubber in gas masks. This was less than a month previous to the delivery of the butyl information to the Germans (exhibit 214).

That butyl rubber and the polybutene polymers made by the same process make superior wire and cable insulation has been known to Standard for years. The developments in compounding technique to produce more rapidly extruding stock open up great fields for these materials. On January 15, 1941, R. B. Lebo gave L. B. Turner (both of Development) a memorandum indicating a total consumption of 12,000 tons of rubber in wire and cables (exhibit 215). Butyl and the other polymers made with the same process will undoubtedly be used in large quantities in this field.

One of the characteristics which has been most frequently mentioned in comparing butyl rubber with natural rubber is its low resilience. The difference in this respect has been greatly reduced by recent improvements in butyl compounding. However, for some purposes the lack of rebound is a decided advantage. For shock absorbing and vibration dampening butyl seems to have exceptional possibilities. Along this line the following memorandum of January 9, 1942, from Howard to Minton, secretary of the Standard board of directors and executive committee, is interesting.

"Mr. Elmer Roberts, vice president of U. S. Rubber Co., advises that Ordnance requirements for gun mounts, tanks, and other miscellaneous uses, aside from ordinary motor vehicle tires, have been officially estimated as of today as 50,000 tons for 1942 and 100,000 tons for 1943.

"This is almost in its entirety a new load, not reflected in the 800,000 tons consumption for 1941.

"The Ordnance Department has stated that it has funds available to finance construction of synthetic rubber plants for its own requirements as above and would be interested in receiving proposals" (exhibit 216).

It will be recalled that in October 1939 Standard officials believed butyl to have an advantage over natural rubber if the cost of the former were double that of the latter in fields totaling nearly 150,000 tons per annum. In the fall of 1940 the figure of potential use tonnage for butyl had been taken as 250,000 tons outside the tire business. Tests have indicated greater rather than less possibilities for butyl in these fields other than that of tires. When one adds 50,000 to 60,000 tons of inner tubes and the tremendous quantities of war materials such as gas masks, balloon fabric, soldiers' raincoats, paulins for airplanes, pontoons, boats, etc., the amount of butyl needed to fill the country's needs becomes enormous.

Standard commenced construction of a 10-ton-per-day butyl plant in the spring or early summer of 1941. On September 10, 1941, an unsigned memo was written which was found in the files of F. A. Howard. It reads as follows:

"F. B. Davis [of U. S. Rubber] called to discuss butyl rubber. It seems their desire to get protection against deliveries after the end of the war is dictated as much by a fear that the price of natural rubber will drop precipitantly at the end of the war as that their outlet for butyl rubber will end with the termination of the war. Apparently they expect to use at least a large part of their butyl rubber in tubes. It is up to us to find some way to make them a proposal which will give them reasonable protection against paying too high a differential over natural rubber for their butyl rubber after the war. If we find a solution of this problem, they seem prepared to make twenty or thirty-million pounds per annum of butyl rubber, beginning as soon as they can get it" (exhibit 217).

In October 1941, Standard decided to change the capacity of the butyl plant to 20 tons per day. In February 1942, the plans were changed at the request of the Rubber Reserve Company to provide for a capacity of 20,000 tons per annum. More recently new arrangements have been made for a total production capacity of 60,000 tons per annum.

PART III. A PATTERN OF DECEPTION

Reference has previously been made to the letter of E. M. Clark, vice president of Standard, to Dr. Carl Kruch, of I. G. Farben, dated April 30, 1930, which urged I. G. Farben to protect its patent situation as against du Pont (exhibit 14).

Digitized by Google

Ten years later Standard was still playing the game of aiding I. G. Farben and seeking to prevent American companies from acquiring an advantageous patent position in the field of synthetic rubber. On March 1, 1940, Hopkins wrote to Dr. H. Beller, of Chemnyco, I. G. Farben's New York representative, as follows:

"Thank you for your courtesy in sending us Dr. Semon's letter of February 20th with your letter of February 28th. We see no objection to your replying to Dr. Semon in accordance with the draft of letter which you sent us, nor to your plan to obtain the desired information from the I. G. We would, however, appreciate your letting us see the information you may obtain before it goes to the Goodrich Company.

"It is our understanding that the Goodrich Company has been spending considerable effort in the development of processes for making natural rubber and other rubber-like materials adhere to metal surfaces. It is therefore quite possible that the information you are able to obtain will be helpful to Goodrich not only in connection with Buna but in other connections, including the building of a patent position in the field of rubber adhesion to metal.

"Thanking you for sending us the correspondence, I am" (exhibit 218).

Following this advice from Standard, Beller wrote Dr. W. L. Semon, of Goodrich, on March 4, 1940, as follows:

"We wish to acknowledge receipt of your letter of February 20, 1940, concerning the development of Buna rubbers for lining metal tanks.

"The information we have in our files relating to the use of Buna in this field is rather limited and antiquated, so that a discussion of your questions would be of little value at the present time. We shall be glad, however, to get in touch with our friends and try to secure the information regarding the economical and technical possibilities of Buna linings, in which you are interested.

"We thank you for your inquiry and shall notify you as soon as the information which you desire becomes available" (exhibit 219).

No further communication on the subject was found in Hopkins' files, and it seems safe to assume that I. G. Farben thus cautioned by Standard never gave to Goodrich the desired information. Goodrich could easily verify or contradict this assumption.

It should be noted that this interchange between Standard and I. G.'s representative took place 6 months after I. G. was supposed to have withdrawn completely from the buna rubber development in United States and after Standard had been asked by the Munitions Board in October and November 1939 to aid in the largest possible development of synthetic rubber in this country. That Standard was interested in building a patent position in this field is indicated by the letter of Robert E. Ellis of its aviation department to Goodyear April 30, 1940:

"This company is interested in securing as much information as possible concerning the use of synthetic rubber in airplane fuel tanks. It is believed that there are a number of different type tanks used; some where the rubber material is simply used as a lining to prevent leakage; others where the rubber material is used inside the wing so that the tank may take the shape of the wing camber and fit snugly into the wing structure.

"It is understood also that there are some patents in connection with the use of synthetic rubber in fuel tanks. Would it be possible for you to give this company as much information as you can concerning the use of synthetic rubber in your fuel tanks? Particularly, if you have any patents on this subject, could you give us references to them?

"We should like to know also how these tanks compare with the conventional aluminum ones with respect to weight, costs, and service.

"Any information on this subject will be greatly appreciated" (exhibit 220).

* * * * * * *

In the projected American tour of the I. G. Farben representative in the fall of 1938 consideration was given as to how the synthetic rubber program should be presented to "outside interests in the United States," Howard wrote Farish on November 18, 1938:

"Mr. ter Meer, of the I. G. Farbenindustrie, will arrive in New York on Thanksgiving Day and will be accompanied by Dr. Muller-Cunradi. Dr. ter Meer must sail from here the 16th of December.

"During their stay they wish to review the entire situation in connection with the establishment of a synthetic rubber industry in the U. S., which will involve (1) a study of the available hydrocarbon gases and a comparison of data on processing costs, which will be made by Dr. Muller-Cunradi jointly with our

Digitized by Google

technical people, and (2) a review of the economic and financial aspects of the project. In this last connection, Dr. ter Meer believes it will be desirable to consult with the heads of all the principal rubber companies.

"The question which should be settled at the outset is whether, in the discussions with outside interests in the U. S., it is desirable that Dr. ter Meer should present the matter as an I. G. project, identifying Jersey only as a probable cooperator and supplier of raw materials, or whether it is in the interests of both parties that the matter should be presented from the outset as a project which, if undertaken in America, will be a primarily American project, sponsored by Jersey, but of course based upon the German I. G. technical foundation.

"Not being able to see clearly just how the matter would proceed practically in the U. S., or what would be in the interests of the parties, we have, in the few discussions with outsiders which have been held to date in the U. S., straddled the above issue, but it would appear that we shall have to give a little more definite indication of our position in the matter if we are to make very much headway during Mr. ter Meer's present visit.

"My present opinion is that it is probably desirable, without making any definite statements on the subject, to conduct the discussions in the U. S. in all cases jointly with Dr. ter Meer and under such conditions as to give the definite impression that Jersey is taking a leading part in developing the situation here" (appendix 13, exhibit 61).

* * * * * * *

In view of the clearly expressed desire of the Munitions Board to have Standard aid in the quickest possible development of synthetic tires in this country, Standard's method of dealing with the situation is interesting to say the least. Howard wrote F. H. Bedford, Jr., of Atlas, the Standard tire subsidiary, on April 10, 1940, as follows:

"My guess is that enough Buna could be available to permit introducing a small number of premium tires on the market about the end of the present year. We certainly would not be able to meet the demand if it grew rapidly, but from the standpoint of our primary objective in introducing such a tire (which would be to gain prestige) the fact that the supply would be so limited that the tires would have to be rationed for some time would simply make people more anxious to get them, and would create more publicity" (exhibit 221).

In the memoradum of November 16, 1929, which was referred to earlier in this statement, Howard states:

"It would probably not be lawful to license the Buna rubber on condition that the butadiene supplies be purchased from us. It might be possible for us to license on condition that each licensee cross-license us under his own improvements but not require the licensee to pass such a cross-license through us to other licensees. If this proved possible, the effect would be that we should have the right (and would be the only company to have a right) to operate under all the Buna N basic and improvement patents of all manufacturers. This might possibly be of value to us but we could only capitalize it by actually engaging in the business ourselves. If we want to do this, it would be better to do it at the outset" (appendix 37, exhibit 91).

This attempt to get the rubber companies into a license arrangement which would result in a continually increasing dominance of Standard was partially successful. As has been stated, it has only failed of consummation by reason of the refusal of Goodrich and Goodyear to become parties, the outbreak of the war, the antitrust prosecution, and consent decree.

L. B. Sebrell of Goodyear stated in his July 19, 1939, report of a conference with Hopkins on July 17, 1939, that—

"The Standard Oil Company propose to set forth the complete details of their butyl rubber in a general paper to be given at the American Chemical Society Meeting in Detroit the week of September 9 * * * They think the butyl rubber will be much more worthwhile than the Buna type rubber and believe that the Government will be much more interested in it than in work on regular Buna. Their position, as Hopkins sees it, is that if there is an emergency they are willing to contribute their patents to the Government, if all others are requested to do likewise, and leave it to an impartial judge to determine what compensation they should receive for their contribution. In the meantime, they see no other alternative but for each company to pursue its own respective course. They are strongly in favor, however, of a large cooperating plant, and it appears that they have urged the Government to take this view of the situation, that a

Digitized by Google

national emergency does now exist, and that such a large-scale plant ought to be built. Of course, this is in line with Mr. Howard's previous thoughts" (exhibit 222).

About 3 weeks later the following entry appears in the Standard executive committee memoranda of August 6, 1940.

"Mr. Howard advised of receipt of a telegram from Mr. Clarence Francis of the National Defense Advisory Commission confirming the meeting to be held in Washington on August 7 to consider all necessary steps to provide total capacity for synthetic rubber of 100,000 tons per annum, and suggested methods of insuring a market for this quantity. The telegram advised, also, that the industry will be asked to engineer, at its own expense, plants which represent the practical commercial units fitting into the program, making whatever arrangements necessary for raw materials. Plants to be engineered should be in general accord with a fesaible program for our interests alone or in cooperation with others. No definite commitments will be asked for at this time with respect to plant construction.

"Mr. Howard said it would be his preference that we not invest any considerable sums in the manufacture of buna rubber, but give such aid and advice as might be helpful. He preferred, in view of the greater possibilities of our interests' butyl rubber, to advise the Committee that we are considering building a plant to manufacture 10,000 tons per annum of butyl rubber, but that if the Government would be interested in giving protection to the extent of 5¢ per pound to the whole rubber field, our interests might be willing to construct a plant to manufacture up to 30,000 tons of butyl rubber per annum on a five-year contract basis" (exhibit 117).

Standard was willing to discuss butyl's superiority in an endeavor to induce Goodyear to fall in line with Standard's one-big-company plan. It was unwilliing to carry through on the threat and actually disclose to Government agencies the real facts concerning butyl rubber. Its exceptional cheapness of cost was never disclosed to any Government agency until the Antitrust Division took the documents from the Standard files in February 1942.

The offer which was made by Standard in offering to build a 30,000-ton butyl plant was shown to be merely a gesture. The offer with withdrawn in October 1940 before the so-called tire-testing program was well under way and before there was any report from either tire company as to the improved types of butyl (exhibits 119, 120, and 121).

In his statement to the Truman committee, Farish refers to the reduction of the Government synthetic rubber program to a mere shadow plant program in the winter of 1941. He failed to disclose Standard's participation in the scheme to bring about this reduction (exhibits 122, 123, and 124).

On February 27, 1941, A. C. Minton, secretary, wrote Howard as follows:

"With reference to your memorandum to me under date of February 24, this will confirm that the Executive Committee on February 25 saw no objection to the following proposals:

"(1) That our interests indicate to Firestone Tire and Rubber Company and United States Rubber Company that they would be willing to supply their requirements of butadiene if they were successful in inducing the Reconstruction Finance Corporation to substitute a 2,500-ton synthetic rubber plant for the 10,000-ton-per-annum rubber plant envisaged in earlier discussions on this subject * * *" (exhibit 223).

On October 17, 1939, Frolich wrote Murphree to tell him that the Navy Department's Bureau of Construction and Repair was particularly interested in perbunan (Buna N) and also in butyl rubber.

"In discussing this matter, the Navy Department registers surprise on having learned that appreciable quantities of buna rubber had been imported from Germany, and had been made available to various rubber-manufacturing concerns. This is the first point on which I need some help. Although it is my understanding that perbunan originally was imported in this country in competition with neoprene, I know nothing about the arrangement under which Buna S was made available to some of the tire manufacturers, or what part our company has taken in this test program.

"It is also pointed out that before extensive additional investigations are undertaken by the Navy Department, it is desirable to know the extent to which the commercial status of these three types of rubber has been altered through the present state of European affairs. Information is specifically requested as to whether we have actually gone into production of Perbunan and butyl rubber. This is the second question that I will have some difficulty in answering. Although I presume that I am to continue to be absolutely frank in regard to our

Digitized by Google

present and contemplated future activities in the field of butyl rubber I have no idea what to tell them about our policy in regard to Perbunan.

"I expect to be in New York tomorrow at noon, and I am wondering whether it might not be possible for us to settle the answers to these questions with Mr. Howard at that time, so that I may at least send a tentative reply to the Navy Department" (exhibit 224).

A startling example of the lack of absolute frankness in regard to butyl rubber is found recorded in a letter from Frolich to Hopkins dated November 21, 1939. It should be remembered that this was immediately after a meeting with the Army and Navy Munitions Board at which the Standard officials were made to understand that the Board was vitally interested in all the synthetic rubber possibilities. It was a year and a half after Frolich had prepared and Howard had given to the German I. G. Farben complete and detailed information concerning butyl. It was 5 months after Frolich had recommended that one of the co-discoverers of butyl rubber be sent to German to educate I. G. Farben on the valuable properties of butyl. With these facts in mind, this letter of November 21, 1939, by Frolich, director of the chemical division of Esso Laboratories, is rather surprising.

"Some time ago we received a rather detailed report on the preliminary work carried out by the Navy's Mare Island laboratories on the evaluation of the three synthetic rubbers submitted to them, i. e., Buna S, perbunan, and butyl rubber. Last week, Mr. Werkenthin, of the Navy's Bureau of Construction and Repair in Washington, spent the day with us here at Bayway to discuss the Mare Island laboratories' results, and to get some first-hand information on the compounding and general handling of these synthetic rubbers.

"Mr. Werkenthin was particularly interested in ascertaining how far we had proceeded in the development of butyl rubber. He seemed rather favorably impressed by the properties of this product as brought out by the movie and with the work in general, but perhaps he was somewhat disappointed to find that we are not closer to commercial production as he seems to be particularly impressed by the properties of butyl rubber.

"Because of the possible application of butyl rubber to some of the Navy's requirements, Mr. Werkenthin had been instructed also to look into the manufacturing process. You will recall that I took up this question with you before his arrival. As agreed upon, I took Mr. Werkenthin over to the "K" plant when it appeared that I could not very well steer his interest away from the process. However, I am quite certain that he left with no picture of the operations other than that a considerable amount of distillation and refrigeration is involved in the handling of the light hydrocarbons, and that refinery gas rather than straight butadiene is the raw material" (exhibit 225).

* * * * * * *

In his conference with Goodrich officials on November 10, 1939 Hopkins stated that tire rubber (Buna S) could not be produced unless "subsidized by the Government or someone with a free purse" (appendix 31, exhibit 85). This statement was made when the knowledge was fresh in his mind that Goodrich itself would be very much interested in participating in a large unsubsidized development of Buna S if it could be made for 25 cents a pound; and the further knowledge that it could be produced at 25 cents a pound with a very substantial return on the capital invested.

When Howard and Hopkins had a conference with the Army and Navy Munitions Board on the afternoon of November 15, 1939, they knew that the major rubber companies were interested in participating in a buna-rubber program for tires. Hopkins knew the facts because he had talked with officials of the various rubber companies the preceding week. Howard knew the facts as they were set forth in Hopkins' letters to him. The following excerpts make this clear. In his letter of November 13, 1939, Hopkins told Howard of his conference with the Firestone people at Akron, Ohio on November 10, 1939. He stated:

"Firestone is receptive to any suggestions as to how they can use synthetic rubbers but they are not taking the initiative. They have concluded that Buna S will make tires at least as good as natural rubber tires and perhaps with 10% better wear. * * * Firestone wishes to participate in any national plan to protect rubber supplies with synthetic material in case of emergency" (appendix 32, exhibit 86).

In his letter of November 13, 1939, concerning his conference with Goodrich officials Hopkins told Howard:

"With regard to Buna S, Goodrich finds it as good as or a little better than natural rubber. At a competitive price, they would be quite willing to use it to

Digitized by Google

replace natural rubber. They consider that production of at least 100 tons per day in the United States would be necessary to make it practical commercially from the standpoint of rubber companies taking hold * * *

"The most important point made by Goodrich in favor of independent production by the different rubber companies is that the immediate supply problem could be best met if it were not necessary to take the time to get all of the companies working together" (appendix 30, exhibit 84).

In his letter of November 15, 1939, Hopkins told Howard of his conference with U. S. Rubber Co. officials on November 14, and said:

"U. S. Rubber has not done as much with synthetic rubbers as Goodyear and Goodrich. * * * Without waiting for the results of the tire tests they feel fairly certain that Buna S would be a very good substitute for rubber if it could be produced at a satisfactory price. * * * With regard to Washington's interest in a rubber supply, Mr. Roberts [Vice President of U. S. Rubber] did not feel, from what he knew of the situation, that anything should be done at this time by the government in the way of encouraging synthetic rubber by subsidy. * * * In fact, the whole position of the company regarding the Buna development may be summarized by stating that their only concern seems to be that competitors may get a head start in the synthetic rubber field" (appendix 33, exhibit 87).

(The conferences with Goodyear and Goodrich did not take place until November 21.) Nevertheless, the presentation of the situation by Howard and Hopkins to the members of the Munitions Board was such that Major Browne reported the conference, using the following language:

"This company [Standard] cannot afford to develop Buna S on a large scale, since there is little or no commercial market. * * * No company wants to pioneer the development of Buna S on such a large scale that would be necessary to make the United States self-sufficient in respect to rubber—peacetime competition with natural rubber prevents, and the resultant financial burden is too much. * * *

"It was indicated that these companies [the 4 majors, du Pont, and Röhm & Haas] would probably be pleased to acquire the license for Buna N but would react unfavorably to the proviso [in the proposed license] requiring the development of Buna S. A Government subsidy, guarantee, or some sort of outlet for tires fabricated from Buna S would help carry the burden and ameliorate this restrictive contractual clause" (appendix 38, exhibit 92).

Howard in his memorandum of November 17, 1939, shows that the impression conveyed by Major Browne's report was a justifiable interpretation of what Howard and Hopkins had said. He states in this memorandum:

"None of the rubber companies desire to invest in commercial production of Buna S at this time" (appendix 37, exhibit 91).

On November 22, 1939, Howard wrote Colonel Hines, of the Munitions Board, and appended a short memorandum of corrections to Major Browne's report dated November 16, 1939. In this memo he states:

"It is hardly fair to say that the rubber companies would 'react unfavorably' to the development of Buna S for tire purposes" (appendix 39, exhibit 93).

He proceeds to state the matter in other words which seem to have substantially the same meaning.

"They certainly all have a real interest in this possibility, and a large amount of work would undoubtedly be accomplished voluntarily. On the other hand, it would not be easy to get definite commitments to persevere in such work on a substantial scale unless some means of compensation, direct or indirect, were involved in the arrangement. At the present moment the business interest of the rubber companies and the national interest run parallel, because the rubber companies still have a hope that, considering all questions of quality and cost, the synthetic product might be an economic competitor of the natural product. The national interest is not so definitely limited, however, and would remain active and important, even though it should be apparent that the synthetic product could not compete on an even basis. The problem is further complicated, however, by the fact that the natural rubber market is not a free market but is subject to control by foreign governments and cartels. A definite program which could be relied upon from the national defense and national economic standpoint therefore has to be based upon some set-up which will function whether or not the immediate commercial interest of the rubber companies remains active" (appendix 39, exhibit 93).

Digitized by Google

In the memorandum written for R. R. Deupree of the Office of Production Management handed to him in Mr. Teagle's office on March 28, 1941, and which he was asked to destroy after reading, Howard stated:

"Our honest opinion is that no one of these four largest companies is, in any important respect, sufficiently more advanced in the Buna field than the others, to justify more favored treatment than the others receive.

"The Firestone and U. S. Rubber companies have accepted a license from us for the Buna process, and this same license has been offered both to Goodyear and to Goodrich and is still open to them to accept" (exhibit 226).

He did not mention to Deupree the feature which was in the original license agreement form and which was never removed i. e., the requirement that the licensee should make available to the licensor (Standard) all its own patents and future improvements, thus building up Standard's dominating position.

In view of his statement that "no one of these four largest companies is in any important respect sufficiently more advanced than the others, etc." the language found in a memorandum signed by W. L. Semon of Goodrich is interesting. It is dated April 15, 1940, and reports a conference between Goodrich and Standard representatives in New York. The second paragraph begins:

"Mr. Howard said that Goodrich had probably advanced further in the field than any other rubber company.

* * * * * * *

"Mr. Howard admitted that S. O. D. needed Goodrich knowledge and experience in the field.

* * * * * * *

"S. O. is looking forward to developing a large centralized production of synthetic rubber. They do not wish to grant any licenses which will conflict with this larger objective.

* * * * * * *

"They believe that the rubber should carry, say, a 10% royalty. Half of this without question should go to the originators, I. G. and S. O. for the work which they have done and which they will in the future contribute to the field. The other half could be distributed to the licensees according to the value of their contribution.

* * * * * * *

"Mr. Graham asked how much Goodrich would get from this pool. Mr. Howard said that he presumed Goodrich would get 2 or even 3%, Goodyear might get a like amount and, of course, Firestone and U. S. would have to be recognized to some extent. Mr. Howard left this question open so that it is possible an agreement could be made that Goodrich would get a fixed amount which might even be as much as 3%. (Note that rubber whether made by S. O. D. or licensee, contributes to the jack pot.)

* * * * * * *

"The sales outlet was then discussed. S. O. D. saw no way to control price other than by taking title to all of the rubber to be sold.

* * * * * * *

"Mr. Graham then asked if Goodrich could participate in the sales company. S. O. D. must realize that it will be necessary to give sales service along with the sales of the product. Mr. Howard was afraid that such an arrangement might come up against the antitrust laws.

* * * * * * *

"Mr. Howard is leaving for Europe. He will meet Mr. Ter Meer in Basle, Switzerland, on April 25.

"During the week April 15 to 19 Goodrich is to discuss with Mr. W. F. Avery, the suggestions made in the conference. Goodrich is to report their reaction to S. O. as early as possible but before April 25 so that word can go to Mr. Howard on April 25" (exhibit 227).

The statements quoted above should be compared with Standard's announcement to the various rubber companies in Howard's letters dated November 6, 1939, of which that addressed to J. W. Thomas, president of Firestone is typical.

"I have now to inform you that the I. G. Farbenindustrie has withdrawn completely from participation in this Buna development in the United States" (exhibit 79).

Digitized by Google

On the question of whether Goodrich was further advanced in synthetic rubber technique than some of the other companies the following comments are in point. Dr. Beller of Chemnyco informed Standard on October 31, 1939:

"However Goodrich may deserve preferential consideration in this respect due to their outstanding development work and widespread technical use of Perbunan for mechanical articles" (exhibit 78).

On November 13, 1939, Hopkins wrote Howard:

"Firestone is interested in any synthetic rubber development but it was quickly apparent that immediate interest in Bunas is not as keen as that of Goodyear and Goodrich. This is possibly for the reason that Firestone has done no work to manufacture synthetic rubber such as has been done by the others" (exhibit 86).

On November 15, 1939, Hopkins wrote Howard:

"U. S. Rubber has not done as much with synthetic rubbers as Goodyear and Goodrich. Without waiting for the results of the tire tests they feel fairly certain that Buna S would be a very good substitute for rubber, if it could be produced at a satisfactory price. * * * He [Roberts, Vice-Pres.] said that if his company had the Buna patents they would not hesitate to move fast in getting a plant going. If, therefore, Jersey was considering licensing a rubber company, U. S. Rubber Company would be very much interested in taking a license. *They would, however, want the license to be exclusive*" (exhibit 87).

It has been previously indicated that the Hague memorandum was adopted by Standard and I. G. Farben on September 25, 1939, and dated back to September 1, 1939, to antedate the war. It accomplished a rearrangement of the parties' interests in Jasco, Inc., the corporation which had been formed in 1930 to exploit certain processes for the joint benefit of the two companies, throughout the world outside Germany. As has been shown, one purpose was to make Jasco appear to be a Standard wholly owned subsidiary to avoid interference from the Governments of Great Britain, France, and the United States (exhibit 70). F. R. Loofbourow, Standard attorney, explained the situation in a letter to Walter Schaefer of Standard's comptroller's department dated December 11, 1939:

"As you know, Jasco was originally organized with Development holding 50% of the stock and I. G. holding the other 50%. Through the investment of Development the Mutual Plan Companies contributed considerable amounts to Jasco. It is now contemplated that Development, through Jasco, shall receive all the profit from operations in the United States, British Empire, and French Empire, and that I. G., through assignment of the remainder of Jasco's business to it, should receive all the profit from operations in the remainder of the world. This involves a transfer of I. G.'s investment in Jasco to the Development Company.

"An important feature of the deal now contemplated is that Development's profit shall be compared with that of the I. G. and periodical readjustments made if the new arrangement produces different income results than those contemplated under the Jasco Agreement. It therefore becomes necessary to keep the income from the exploitation of Jasco assets entirely separate from income of other Jersey subsidiaries and to keep the exploitation of Jasco assets on an entirely independent basis. For this purpose it is contemplated that I. G.'s shares in Jasco be put into the hands of trustees rather than into the hands of Development itself in order that the trustees may vote the stock in such a way as to prevent any confusion in this regard. Incidentally, this keeps Jasco from becoming a subsidiary of Jersey since Jersey would not have ownership or control of a majority of the voting stock, and the problem which we discussed in this connection no longer arises" (exhibit 228).

The trust arrangement was carried into effect and thus Jasco was kept from being a subsidiary of Jersey (Standard Oil Co. (N. J.)).

The following letter was written by W. D. Crampton, Standard representative in France, to F. A. Howard February 20, 1941:

"As intimated to you briefly the other day, Dr. Ringer came to Paris to see me before I left end of January, and asked me to give you the following message in regard to cable which he had received, I believe, from your good self:

" 'Jasco cable will be difficult but one underlying point is that Jasco contract has not been wiped out as agreed whatever done the final financial outcome original intention of old Jasco agreement should govern.'

"He also asked me to endeavor to obtain further information in regard to Buna and Jasco.

"He also requested me to endeavor to find out what has happened to the S. O. D. shares which were deposited against an amount of £37,000 to be balanced out

Digitized by Google

through licensed payments through Hambros. He stated that he has had no news whatsoever from the S. O. D. on this question" (exhibit 229).

With the purpose in mind of procuring as accurate information as possible concerning the development of butyl rubber, this witness representing the Anti-trust Division requested Mr. F. R. Loofbourow, attorney for Standard, to procure a signed statement by Dr. Per K. Frolich, director of the chemical division of Standard Oil laboratories, giving the facts. The 7-page letter signed by Per K. Frolich and addressed to Mr. F. R. Loofbourow was delivered to the witness on or about February 27, 1942. Its contents will be of interest to the committee. Particular attention is called to the statement on page 6 which reads as follows:

"During the year 1941 very little additional work was carried out by outside companies. There were two reasons for this, one being that we never succeeded in building up much stock, and the other that what material we were able to make did not represent any improvement over that on which tests had been conducted in 1940.

"Out of this work came the decision to change from butadiene to a higher diolefin in order to produce a butyl rubber of improved physical properties. Moreover, in November 1941 we felt that we had arrived at a solution of the problem of continuous operation, at least insofar as the general mechanical principle was concerned" (exhibit 230).

It will be recalled that the change from butadiene to higher diolefins, namely, piperylene and dimethylbutadiene, took place in August or September of 1940 while the tire-testing program was in progress. This is shown by exhibits 168, 169, 170, 171, 174, and 178.

EXHIBIT No. 138

NATURAL RUBBER CARTEL

Statement by Alfred Kahn

The events of the past few months have demonstrated more clearly than ever before the enormous importance of rubber to the American economy, and the months which lie ahead will drive home the lesson. The succession of industries already affected by the numerous official rubber conservation orders reads like a roll call of American manufactures, and more and more will feel the pinch as road transportation is cut down for lack of tires and as more and more essential uses of rubber must be curtailed. Momentary reflection upon the major uses of the commodity is a sufficient reminder of its ubiquitous services to modern civilization. In 1940 crude rubber constituted some 15 percent of America's total imports for consumption. The aggregate sales value of manufactured rubber products in that year amounted to some $950,000,000. In wartime its importance is even further magnified by the dependence of mechanized, fast-moving armies upon ample supplies.

This committee has thus far been hearing evidence concerning the way in which patents have been used to stifle American production of synthetic rubber and the threat to national existence itself which has resulted. It should be pointed out, however, that patents are but one instrument of (1) monopoly control and (2) international economic Machtpolitik, and they are by no means always the most important. The control of geographically concentrated sources of essential raw materials can be an extremely effective weapon of power diplomacy, and has been used as such with equally telling effect in the past.

The following brief survey of the way in which the control of rubber supplies of the Far East has been used as such an instrument should prove of interest to the committee for several reasons. It is clear, on the one hand, that the German use of the patent weapon in the past has by no means been unrelated to the British and Dutch use of their natural rubber monopoly. And, although the Germans have been much more ruthlessly efficient and much more narrowly devoted to national welfare (as they conceived it), the usages have not been dissimilar. The story of the rubber restrictions of the 1920's and 30's, besides, provides a useful background for the study of the development of synthetic rubber in the past decade. The one has had a direct bearing on the other. Moreover these problems do not belong entirely to the past. The question must inevitably arise at the close of the war of the proper relationship in the world economy of natural and synthetic rubbers. This decision will involve crucial aspects of post-war international trade and monetary policies. One essential cornerstone of the post-war world, set forth in the Atlantic Charter, is the free-

Digitized by Google

dom of access of all countries to essential raw materials. The question of what will become of crude as well as of synthetic rubber will, therefore, be an enormously important one.

The monopolistic controls of crude rubber cannot be attributed entirely, or even in major part, to political factors. The nature of the rubber market provides cogent reasons impelling the rubber producers to seek the protection of production and market controls, for "prudential" as well as "predatory" reasons. On the one hand the demand for rubber is relatively unresponsible to changes in its price; paradoxically, in view of its physical characteristics, its demand may be said to be inelastic. Sixty to sixty-five percent of the rubber imported into the United States is consumed in the manufacture of automobile tires. Consequently the major demand for rubber is complementary to the demand for highway transportation. But since the cost of the crude rubber has been estimated at only 28 to 36 percent of the total cost of production of an automobile tire, and since the cost of the tire represents but a small portion of the total cost of providing automotive transportation, changes in the price of rubber obviously have slight influence upon the number of automobiles sold or upon the extent to which automobiles and trucks are driven. In the case of most other rubber products, the inelasticity of demand springs from the lack of adequate substitutes. Moreover, since the expenditure required, within a wide price range, for such limited amounts of rubber footwear, hot water bottles, and garden hose, as the ordinary consumer could advantageously use constitutes an insignificant item in his annual budget, this demand is not much affected by price changes either.

The conditions of supply likewise present obstacles to a quick response to price changes. Insofar as the output of wild rubber is concerned the number of trees available for tapping is more than adequate, but these trees are of tropical habitat and to collect the rubber there would have to be employed native labor of these regions, whose sluggish response to economic incentives is notorious. Once the rubber culture has been established on a commercial basis, however, the long-run adaptation of supply to the price inducements offered by the market becomes feasible. But the expansion and contraction of rubber supply in response to price movements is still subject to retarding factors which have tended to make an unregulated rubber market exceptionally erratic. The basic difficulty in adjusting the output of plantation rubber to the market arises from the fact that a rubber tree requires about 7 years after planting to mature. Thus, embarking on cultivation is a highly speculative commitment. What the market conditions will be when the product becomes available is more a matter of guesswork than of foresight. Furthermore, the labor and capital "sunk" in a rubber plantation represent a considerable investment by the time the trees reach full productivity, and there are no alternative uses to which such a plantation can be shifted without sacrifice of virtually the entire investment. It is obvious that in these circumstances a planter will "think twice" before abandoning rubber cultivation in reaction to a declining market.

Some adaptation of supply to a "short-run" depression in the market may be effected by less frequent tapping of the trees, but resort to this expedient is hampered by the necessity of maintaining the labor force, and in any event there are financial limitations upon a policy of foregoing present revenue in favor of prospective revenue. This latter consideration places still more rigid limitations, of course, upon the simple expedient of withholding supplies from the market after the rubber has been produced. The prospective trend of prices is always uncertain and the uncertainty is enhanced in the measure that the market is being supported by nothing more dependable than a prudent resolve of the several planters, each acting independently, to husband his resources in anticipation of "a better day."

The combination of an inelastic demand and an inelastic supply of rubber creates a powerful tendency toward extremely wide fluctuations in price. This is abundantly illustrated by the history of rubber prices in the first two decades of this century. The uses of rubber in 1900 were still relatively unimportant. Thereafter the demand exhibited an enormous secular increase with the revolutionary changes in transportation associated with the automobile. Net world exports of rubber increased from 44,000 long tons in 1900 to 400,000 in 1919. But even this expansion of exports by the producing areas was, particularly in the period 1900–10, inadequate to keep pace with the rapid expansion of demand. As a result the price of rubber soared phenomenally, reaching fully $3 per pound in 1910. This enormous price rise in turn brought a rapid increase in plantings, but the expansion of supply lagged for reasons

Digitized by Google

already mentioned. The subsequent rapid decline in rubber prices to around 55 to 75 cents a pound in 1915 mirrored the tardy fruition of the heavy plantings induced by the price boom. This price range, was, however, still extremely remunerative, and the profits earned by the Far Eastern plantations, which by 1917 had almost completely eclipsed wild Brazilian rubber in importance, remained high. In the next 5 years it was the inelasticity of demand in the face of this greatly expanding supply which was responsible for extreme price fluctuation. The dearth of shipping space after the middle of 1917 resulted in a considerable accumulation of stocks in Far Eastern areas; their release after the war, coupled with the 1920 recession, to which supply was completely incapable of adjusting, brought prices down to around 16 cents per pound, or only 5 percent of the 1910 boom price.

Such conditions of market instability provide good breeding grounds for schemes for "collective security." In the circumstances, relief was sought through concerted control measures, and the history of the rubber market for the next two decades is largely concerned with the ups and downs of restriction devices and restrictive policies. That they did not develop earlier is probably attributable to the great secular rise of demand. Now, however, the major problem of the industry became one of preventing supply from continually outstripping demand in such a fashion as to jeopardize the profits of the rubber producers.

A market characterized by an inelastic demand is subject not only to enormous downward price fluctuation; it also offers additional incentive for exploitation by monopoly, since high prices will not bring a proportional diminution of sales. It cannot be doubted, therefore, that the exploitation of the consumer as well as mere beneficial price stability was an additional incentive.

Political as well as strictly economic factors also helped to mold the pattern of rubber controls. Ninety-seven percent of the world's rubber supply has been, since 1930, produced in British Malaya and the Dutch East Indies. One-half to three quarters of the world's total production, on the other hand, has been consumed by the United States. Mr. Winston Churchill, who was at the time of the institution of the first rubber restriction plan the British Colonial Secretary, is reported to have declared that "one of the principal means of paying the debt to America is in the provision of rubber." Manifestly one consideration behind rubber restriction was to make it possible for Britain, which was to have difficulty all through the 1920's in meeting its international obligations, to obtain some additional, badly-needed dollar exchange.

Clearly, so geographically concentrated a source of supply is particularly susceptible to monopoly controls. The incentives for such controls were extremely great, apart from the instability of the rubber market. On the one hand the stake of British and Dutch interests in the Far Eastern rubber was tremendous. Well over half of the entire rubber acreage in the Far East at the end of 1940 was estimated to be owned by a large number of foreign companies, the majority of which were incorporated in Great Britain or Holland, and the shares of which were usually quoted on the London and Amsterdam Security Exchanges These foreign-owned plantations operated under many handicaps in comparison with the native plantations. A heavy capital investment, heavy continuing overhead costs for supervisory personnel and other executives, heavy initial developmental costs, and the necessity of paying continuous dividends to absentee shareholders if the market prices of the investments were to be maintained all put a burden upon the large foreign-owned plantations which the small scale native producer, employing his own land and labor, did not have to meet. An additional factor creating a vested interest in the maintenance of the status quo was the system of management of these plantations by large agency firms with a strong interest in retaining the business of all the large plantation owners, both high and low cost. With their generally higher costs, with their sophistication in matters of restriction and market controls, with the unifying influence of the agency firms, it is no wonder that the large foreign plantation owners have in the past pressed for restriction schemes in rubber much more vociferously than the generally small unorganized native producers.

THE STEVENSON PLAN

The immediate occasion for strong advocacy of rubber restriction was the sharp break in prices in 1920. The Rubber Grower's Association, a voluntary group composed of plantation companies, with headquarters in London, promptly

Digitized by Google

called for a 25-percent restriction of output for 1 year beginning November 1, 1920. Although this voluntary restriction had some success, the brightening of the American business outlook toward the end of 1921 and the rise of the price of rubber from the low of 16 cents in 1920 to over 30 cents defeated all efforts to have it renewed. The association appealed to the Government for its intervention to compel curtailment, and on October 24, 1921, the Secretary of State for the Colonies appointed a committee to formulate a plan of compulsory restriction. This became known as the Stevenson Committee, from the name of its chairman. The composition of this committee, is significant. Lord Stevenson was the personal commercial advisor of Winston Churchill, then Secretary of State for the Colonies. It seems fair to assume that he, together with the two other subordinate cabinet representatives on the committee, was motivated by considerations of appropriate imperial policy—to maintain the value of these investments and prevent forced sales to American tire manufacturers, and, as has already been suggested, to provide Britain with sufficient dollar exchange to pay her obligations to America. The five nongovernment members of the committee were connected with the London agency firms that have already been described and were directors of large Malayan estates. As such they were interested in maintaining the relative position and the profits of the high-cost British-owned production, which could only be done by restricting competition. The committee as a whole therefore, had a common outlook, for its economic and political motivations coincided.

After 6 months of deliberation during which the Committee approached the Dutch Government with a view to securing its cooperation and received no definite encouragement, a report was made on May 19, 1922, outlining two alternative procedures. One was to restrict production (the actual tapping); the other was to restrict exports by imposing heavy taxes on shipments above stipulated amounts, the export quotas to be adjusted to the market prices of rubber. The Committee counseled against the adoption of either scheme however, unless the cooperation of the Dutch could be enlisted. When further representations to the Dutch Government proved futile, the Stevenson Committee resumed its deliberations and, upon the urgent solicitation of the Rubber Growers' Association, finally on October 2, 1922, in its second report, disregarding its own earlier advice, recommended the adoption of the second alternative scheme outlined in its previous report. By bills rushed through the colonial legislatures the Stevenson plan became law on November 1, 1922.

The basic features of the plan adopted were (1) that production quotas (called standard assessments) were assigned the several plantations and negotiable permits issued quarterly for exportation, without tax penalty, of a certain percentage of the assigned quota and (2) that the permissible (or licensed) exports for any quarter were regulated automatically by the average price of standard crude rubber (in the London market) for the preceding quarter. Thus, the discretionary power of the administrative authorities was limited, in effect, to the establishment of the standard assessments. These were supposed to be based upon the actual output in the year ending October 31, 1920, but since adjustments were sanctioned to take account of various special circumstances, most notably of plantings reaching maturity subsequent to the base period, the discretion of the assessors, committees of planters and civil authorities, was rather wide. As a result, the life of the Stevenson plan was marked by continuous controversy between the various colonies, districts, and individual producers, between large and small, corporation, and native-owned estates, each seeking larger assessment at the expense of the other.

From the standpoint of market consequences in the short run, the Stevenson plan was a great success if its objective was to increase the profits of the rubber plantations. On the other hand, if the sponsors and proponents of the scheme intended to stabilize rubber prices, or regularize the rubber market, it was a dismal failure.

Quite apart from any consideration of the question of the economic justification for the adoption of 15 pence, roughly, 30 cents, as a pivotal price for crude rubber, so rigid were the mechanics of the scheme that the adaptation of exportable supplies was almost certain to be tardy in response to any major swing of demand. And no provision was incorporated in the plan designed to anticipate, and thus in some measure to iron out fluctuations in demand. The consumers' interests insofar as American rubber manufacturers are concerned (and they were then taking a full 75 percent of total world exports, a share which has latterly declined to about half of the total) were neither represented nor consulted. A rapid rise of

Digitized by Google

demand in the years 1924–25 as a result brought but tardy and inadequate adjustments of supply, and the price soaared to $1.23 per pound in July 1925.

Not all of this spectacular advance in the rubber market is traceable to the arbitrary constriction of supply, of course. There were important factors on the demand side of the market operating to boost prices, also. Aside from the influence of general business recovery both in Europe and America, which was tied up with a boom in the automobile industry in particular, there was a specific technical development tending to spur the demand for rubber. This was the introduction of balloon tires, which increased rubber consumption per tire by some 30 percent. Nevertheless, such considerations do not mitigate the force of the criticism of the Stevenson plan on account of its rigidity and its failure to provide for the representation and assertion of the principal consumer interests (American) as an integral part of the controll mechanism set up. For it was precisely the incapacity of the scheme to meet such conjunctures and moderate their market-disturbing effects which constituted its basic weakness, if judged by standards of economic stabilization and social planning.

A vehement agitation was provoked in consuming countries, and especially in America, against what was denounced in nonofficial quarters as a sheer hold-up. As a belated answer to these protests, for the quarter beginning February 1, 1926, an increase from 85 to 100 percent of allowable exports was authorized in place of the 10-percent increase which would have been mandatory under the plan without amendment. But this token of penance was not all sugar; it was a sugar coating for a pill of quite different taste. For accompanying the authorization of an extra allowable there was a change in the general provisions governing adjustments which raised the pivotal price nearly 50 percent, from 15 to 21 pence. In spite of this revision of the scheme which resulted in a reduction of the rate of permitted exports to 60 percent by May 1, 1927, and held it at that level for the last year and a half before repeal of the legislation, the market price continued steadily to decline.

The principal factors responsible for this diminishing efficiency of the restriction scheme (apart from the "psychological" influences on the market in the latter stages of its operation, for anticipation of its early demise) and for its final abandonment in 1928 may be summarily reviewed. These factors were of three distinct types. Ranked in the order of their probable measure of influence, they were (1) the growth of rubber production outside the restricted areas; (2) the development of substitutes for, and economies in the use of, crude rubber in consuming countries; and (3) defection and smuggling among those subject to the restrictive scheme.

In the period 1920–27 the share of the British Colonies in the world rubber market declined from 66.2 to 53.0 percent; the share of the other Far Eastern producers, mostly Dutch, rose from 23.0 to 39.8 percent in the same period. Here was a shift in commercial power which the British could not ignore. Of similar significance to this, from the British viewpoint, portentous development was the initiation of plantation projects by American rubber manufacturers in other areas, most notably by Firestone in Liberia. These enterprises had no immediate effect upon the statistical position of the market during the period in which the Stevenson plan was in operation; indeed, for a variety of reasons they have contributed little to world supply to date. But they were a signal emphasizing the import of the Dutch East Indian expansion—if that needed any underscoring.

The development of substitutes for crude rubber was spurred both by the high price of the natural product and by the arbitrary manner in which it had been brought about. The enormous rise of rubber prices was undoubtedly an important stimulus to the renewal of research in synthetic rubber both in the United States and Germany, which laid the basis for its production in the 1930's.

Another, and in the immediate conjuncture far more important, substitute for crude-rubber imports was reclaimed rubber. The expansion of the rubber-reclamation industry in the United States reached its peak in 1928, the last year of restriction under the Stevenson plan. The ratio of reclaim to crude rubber used in the United States rose from a low of 19.1 percent in 1922 to 50 percent in 1927 and 1928. While prior to the present emergency this scale of rubber reclamation was not maintained, the proportion of reclaim to crude rubber absorption has displayed a remarkable degree of correlation with the price of the imported crude. Thus the percentage declined to 21.2 in 1933, with the severe fall in crude-rubber prices, and increased steadily with the subsequent rise of crude prices, to 32.1 in the first 10 months of 1941, except for a break with the decline of crude prices in 1938. However the experience gained in use of re-

Digitized by Google

claim in rubber mixes evidently resulted in a permanent increase in its use. The fact that, as the price of crude rubber fell from 1928 through 1931 until it averaged slightly more than 1 cent per pound higher than the prime grade of reclaim, the proportion of reclaim to crude used fell only from 50.7 to 35.1 percent, may have been due, in part, to inertia. But it is noteworthy that in the last 6 years (1936–41), when the average price of rubber was lower than in the 4 years from 1921 to 1924, the proportion of reclaimed rubber used was considerably higher than in the earlier period.

The third factor impairing the efficacy of the Stevenson restriction scheme and contributing, in however minor a measure, to its eventual abandonment was the persistence of smuggling, and the development of discontent and disharmony among the planters, the latter growing out of jealousies kindled by allegedly inequitable "assessments" (quotas), out of evidences of official corruption, and out of divergent views on restriction policy.

These several factors all operated along with the attendant progressive deterioration in British-American relations, to persuade the British Government in 1928 that continuation of rubber restriction, at least upon an independent (British Empire) basis, would be a mistake. Hence the plan was abandoned in that year.

THE INTERNATIONAL RUBBER REGULATION AGREEMENT

The end of production controls, the drastic decline of the demand for rubber in the great depression, and the fruition of the plantings of the prosperous mid-1920's made the depression of rubber extremely severe. Despite an attempt to secure a "tapping holiday" in May 1930, world stocks accumulated at an alarming rate, world exports contracted only from 863,000 to 708,000 tons between 1929 and 1932 and were back at the 1929 level in 1933—and prices cascaded from an average of 20.48 cents per pound in 1929 to 10.24 in 1930 and 3.43 cents in 1932. By 1933 even the Dutch were ready to consider concerted measures to counteract the depression.

Negotiations begun in 1933 resulted in an intergovernmental agreement of May 7, 1934, between the Governments of the United Kingdom, India, The Netherlands, France, and Siam. This agreement was renewed in October 1938, to run for an additional 5 years. In it basic quotas were assigned to each of the nine rubber-producing areas into which the territories of the five signatories were divided. On the basis of these quotas were fixed the voting powers of the various delegations, which constituted the administrative body, the International Rubber Regulation Committee (hereinafter I. R. R. C.). The committee was empowered to fix periodically a percentage of the basic quotas, to which each of the signatories undertook to limit its exports for the period specified. Production control was provided by prohibiting the accumulation of surplus stocks within the areas as well. In addition, new plantings were with minor exceptions prohibited during the period of the pact.

Not only was production by the agreement areas restricted, but in addition the export of "leaves, flowers, seeds, buds, twigs, branches, roots, or any living portion of the rubber plant that may be used to propagate it" was prohibited. If this provision is reminiscent of the restrictions on exports of machinery, or emigration of skilled labor which were widespread in the civilized world until the eighteenth and nineteenth centuries, and were until fairly recently considered relics of barbarism; if it prevented the free flow in international commerce of goods and ideas whereby the wealth of the world is supposed to be maximized; it has nevertheless always been one means of varying effectiveness, of reinforcing national monopolies, and it cannot be denied that it serves at least the short-run interests of the monopolist.

The international rubber-restriction scheme had several superiorities over its predecessor of the 1920's, from the point of view of the parties thereto. First, and most important, it covered over 95 percent of the world's producers and thus overcame the fatal weakness of the Stevenson plan. Its control of production was stronger, by the prohibition of new plantings, and of the accumulation of nonexported stocks, and the growth of competitive production in outside areas was restrained by the prohibition on exports of seeds, etc., mentioned above. In addition, the mechanism provided was more flexible. The I. R. R. C. was given discretionary power to control the amounts of rubber exports directly and of production, indirectly. There is no rigid scale of percentages of the basic quotas related to average market price to hamper the administration of the scheme, as there was under the Stevenson plan.

The international rubber regulation agreement was presumably guided by a socially more acceptable standard than the price objectives which had served

Digitized by Google

as a guide for the operation of the Stevenson plan. The objectives of the agreement were said to be the attainment of a normal figure of world stocks, an orderly manner of adjusting supply to demand, and a price both "fair and equitable" and "reasonably remunerative to efficient producers." General agreement with respect to such broadly stated objectives, however, did not succeed in eliminating the basic economic conflicts and sources of friction that have been mentioned in connection with the Stevenson plan. The directorate of the committee was still largely dominated by representatives of the agency firms, who had a vested interest in maintaining existent production rather than encouraging the displacement of inefficient by efficient production. The freezing of quotas and exports operated to the detriment of low-cost native producers, in that it deprived them of what would otherwise be a competitive advantage. While competition would have eliminated the high-cost producers, the restriction schemes had the effect of holding a price umbrella over them.

The objective of the scheme was to raise and maintain remunerative prices by restricting exports and reducing stocks which had grown so greatly during the depression. It succeeded. The combination of restriction and world recovery raised the price of rubber to a peak of 25 cents a pound in March 1937—100 percent above the price prevailing when it first went into effect. Such results certainly demonstrate effective market control—at least in the short run. The sharp decline in world consumption in 1938 was met by a drastic reduction in the permissible exportable percentage, from 90 percent in the latter half of 1937 to exactly half, 45 percent, 1 year later, with the result that stocks continued to decline. The price nevertheless fell substantially to 16.4 cents in the last quarter of the year—but this was still 25 percent above the 1934 level.

The rubber market was practically dominated by the war in the years 1939, 1940, and 1941. The I. R. R. C. cannot be said in the circumstances to have seriously altered either its point of view or its generally conservative policy. On the contrary, the committee evinced a disposition, if not to maximize the immediate revenue-yielding potentials of its strategic position, certainly not to forego any profit-making prospects within the limits imposed by a prudent regard for self-interest. The proportion of permissible exports to basic quotas was held to 58.75 percent in 1939, and to 83.75 percent in 1940. It was not until the growing danger of rubber exports being curtailed by enemy action became apparent even to the man in the street that these self-imposed market-supporting restrictions were abandoned in 1941. This, despite the fact that the threat to an uninterrupted rubber supply for the American market had become so menacing that in June 1940 the Reconstruction Finance Corporation had organized the Rubber Reserve Company and embarked on a large-scale purchasing program. The market price rose steadily to a level in May 1941, practically the same as the peak reached during the boom 4 years earlier. Thereafter, thanks mainly to the intervention of Rubber Reserve, which on June 21, 1941, became the sole importer of crude rubber, the price was stabilized.

The question will inevitably arise as to the extent to which America's inadequate accumulation of a natural rubber stock pile was attributable to the operations of the I. R. R. C. The evidence is certainly not clear, and certainly the American authorities cannot be said to have been particularly far sighted or forceful in the entire affair. Nevertheless the following facts should be noted:

1. In the barter agreement of 1939 between Great Britain and the United States, this Government acquired 90,000 tons of rubber only with the stipulation that, barring an emergency, none might be put on the market for 7 years.

2. The same limitation was placed upon the Rubber Reserve Company in its agreement of June 1940 with the I. R. R. C., whereby it acquired its first 150,000 tons—except that the expiration of this limitation was set for 1943. However, in 1943 and after the rubber to be released by Reserve was restricted to 100,000 tons annually.

3. The permissible exportable portion of quota output averaged only 84 percent in 1940, and was not raised to 100 percent until 1941. By that time shipping difficulties and the Japanese took over the task of keeping America unprepared.

4. The prohibition against export of seeds, etc., from the superior Indonesian strains may well have prevented a more rapid increase of production elsewhere.

The evidence suggests thus that by the narrow pursuit of its own interests the I. R. R. C. may have contributed somewhat to American unpreparedness. Nevertheless the major portion of the blame, it would appear, can scarcely be placed at their door, if indeed it can be placed anywhere. Had the responsible American officials been able to foresee the dangers (and it by no

Digitized by Google

means necessarily follows that it is reasonable to expect that they should have) and had they acted forcefully, any obstacles created by the I. R. R. C. could doubtless have been eliminated. Nor is there evidence that in fact the obstacles were serious, that it was the export quotas which prevented the acquisition of an ample stock pile. And if the restrictions placed upon the ability of Rubber Reserve to dispose of the rubber, except in emergency, could not have been swept away by a strong American stand, it still should not have prevented the accumulation, which was precisely for such emergency use. Finally, as to the prohibition on exports of seeds, etc.: However reprehensible in principle, it can scarcely be believed that it prevented any substantial rise of rubber culture, elsewhere. In view of the almost negligible rise of competitive non-Asiatic rubber-producing areas during the 1920's when the price passed $1 a pound, and when the export of seeds and shrubs was uncontrolled—it is difficult to argue convincingly that were it not for this restriction, there would have been such an increased competition in the thirties, when the price reached only 25 cents a pound.

On the whole, it must be conceded that the I. R. R. A. plan has operated less perversely as a market "stabilizing" device than did the Stevenson plan. There have been no such violent price fluctuations as those which attended the earlier scheme. Whether the course of the market as been more erratic than it would have been in the absence of "restriction," no one can say positively. It is possible that this explains the tolerant attitude of the American rubber manufacturers toward the domination of their raw material market by "outsiders" intent primarily upon serving their own interests. The attitude of the American consumer, however, deserves somewhat closer scrutiny. America has during the life of this second cartel taken some 50 percent of the latter's rubber exports. And four large American companies have consumed probably two-thirds of this total. Why have these industrial giants permitted this monopoly of their raw material supply?

Their inaction was undoubtedly attributable in part to their own stake in far eastern rubber. Aware of the danger of reliance upon a source of supply of raw material which they could not control and afraid of possible price squeezes to which they might be subjected, the tire manufacturers, with the exception of Goodrich, had stepped out and acquired rubber plantations for themselves. The values placed on the rubber plantations of Goodyear, United States Rubber, and Firestone amounted to 6 percent, 11 percent, and 12 percent, respectively, of the total values of those three companies. Analysis of the United States Rubber Co.'s financial statement for 1938 (when the rubber plantation company was consolidated with its parent) discloses that the United States Rubber Co. was making a 30-percent profit on its cost of producing crude rubber. Assuming that the other companies were making similar profits for similar reasons, the ownership of these large estates may have tended to give them an interest in the maintenance of the status quo in the Far East and in the operation of restriction schemes tending to support the price of crude rubber; they would hardly want to see an important investment depreciate in value or to be deprived of a steady source of profit.

However, their stake as consumers of rubber was far greater than as producers. The combined crude production of Firestone, United States Rubber, Goodyear, Ford, Raybestos-Manhattan, and the Intercontinental Rubber Co. amounts to a bare 6 percent of the yearly imports of crude rubber. No company has plantations to supply more of its crude rubber requirements than the United States Rubber Co., which obtains about one-fifth of its supplies from this source. The Firestone plantations in Liberia, those of Goodyear in the Philippine Islands, Panama, and Costa Rica, those of Ford in Brazil, and the guayule holdings of the Intercontinental Rubber Co. do represent definite efforts to establish sources of supply free from foreign domination, however. But these are only about one-sixth of the foreign rubber holdings of American companies, and Firestone and Ford are the only ones that do not also have plantations in British or Dutch territories in the Far East. Their acquiescence in the rubber restriction may therefore simply reflect their impotence. Or it may be a reflection of their conviction that, providing the foreign interests could be prevailed upon to take a long-run perspective, the jeopardy to the interests of American manufacturers (and consumers) would be minimized. In other words, they may have figured that the jeopardy would be less than it would be from the adoption of an antagonistic attitude backed up by vigorous efforts to develop alternative sources of supply. Besides the length of time (7 years) necessary

Digitized by Google

to obtain a return of capital sunk in rubber-growing, while perhaps not in itself a decisive deterrent, does tend to make less attractive undertakings which have to be carried on in far-distant tropical countries than would the same undertakings be if cultivation were practicable in politically more stable regions.

From the point of view of the manufacturers, a stable crude rubber price, even if relatively high, is more to be desired, assuming its stability can be maintained, than a lower range of prices which might be subject to somewhat more frequent fluctuation. They have not forgotten, it may be presumed, the severe inventory losses they have suffered on more than one occasion in the past. Proof of their interest in the stability of prices was the operation of a $40,000,000 buyers' pool from the end of 1926 to the beginning of 1928, formed by the leading tire and automobile manufacturers in order to keep the price of rubber from falling, and so to avoid inventory losses. Moreover, they are quite well aware, no doubt, of the high degree of inelasticity in the demand for most rubber products. The significance of this inelasticity of demand is that, so long as the several manufacturers pay the same price at the same time for their raw materials, it is of little concern to any of them whether that price be high or low.

Certainly one major weapon with which to combat a crude rubber monopoly, in addition to the increased use of reclaim, was the development of synthetic rubber. The major part of the story of synthetic rubber has already been discussed. It cannot be told completely, however, unless the influences of the natural rubber story are suggested. It will be noted, for one thing, that the Goodrich Co., which alone of the big four rubber manufacturers owns no foreign plantations, has led the others in experimentation with synthetic rubbers. These two facts cannot be unrelated. However, whether this means that it was their vested interests in natural rubber which diminished the desire of the others (except for Goodyear) to probe the possibilities of synthetic rubber, and made Firestone and United States Rubber willing to accept the Standard Oil contracts which in effect reserved the buna for high-cost specialty uses, or whether it was Goodrich's faith in the synthetic product which made it unwilling to invest in natural rubber plantations—cannot be said without further evidence.

Again, evidence before this committee has already indicated that I. G. Farben was considering selling its patents for the production of synthetic rubber to the I. R. R. C., clearly understanding that the latter's sole interest would be in purchase for the purpose of suppression. It must be stressed that if I. G.'s motives in such a transaction would have been the further retardation of American production of synthetic rubber, those of the I. R. R. C. would only have been considerations of commercial expediency. The point is, however, that the latter may have proved just as dangerous to American security as the willful economic aggressions of I. G. Farbenindustrie. Whether actual negotiations in this proposed transaction were ever undertaken, whether the I. R. R. C. ever even knew of the possibility, cannot be stated. The possibility remains significant. It is perfectly clear that wherever possible, these interests would, naturally, counsel against the exploitation of the possibilities of synthetic rubber; certainly they would have been pleased with the American Government's policy, until 1941, of concentrating on the accumulation of a large stockpile of natural rubber, rather than of risking many millions "uneconomically" in experimental synthetic rubber plants.

On the other hand the possibilities of synthetic rubber must have placed some limits on the policy of the I. R. R. C. in the thirties, and helped maintain reasonably high export quotas, and correspondingly reasonable prices. The intensity of industrial research in synthetic rubber, as the amount of reclaim used in proportion to crude, has fluctuated in close correspondence with the price of natural. Although the World War and the preparations therefor were doubtless an important factor, to the enormous rise of rubber prices after 1900 must be attributed in large measure the first great wave of industrial research in synthetic rubber, mainly in Germany. The great price fall after 1920 was in turn largely responsible for a corresponding decline in this research, to which the end of the war contributed, and the great price rise to 1925 for the considerable revival of interest in Germany and the United States in the middle twenties. Again, to the successful price record of the I. R. R. C., after 1934, must be attributed some of the great interest of the Goodrich and Goodyear companies in obtaining buna licenses or developing their own rubbers. If only the industrial arts were freed, such natural monopolies as rubber would

84949—43—pt. 4——20

Digitized by Google

enjoy a much more restricted margin for playing fast and loose with the hapless consumer.

The problem of rubber in the post-war world will be a serious one. Much will depend upon the extent to which the technical promise of synthetic rubber will be fulfilled. It may be that the political problem of geographically concentrated supplies of raw materials may be automatically solved, by the march of science, which it will have taken a war to free from the restrictions placed upon it by private interest. It may be, however, that a more efficiently run plantation system will still be the most economical source, in which case much will depend upon the commercial policies adopted by the major consumers, and synthetic producers. The United States will have to strike a more even balance between the various considerations of military security, and international economic and political stability than it has in the past. And a decision will have to be made concerning the place of the international cartel, while considering on the one hand the rights of the consumer and the Nation, and on the other the inescapable quest of labor and capital for security in such an inherently insecure situation as the play of free competition would leave the rubber producer. There is no simple choice between black and white, good and evil, personal integrity or treachery. It would be so simple if it were! Nevertheless certain dangers which our present predicament has brought to light, and which this study has attempted to describe, must be prevented from recurring when the interests of national security are less obvious, and less sedulously safeguarded than they are at present.

EXHIBIT No. 139

PATENT POOLS, STANDARD OIL CO.-I. G. FARBEN

Statement by Patrick A. Gibson

I appear in response to the subpena of this committee with the task of presenting the patent pooling arrangements between Standard Oil Co. of New Jersey and I. G. Farbenindustrie, of Frankfort am Main. I shall attempt (1) to present a more detailed picture of the basic 1929 and 1930 agreements and (2) to trace, in the field of oil refining, the principal industry-wide patent agreements that have stemmed from the basic allowances between Standard and I. G.

On November 9, 1929, Standard and I. G. executed four separate instruments, by which the parties clothed with a constitution an alliance arrived at between them. In substance, Standard agreed to refrain from going into any chemical business in the future except as a "junior partner" of I. G. and under I. G.'s domination and control. In turn, I. G. agreed to remove itself from and stay out of the oil industry except in Germany.

Testimony on the subject of acetic acid, the Paraflow products, the methane steam process, and the synthetic rubber patents have shown arresting instances of the critical impact of the 1929 agreements upon the American economy today. We thus turn back to 1929 not for study of ancient history but for an understanding of the 1940's.

This committee has already inquired into some of the particular consequences of the 1929 agreements on the American chemical industry. The field of oil refining remains for more particular study. The basic agreements and the many deals and patent pools that followed in this field are signal instances of the use of patent agreements to carry out commercial understandings in suppression of competition and to acquire and perpetuate industrial control and economic advantage. Since 1929 they have operated within the United States and throughout the world. Yet only recently has the Government of this country obtained knowledge of the facts. Let us look at the nature and office of this contractual network.

BASIC AGREEMENTS BETWEEN STANDARD AND I. G.

Their purpose.—In the negotiations leading up to the interdependent basic agreements between Standard and I. G., the president of I. G. characterized their objective as follows:

Digitized by Google

"As Dr. Bosch now saw it, the only solution would be to consider that the two companies were married for a long period and that each must respect the other's interest; that a real solution could be found only by realizing that the I. G. interest and the S. O. interest were the same, and that whatever Standard did would react to the interest of the I. G. as well" (exhibit 1).

The agreements were characterized by the president of Standard, Walter C. Teagle, as follows:

"Teagle stated that it is the sincere desire of N. J. to form a close association with I. G. on all world problems of mutual interest; that he appreciated the many difficulties now existing, but that he cannot see how the interests of the two companies can conflict" (exhibit 2).

E. M. Clark, president of Standard Oil Development Co., Standard's patent exploitation subsidiary, stated that Standard was interested in:

"Complete partnership in everything—ironing out in the spirit of friendship the little troubles that will arise from time to time" (exhibit 3).

The circumstances attending consummation of the treaty between Standard and I. G. and the purposes pursued and methods adopted were broadly stated in the following minutes, which are so fully informative that I quote at length:

"Memorandum of meeting—March 21, 1929

"*Place.*—Board Room, New York City.

"*Present.*—Messrs. Bosch, Gaus, Schmitz, von Knieriem, of the I. G. Teagle, von Riedemann, Clark, Howard, Haslam, of S. O.

"Dr. BOSCH opened the meeting by reviewing our discussions at Heidelberg and their objections to our proposition of last summer. With respect to our recent proposition, he stated that the I. G. were willing to discuss it but the following points were not clear:

"1. The fields of the two companies should be kept separate. The I. G.'s primary business is synthetic organic chemicals, while the field of the Standard is petroleum. If an agreement is reached taking the I. G. out of the oil business, except in Germany, it should be possible to clearly define the fields of the respective companies. * * *

* * * * * * * *

"Dr. BOSCH then discussed point No. 1 above. He stated that it was his impression that the Standard was only interested in the petroleum business. The I. G. would now withdraw from this field, except in Germany, and, to avoid future conflict, thought an understanding should be reached so that the Standard would not go into the chemical field (such as dyestuffs, ammonia, etc.) in competition with the I. G. He appreciated that we were in the solvent business and stated that the I. G. were willing to go along with Standard in this field, but felt that the leading factor in this field should be the I. G.

"Mr. VON RIEDEMANN asked Dr. Bosch if he did not think that the Standard would be driven into the chemical field due to the similarity of coal and oil as raw materials for the hydrogenation process.

"Dr. GAUS stated that hydrocarbons had a big future in the chemical field for the I. G. If a complete deal is made between the two companies, the Standard would become acquainted with the I. G.'s chemical processes, and this might bring the Standard and I. G. into contact in this field, without an agreement, and competition might develop between the two companies.

"Dr. BOSCH replied, in answer to Mr. von Riedemann's question, that he expected the Standard would be driven into the chemical field and that the two companies should lay their plans accordingly.

Mr. VON RIEDEMANN stated that Standard's thought in the matter was that our coal and oil agreement with the I. G. should be in two parts: (1) Covering the United States, and (2) covering the rest of the world, except Germany.

"He pointed out that Sir Henri Deterding would be in on the second part, and suggested that, to help Standard, the I. G. put a fair division of the price we are to pay on these two divisions of the agreement. The question of our position in the chemical field should be considered in the U. S. portion of the contract.

"Dr. BOSCH replied that it was not to the interest of the I. G. to separate the fields, and asked if the fact that the Shell interests had gone into the ammonia field was one of the reasons prompting Mr. Riedemann's suggestion.

"Mr. VON RIEDEMANN replied in the affirmative.

Digitized by Google

"Dr. BOSCH stated that the I. G. were willing to take the Shell into the ammonia field to a small extent, as the field should be big enough to include both.

"Mr. Teagle, to explain further Mr. von Riedemann's suggested division of the contract, outlined our relation to the Shell in this matter, as follows: After our conference last year we went to Sir Henri Deterding and stated that, if we made a world agreement with the I. G., we should hold the door open to him, except that Germany was withheld for the I. G. and the U. S. withheld for the Standard. The I. G. are the only ones who can really appraise the relative value of their patents in the U. S. and the rest of the world outside of the U. S. and Germany. Also, our membership in the so-called "Patent Club" was pointed out as an additional reason for such a division.

"Mr. VON RIEDEMANN explained the T. I. J. contract very briefly.

"Mr. HOWARD pointed out that we were already interested in chemical and pharmaceutical specialties, such as NUJOL and FLIT, on the one hand, and solvents, on the other hand, and that we have carried out extensive research and development work in the solvent field.

"Dr. BOSCH stated that he had reference not to our present activities but to future developments. He explained their agreement with the Winthrop Chemical Co., which is to sell I. G. products. With regard to solvents, he stated that I. G. were very much interested and would like to come together with us. He stated that he desired to prevent our competition in colors, pharmaceuticals, etc., with particular reference to new products, and explained in confidence certain developments which they had already undertaken. In the matter of these new developments, he wished the management and dominant interest to be in the hands of the I. G. He stated that it was the policy of the I. G. not to go into old fields already occupied but to create new industries and new fields, that the I. G. did not wish to go into competition in the U. S. with the U. S. chemical industry. * * *

* * * * * * *

"Dr. BOSCH stated that what he wanted was a declaration of policy covering the whole world and that it could go in the U. S. coal and oil agreement, if desirable, but he did not want to have to negotiate a new agreement later on.

"Mr. HOWARD pointed out that it could not go in our present proposed agreement, since our agreement must be shown to others, and inquired whether Dr. Bosch wished us to agree not to go into the chemical business except as a junior partner.

"Dr. BOSCH stated that in their chemical work they would extend to us an invitation to come in with them, as no other company would be so satisfactory to the I. G.

"Messrs. BOSCH, TEAGLE, VON RIEDEMANN, and CLARK all felt that a written, rather than a verbal, understanding on this was desirable.

"Mr. TEAGLE stated that we were willing to be junior partners in the chemical field provided our minority interest was sufficiently large.

"Dr. BOSCH replied that they would offer us 49%. * * *

* * * * * * *

"On reconvening, Mr. TEAGLE stated that Dr. Bosch's suggestion at Heidelberg that Standard take over the entire coal-oil process outside of Germany did not provide for I. G.'s continuing financial interest, which Standard considered to be highly desirable, and consequently Standard proposed that Shell, Standard, and all others would have to pay the same 2¢ per barrel royalty" (exhibit 4).

Nature of agreements.—By the first of these agreements, referred to as the division of fields agreement (exhibit 1), I. G. agreed that should it wish to go into a new chemical development anywhere in the world, outside of Germany, that could not be carried on except as a department of the oil and gas business, I. G. would give Standard control. I. G. further agreed that if it were to go into a new chemical development not so closely related, but nevertheless related, to Standard's oil business, it would offer Standard a substantial, but not controlling, interest in such enterprise. Standard, on its part, agreed that if it should desire to enter a new chemical business anywhere in the world not closely related to Standard's then business, Standard would offer the controlling interest in the new chemical development to I. G.

Thus, as from 1929 to at least 1947, the earliest date at which the agreements could be terminated by the parties, the largest industrial corporation in the United States surrendered its freedom of action in the chemical industry into the hands of the largest industrial corporation in Germany. Scarcely even sin-

Digitized by Google

cerity can attach to the recently publicized argument that this renunciation of liberty of action in the chemical industry by Standard was only natural for an oil company, since as early as 1928, almost 2 years prior to the execution of this agreement, an official of Standard wrote:

"The petroleum industry is rapidly becoming a chemical industry and has, of course, available to it the largest supply of raw material, both in its natural gas and crude oil. Looking to the future, it is evident that the manufacturing and marketing interest of the large refining companies will clash with the large chemical companies" (exhibit 5).

At the present time the place of an oil industry in chemical production has been made perfectly plain. Now that Standard has been driven into the chemical field by the absolute compulsion of war itself, it advertises and takes credit for the fact that large amounts of petroleum are being processed into chemical products for vital war needs.

The Jasco agreement.—The Jasco agreement of September 30, 1930 (exhibit 6), set up a mechanism for carrying out the division of fields agreement. It is not one of the four basic agreements.

The Jasco agreement provided for the creation of a Louisiana corporation called Jasco, Inc.—Joint American Study Co. Its stock was issued 50 percent to Standard and 50 percent to I. G., but the rights to its control and to its assets and profits were governed by the agreement. It was stipulated that when either party should develop a new marketable chemical product, or a new process for making a marketable chemical product utilizing natural bitumen, gas, or petroleum, as raw material, the developing party should offer the other the right to require that it be brought into Jasco.

When brought into Jasco, the process would thereafter be developed by the joint company, and licensed or otherwise promoted by the corporation. The originator of the process would receive roughly five-eighths of the profits, the other party three-eighths. It has frequently been represented by Standard that the originator of any process that was placed in Jasco was entitled to the control of the licensing or other exploitation of such process brought into Jasco. On this point I simply quote from article 7 of the Jasco agreement:

"The parties shall try to come to agreement on all matters having to do with the handling of any chemical process brought to the Joint Company but in case of failure of agreement the decision shall rest with the party which would have been entitled to the control of the process under a certain agreement of November 9, 1929, between I. G. and Standard Oil Company (New Jersey) * * *" (exhibit 7).

Therefore, I. G. would control the exploitation of the process in all cases except the following: (1) If the process were originated by Standard but was closely related to Standard's business as of November 9, 1929; (2) if the process were originated by I. G. but could not be advantageously carried on except as a department of the oil or gas business. For example, under this agreement Standard incurred the obligation to give I. G. the right to require that Standard's butyl rubber development be brought into Jasco and its licensing and exploitation there controlled by I. G.

The four-party agreement.—By another of the basic agreements of November 9, 1929 (exhibit 8), it was I. G.'s turn to renounce to Standard the oil industry—outside of Germany. I. G. assigned and agreed to assign to a patent licensing company the exclusive rights to all of I. G.'s present and future patents useful for the production of major products of the oil industry—but only to the extent of and for the purposes of their use in the oil industry. I. G. also agreed to furnish all of its present and future information or know how for use in these processes of the oil industry, and Standard agreed to do likewise for I. G. for its oil operations in Germany.

The licensing company, called S.-I. G., was created as a Delaware corporation; 80 percent of its stock was issued to Standard and 20 percent to I. G. The rights in the company were governed, however, principally by the November 9, 1929, agreement and not by the stock interest. Each party had the right as stockholder only to receive its proportionate share in $11,000 of S.-I. G. net income and to enjoy a stockholder's voice in management. Management, however, as well as Standard's control by its ownership of 80 percent of the stock, was limited by the agreement.

As stated above, I. G. reserved to itself in all cases exclusive enjoyment and power of disposal of all rights in the patents in question for all purposes outside of the oil industry. To this end the agreement set up an elaborate definition of the hydrocarbon field. The example cited in the text of the agreement stated that

Digitized by Google

thus the pooled processes could be used "for the production of aromatic hydrocarbons and methanol * * * so far as these products are used as antiknock substances or as motor fuel. They do not come within the field when intended for use as raw materials for dyestuffs and explosives in the case of the aromatic hydrocarbons, or as solvents in the case of methanol" (exhibit 9).

The fact that the above agreement serves the commercial purposes of the division of fields agreement, rather than carrying out merely a patent acquisition, is further emphasized by its provision for future border-line cases. Standard and I. G. recognized that the definition of the hydrocarbon field might not be adequate to cover all situations that might arise, and that future processes might produce products falling both within and without the field. It was agreed that new allocations would be negotiated consistently within the spirit of the agreement. Here again the agreement covered not only processes and products already patented, but also new future developments of the parties.

Under the agreement S.-I. G. was the recipient not only of all of I. G.'s hydrocarbon field processes, but also of all of Standard's hydrogenation processes. Standard assigned these to S.-I. G. exclusively, for the world, outside of Germany, reserving to itself only operating rights. The hydrogenation patents of both Standard and I. G. for all purposes of the hydrocarbon field, but for those only, were thus combined in S.-I. G.

Standard transferred to I. G. 546,000 shares of its stock valued at approximately $35,000,000, upon the execution of these agreements (exhibit 10). The impression may exist that Standard paid this $35,000,000 for I. G.'s hydrogenation rights. In fact what it obtained, by this payment and by its numerous commitments with I. G., was its position under the agreements. Standard surrendered its freedom of action in the chemical industry but received protection from any competition with it by I. G. or any potential licensee of I. G. in the oil industry. It also obtained an immense advantage over competitors in the oil industry by having the patent and technical resources of the two great organizations joined in partnership

By the agreement, S.-I. G. bound itself to do no other business save that of granting licenses under patents coming within the hydrocarbon field, assigned to it by Standard or I. G. It bound itself to grant such licenses only in consideration of substantial royalties. Out of these royalties received, S.-I. G. was required to pay I. G. 20 percent of the gross (or, in the case of running royalties from hydrogenation, 2 cents per barrel when oil was used as the starting base and 3 cents per barrel when coal base was utilized) The net balance of royalties, after $11,000 in income paid to S-I. G., was payable to Standard. Standard itself, in spite of its payment of $35,000,000 for proprietorship of I. G.'s processes and an 80 percent share in the royalties, had to continue to pay running royalties for their use.

One result of this arrangement, which Standard used to the fullest advantage in its patent pool negotiations with other oil companies, was that, whereas Standard itself appeared to take licenses under S.-I. G. patents as any other licensee, Standard in fact received a rebate of approximately 80 percent of the royalties paid by it. This rebate, as well as its share and I. G.'s share in royalty collections from other licensees, were concealed from the industry. We shall see that Standard consistently kept secret not only its preponderant share in rayalties from I. G. patents, but also the very fact that Standard held the control of all of I. G.'s patents in the oil industry.

We have then, in large lines, a division of the chemical and oil industries between Standard and I. G., with the commitment for intimate combination and cooperation with each other in enhancement of their joint interests so divided. We have seen, however, that Germany was set apart. In Germany, I. G.'s freedom of action was in no way restricted. In passing, we may observe that this respect for national development was not reciprocal. Standard was not saved the like freedom of action in the United States. Standard's renunciation of its future freedom of action in the chemical industry was world-wide, including the United States.

German sales agreement.—There remained, however, Germany. Both Standard and I. G. were in the oil business in Germany. I. G. produced oil products synthetically. Standard refined some products in Germany and exported to Germany, and marketed there through its distributing system large quantities of oil products. Without an agreement covering these circumstances the two powers would not have ruled out for all cases the possibility of unrestrained competition. The union would then not be perfect. Furthermore, I. G. desired

Digitized by Google

a distributing organization at its disposal to give it an outlet in Germany for its synthetic production.

In answer to these needs we find the third of the four agreements (exhibit 11), called the German sales agreement. It presented a solution protecting each party, opening to I. G. an outlet for production and preserving to Standard its profit. I. G. agreed to deliver to Standard all of its production of gasoline by hydrogenation, to be marketed by Standard. Standard agreed to take and market all of such production by I. G. I. G. also agreed to favor Standard in all purchases of such imported crude oil as it should require. Thus the world-wide measure of common interest was filled out.

Coordination agreement.—It would seem that this was enough. There was, however, a fourth agreement (exhibit 12), already introduced before this committee, called the coordination agreement. In the language of high diplomacy and with the suggestion of a reliance upon a private law above the law, this agreement embodies mutual assurance by the parties to each other that they would voluntarily readjust their contracts to carry out their purposes in the event any obstacles were presented by existing or future law, act of governmental authority, or circumstance. This is only the barest effort to state the gist of the agreement, whose actual terms are next to impossible either to summarize or to characterize. That is best left to the text itself.

Let us add only the observation that thus in the basic constitution the parties asked and received cooperative assurances beyond the fixed terms of their contracts. Behind each of the patent agreements lies this indefinite and anomalous undertaking. Nor was the coordination agreement an isolated incident of 1929. Its terms were in existence as early as 1926. In connection with a particular patent agreement, that for hydrocarbon synthesis, it was reaffrmed as recently as October 1940.

The hydrogenation agreement of 1927.—It should be pointed out that by agreement of September 27, 1927, Standard had already acquired the right to license under I. G.'s American patents for the hydrogenation of oil (exhibit 13). What was added by the 1929 agreements was that Standard acquired proprietorship of the patents, that it acquired them for the whole world outside of Germany, that hydrogenation of coal—which has never been licensed or offered here—was added, and that Standard obtained the general agreements for suppression of competition between it and I. G. or I. G.'s potential licensees.

THE HYDROGENATION PROCESS

Having first looked at the full scope of the industry-wide agreements made between Standard and I. G. in 1929, let us now look at the hydrogenation process itself, what it was, and how it has been controlled.

Essentially, hydrogenation constitutes the subjection of hydrocarbons to heat and pressure in the presence of free hydrogen. In the reaction heavy hydrocarbons, such as coal and crude oil, combining many carbon atoms in the molecule, are broken into lighter hydrocarbons combining fewer carbon atoms in the molecule, and additional hydrogen atoms are introduced into these lighter hydrocarbons, and, as a result, products such as gasoline, more valuable than the starting material, can be manufactured. Catalysts of various types, such as nickel or aluminum compounds, facilitate the reaction, lower the necessary heat or temperature, or help determine the desired final product. Many of the patents developed for the process relate to the composition or method of use of the catalysts.

Hydrogenation, under the definitions of the agreements with I. G., also includes the combination of free hydrogen with carbonic oxide gases containing no hydrogen to form light hydrocarbons. This operation was later made the subject of an entirely separate pool, called hydrocarbon synthesis.

Use of hydrogen together with heat and pressure, with or without catalysts, was in later years found to have extremely beneficial effects in many refinery operations regardless that, contrary to the case of the original hydrogenation process, these later operations did not add free hydrogen to the final product. Hydrogenation thus led to many important modern processes simply by education in the use of hydrogen, heat, pressure, catalysts, or the several combinations of these factors. Among such developments were some of the modern methods for producing high octane gasoline, toluol for TNT, and butadiene for synthetic rubber. Developments throughout the field have been influenced by the hydrogenation agreements.

Digitized by Google

It is clear that the original importance of hydrogenation itself was this: The process was capable of converting coal into gasoline or any other oil products. It was also capable of converting crude oil directly into gasoline, 100 percent by volume, and of producing high-grade oil products from low-grade crude. It was the only process then feasible for carrying out these operations in all stages to the final product. It has unknown potentialities for the future. Its acquisition meant life insurance to Standard against depletion of crude. It meant protection to Standard against promotion of synthetic production by I. G. or licensees under I. G.'s processes as then existing or as might be thereafter developed. It meant protection to Standard against ventures into synthetic production in foreign countries where Standard marketed, by nationalistic governments seeking self sufficiency. It was acquired for these purposes and therefore at the outset is an example of the large scale use of patents for discouragement, and not encouragement, of practice of the inventions.

Hydrogenation had been discovered before I. G.'s developments. The basic principle was evolved before the last war by a German professor named Bergius, and patents had been taken out all over the world. After the war they were held in this country by the Chemical Foundation, transferee of the Alien Property Custodian. Abroad they were held by International Bergin Co., the controlling interests in which were held by I. G., Shell, and Imperial Chemical Industries (called I. C. I.) through various international shadow corporations such as Atlantic Binger Company and Makot (exhibit 13a). After the war I. G. developed numerous process, appliance, and catalyst patents covering the practice of hydrogenation and application of its principles, so that I. G.'s patents were necessary for practical use of the process. In this country, the Bergius patents were disregarded until suit was brought against Standard by the Chemical Foundation in 1935. It was settled by Standard in 1937 by the payment of $100,000 (exhibit 14). Abroad, however, Standard made sure to bring in all the Makot interests and thus to obtain control of the foreign Bergius patents from the beginning.

The patent story unfolding from the basic Standard-I. G. agreements now spreads into three classifications: (1) Hydrogenation in the United States; (2) hydrogenation abroad; and (3) subsequent oil patent pools.

Hydrogenation in the United States.—We have seen that, by the basic agreements with I. G., Standard acquired control of methods for synthetic manufacture of oil products. Nothing in the agreements committed Standard to license hydrogenation. However, Standard established a plan in the United States by which 18 major American oil companies received the right to hydrogenation licenses (exhibit 15). The plan adopted spread in this country the use restrictions of the I. G. agreements to cover the future operations of all these companies, and prevent development of hydrogenation for chemical purposes by the oil industry. It also obtained for Standard and I. G. all present and future developments in the field by the American oil industry. Frank A. Howard, in a letter to the Standard Oil Co. of California on May 26, 1930, summed up the plan of S.-I. G. in regards to the hydrogenation process in the United States by saying:

"In a few words, therefore, it seems to cover the oil business proper, present and future" (exhibit 16).

There is no question that Mr. Howard was counting upon the dominant position held by Standard Oil Co. (New Jersey) in the oil business to carry the plan through the initial stage because on January 27, 1930, he wrote to E. M. Clark of Standard Development:

"Kingsbury [Standard Oil of California] and Sutro arrived this morning and I had a brief discussion with them about the U. S. plan. The upshot of it is this: Kingsbury says frankly that he thinks the plan rather tough on him since, if used on a very large scale, it will result in very large royalty payments, the extent of which he cannot estimate at the present time, but that, in view of the potentialities of the process, he cannot justify staying out and therefore expects to come in. He says he believes that, if the other people speak with equal frankness, they will tell the same story and I think he is exactly right. All of these great companies are going to kick like steers at the prospect of paying any substantial running royalties. If they knew as much as we do about the prospects of the process replacing present cracking entirely, they might buck even more. My hope is, however, that they will all feel just as Kingsbury does, i. e., that they cannot afford to be left out" (exhibit 17).

Mr. Henry L. Doherty, president of Cities Service, wired to Mr. Howard after he had considered the plan:

Digitized by Google

"I would rather lose $26,000 however than fail to be cooperative with the Standard of N. J." (exhibit 18).

The sum of $26,000 represented the cost to Cities Service for preliminary participation.

Standard fromed the Hydro Patents Co., called H. P., as the licensing company to administer the United States hydrogenation patents. Standard selected 18 major American oil companies to take shares in H. P. and licenses from it. Standard formulated a series of agreements between S.-I. G., H. P., other corporations created for the purpose, and the prospective stockholders and licensees. These agreements severely limited the rights conferred by the licenses and by the share interests and burdened them with obligations. The amounts of stock to which the oil companies were invited to subscribe were made proportional to the amount of prospective crude oil refining by the respective companies.

The invitations described the offered processes as revolutionary in nature and in capacity and emphasized that they represented the combined technical resources of I. G. Farben and Standard Oil Co. of New Jersey. They presented the alternative that the companies make the large capital contribution required by the plan in order to join or turn down the invitation and be exposed to the much larger royalties that might be charged outsiders (exhibit 19). The minimum payment for this purpose was $238,500; the amount was larger for the larger companies.

With little specific information on the process, its performance, and its patents, most of the companies accepted in the face of this alternative (exhibit 20). Afterwards, after their signature and initial capital contribution had been obtained, the large capital outlay required by the plan for retention of the original investment and the right to stay in, was, on great outcry by the oil companies, written down (exhibit 21).

There are many things to mention about the plan (exhibit 15). To cover the ground, let us take a few in rapid succession:

(a) Though hydrogenation of coal was included, only oil companies were invited to participate;

(b) Though S.-I. G. held also the rights for hydrogenation of gases, that was kept out of this pool and saved for a separate arrangement;

(c) All of the required capital contributions except a nominal amount were payable to S.-I. G.;

(d) The high running royalties also to be paid by stockholders for practice of the process were likewise payable over to S.-I. G.:

(e) The only source of profit to stockholders would be licenses to outsiders, and in such case only out of any excess charges above the large regular rate to be paid by them to H. P. and by it paid over to S.-I. G; and

(f) Standard had the right to buy shares at a nominal rate, and it did so to the extent of 40 per cent of the stock issue of the company. Standard, of course, had, through S.-I. G., roughly 80 percent interest in royalties paid by others or by itself.

Members and licensees were required to enter into a separate agreement with a new company, Hydro Engineering & Chemical Co. [called Engineering], formed by Standard for the purpose and owned by it. By this separate agreement licensees were required to call on Engineering to review all their plans and specifications for construction of their hydrogenation plants. For this service licensees were required to pay Engineering 4 percent of the capital cost of the plants. Furthermore, though required to cross-license their own catalyst patents to Engineering, and furnish it all their information on catalysts, licensees were forbidden use of the hydrogenation patents for manufacture of catalysts until 1938. Thus to operate the licensed process they were in practical result compelled to buy their catalysts from Standard's Engineering.

The licensees objected strenuously to the formation of Engineering and the requirement that all catalysts must be purchased from it.

Mr. Dearborn of the Texas Co. wrote to Frank Howard:

"To require a licensee to contract with H. E. (Engineering) is a drastic requirement of which the government would likely complain. * * * The whole scheme of making it a condition precedent to the grant of a license by Hydro-Patents, that the licensed company shall contract with Hydro-Engineering seems to restrict development rather than encourage and promote it. The greatest possible advance in the development of the process will certainly result in independent action" (exhibit 22).

Digitized by Google

Standard Oil of Indiana also objected vigorously to Engineering. It wrote: " * * * The long term of this contract, the large engineering fee charged, regardless of whether Hydro-Engineering's services are needed or not, and the onerous limitations on the rights of the companies to manufacture even their own catalysts, are certain to be a source of serious irritation and dispute" (exhibit 23).

E. M. Clark of Development replied to this criticism:

"The right to manufacture patented catalysts is not to be given to the licensees of Hydro-Patents. That exclusive right will be granted to Hydro-Engineering. The licensees of Hydro-Patents, however, will be given a right to use such patented catalysts. As to unpatented catalysts, there will be nothing in these agreements which will obligate a licensee to purchase them from Hydro-Engineering" (exhibit 24).

But Indiana was not satisfied with Mr. Clark's explanation regarding the manufacture of catalysts. It answered his letter by pointing out:

"Without reopening the whole matter, I want to call your attention to the fact that your letter does not discuss the inequitable situation mentioned in * * * my letter. If a new catalyst were developed by a licensee he would, under your interpretation of these provisions, have a perfect right to make it himself as long as he did not patent it. But the minute he applied for or obtained a patent he would have to assign the patent to Hydro-Patents and thereby lose the right to make his own catalyst. This would tend to promote the development of secret processes for catalyst manufacture" (exhibit 25).

Indiana again criticized the plan in January 1932. After stating that the monopoly thus set up would extend over many years, it said:

"It is rather apparent that a majority of the refining capacity would be favorably persuaded toward purchasing its catalysts from H. E. Whether this is such a combination of purchasing power as might be attached is not free from doubt" (exhibit 26).

The criticism of Indiana caused Standard considerable worry because a conference was held with its attorneys to consider Indiana's objections. At this conference—

"Mr. Davis and Mr. Neave agreed that since under the terms of the contract the licensees would themselves have the right to manufacture catalysts at the expiration of the reasonably short introductory period there could be no objection to the contracts from the standpoint of the Anti-Trust Law" (exhibit 27).

This "reasonably short introductory period" referred to was 8 years. That period, during all of which Engineering alone would have manufacturing rights under all patents of the group, assured to Engineering a dominant position in catalyst preparation.

The hydrogenation plan established an elaborate network of cross-licensing. Licensees were required to cross-license, royalty free, all their present and future patents falling within the broad definition of hydrogenation. Though they received licenses only under American patents, this requirement compelled them also to cross-license their present and future foreign patents. In the United States, these cross-licenses ran to the licensees of H. P. Thus Standard and I. G. won the power to charge royalties on all discoveries that might be made by others in the field, even though they should become the most important contributions to the process. Standard itself, alone among the members or licensees, won the opportunity to use all such discoveries of other American companies royalty free except for the share of royalty it was required to pay to I. G. In other words, even if American inventions in this field should supplant the German ones, Standard should continue to pay royalties to I. G. but none to the American inventors. It should seem obvious that incentive was frozen.

Outside of the United States, royalty free cross-licenses ran to Standard's foreign licensing company. Of this, none of the American companies were members—except, as to the Shell system, more later. In Germany, the royalty free cross-licenses ran to I. G.

Members and licensees were required to furnish all their present and future information and experience in the field of hydrogenation for disclosure to all those entitled to licenses.

The broad definition of the hydrocarbon field used in the Standard-I. G. four party agreement was carried bodily into the hydrogenation plan—except that the treatment of gases was eliminated. (That subject was saved for a separate

Digitized by Google

agreement.) The hydrocarbon field definition was tied to the definition of hydrogenation. The cross-licensing and exchange of experience provisions were built within the shell of this definition.

Mr. Howard E. Cole, of the Standard Oil Co. of New York wrote to Mr. Howard in May 1930 that he considered the definition of hydrogenation much too broad. To this, Howard replied:

"The definition of the term "hydrogenation process" is not an effort to define the scope of any patents which we own, but rather an effort at defining the field of our present and future inventions within which field all parties must cross-license one another" (exhibit 28).

Mr. Howard thus admits his purpose in defining the hydrogenation process broadly in the agreements was to include any future developments and therefore preclude any possible future competition. The Texas Co. characterized the excessive drag net effect of the definition, in a letter by R. C. Holmes, president, to Mr. Teagle, in June 1930, as follows:

"The definition of the hydrogenation process is broad enough to include not only improvements but also *radically new processes* invented or acquired by the licensee and the license contract is subject to an onerous cross licensing provision" (exhibit 29).

The criticism of Mr. E. W. Isom vice president of Sinclair Refining Co., caused Mr. Howard concern. In a 17-page letter, Mr. Isom discussed the whole scope of the plan from the standpoint of antitrust legislation, to which Mr. Howard replied:

"The field of the plan is criticized as broader than any patent monopoly. By field of the plan, I assume you mean the definition of the hydrogenation process. This is not an effort to define the field of any monopoly—it is merely an effort to say what the process licensed is so that a licensee may know three things: (*a*) Within what range he is free to operate the invention of the various patents, * * * (*b*) to fix the boundary of future inventions of I. G. and Standard to which H. P. becomes entitled to obtain the exclusive licensing rights. * * * (*c*) to define the field of the cross-licenses. The cross-licenses are, of course, for the same field as the direct licenses. The definition of the field of the first is, therefore, automatically a definition of the field of the second" (exhibit 30).

The above explanation, however, did not free Mr. Howard's mind of the criticisms advanced by Mr. Isom because he ended with:

"Frankly, I am very much troubled by your criticism of this point of the breadth of the plan and your statement that it is broader than any patent monopoly. This is exactly the same kind of criticism which was made by the Government in the cracking case of the definitions of the processes there adopted. I was never able to follow their reasoning at that time nor after all the proofs were in was I any better able to follow it. There was no assumption in the cracking case and there is no assurance at the present time that the fields are broadly covered by any patent or patents. I am beginning to think that I must have a blind spot on this question for I utterly fail to follow your reasoning or to find any clue to your statement that because we define the hydrogenation process as the field of the plan we are representing that we own patent rights which cover all things which might come within that definition."

Thus, the definition upon which cross-licenses were required and future inventions tied up was much broader than the actual patents held by S.-I. G. In consequence, no matter what or whose inventions might be made within the broad field defined, Standard would have the right to use them at approximately 20 percent of the royalties paid by others. Indeed, Standard would pay royalties only to I. G. On the other hand, whatever or whosoever the future inventions, others would pay royalties to be divided, 80 percent to Standard and 20 percent to I. G. Standard thus established by contract a fixed economic advantage in synthetic gasoline production, good to last far into the future by force of the agreements.

At the same time that the definition of the broad field covered by the plan specified the kinds of patents that were to be licensed and that must be cross-licensed, it also specified the uses that could be made of the patents so licensed. None of the patents covered were licensed for general use, but only for the operations defined, for manufacture of the products specified, or of products to be used for the purposes specified. In this manner the definition prevented use of any of the pooled processes or experience for purposes of the chemical industry. R. J. Dearborn, of the Texas Co., protested against this limitation.

Digitized by Google

This would be a disadvantage, he thought, to a licensee if coal was being used as a base because he would necessarily make valuable chemical substances.

"It seems economically wrong to restrict a licensee from selling any product which is a direct result of the hydrogenation process under which he is licensed" (exhibit 22).

Thus the pattern of the four-party agreement and the division of fields agreement between Standard and I. G. was placed upon the use and development of hydrogenation in the United States by the American oil industry. In shocking contrast, it appears that the agreement placed no restrictions at all on the use that I. G. might make of the hydrogenation inventions and experience flowing to I. G. from the American oil companies under the cross-licensing and exchange of experience requirements.

We see then that, among the fruits of its joinder with I. G., Standard acquired a practical monopoly of synthetic processes of revolutionary potentialities. It promoted an industry-wide pool in a form which perpetuated Standard's economic advantage and dominance over all present and future developments of processes of that general character. In faithful subservience to its undertaking to I. G. to partition the industry, Standard thus fostered a comprehensive plan which removed the oil industry from general development of the processes for any purpose of manufacture of chemical products.

Manifestly, this instance presents at least four important problems for the committee's consideration:

(1) Whether compulsory licensing of patents and reasonable royalty rates should be generally required. With such a requirement there would be no opportunity to compel acceptance of terms such as we see here; but of course it would be extremely difficult to arrive at the measure of reasonable compensation. Some discoveries cost millions either for the discovery or for development. Discoveries differ in novelty, utility, and the money value of the products to which they apply.

(2) Whether there should be public registration of licensing agreements such as the hydrogenation plan. That agreement was made in 1930. Only now has it been investigated.

(3) Whether use restrictions should not be specifically regulated. Their proper purpose is to save to the patent owner the opportunity to exploit the patent exclusively except for the purposes he is willing to license it, and to enable a licensee to get a cheaper license where he desires to make only a limited use of the patent. But where use restrictions become part of a general plan we see that they serve as a method of partitioning an industry. Where they appear in a patent pool they limit general development by industry.

(4) Whether contracts requiring cross-license of future patents should be regulated or limited. Of course, the basic justification of the cross-license of future patents is to prevent the licensee from impairing the value of the licensor's patents by acquiring improvement patents and withholding them from the licensor. We see that the device has now grown into blanket cross-licensing requirements, making the licensor's patent position self-perpetuating.

Although these practices may have their justification in particular cases, it now seems clear that the point has been reached where the hardship that a change in the law might work in individual instances is offset by the general purpose to be served. Of course, the problem presented is not at all that of the individual inventor, though the effect that any legislation may have upon him must be considered. The problem is that of the manner in which aggregated corporate wealth is used in exploitation of scientific development under its control.

Hydrogenation abroad.—Now we turn to the rest of the world. The system that Standard elaborated for management of foreign hydrogenation patents is of interest for two reasons, (1) because it is a striking instance of frank and direct use of patents in protection of market position, and (2) because it shows that the patent structure abroad and at home were knit together and governed interdependently as a world-wide system. All of the parts served the system, and the system served to consolidate industrial and commercial position. (I introduce exhibit 31, embodying the international hydrogenation plan of February 16, 1931, and separate agreements with Imperial Chemical Industries, Ltd., dated April 10, 1931.)

By this international hydrogenation plan no pool of general membership was formed, though the possibility of later taking in members in particular countries was provided for. In the beginning Standard took in one partner, its peer as an

Digitized by Google

international oil company, the Royal Dutch-Shell system. Shell was sold a half interest. Special position was given in the British Empire to I. C. I. Both of these companies held important interests in International Bergin Co., holder of the foreign Bergius patents. By the deal made, these interests were consolidated with those of Standard and I. G., and the foreign Bergius patents were thus brought under control (exhibit 32).

Before scanning the structure of the international hydrogenation plan itself let us look to the reasons leading to the Standard-Shell partnership under which the plan was operated. Manifestly, interest in the Bergius patents was not alone enough to win full partnership, as witness the failure to give I. C. I. other than a limited position, and the failure in this country to give the Chemical Foundation any position at all. The reasons were two: Shell's own relations with I. G., under which I. G. had insisted that Standard must bring in Shell (exhibit 33); second, Shell's commercial position in world markets, in respect of which the hydrogenation plan represented an incident of cartelized commercial truce.

In the 1920's Shell too had been dickering with I. G. for hydrogenation, and had been exploring a general alliance. Shell and Standard were both large oil operators in Germany and I. G. was interested in peace—on terms. Shell was not a suitable partner for a complete marriage, for Shell already had certain chemical interests directly related to hydrogenation in Shell's manufacture of nitrogen and fertilizer. This is well brought out in a memorandum prepared by Frank A. Howard in April 1933:

"Chemical field: This relates to the so-called 'Division of Fields' agreement between us and I. G. The matter divides itself geographically into Germany and the world outside of Germany, and again divides functionally under chemical developments based on oil and natural gas as raw materials, and chemical developments not based on these raw materials.

"The theory of the agreement was that the two parties, I. G. and Standard Oil, were engaged in industries which fundamentally were noncompetitive, and that they could, therefore, keep peace with one another by each surrendering to the other control of any of their excursions into the territory of the other and arranging for joint exploitation of developments which lay on the border line. A part of this border-line field has been covered by Jasco includes such developments as the fatty acids and rubber. If these things ever get out of the experimental stage and on their feet as paying propositions it would be feasible to admit Shell into participation in them. It would be very difficult indeed, however, for Shell to swallow the broad principle of keeping out of the chemical business. They are already in fertilizer manufacturing in Holland and in the United States, and they have been quite active in other lines of chemical development, mainly but not entirely based on oil and natural gas. There is no doubt that it would be a constructive thing to do for them to come into this deal with us and I. G., but I have never had any indication that they would swallow the broad principle, and in addition I have never seen a clear road which would prevent us from getting ensnarled in misunderstandings with them unless we adopted the broadest possible line of merging our research and development work with theirs in effect" (exhibit 34).

However, as stated above, I. G. did not wish to make a deal with Standard that would exclude Shell. Standard at length won acceptance for a formula upon which Standard should make the deal with I. G.—I quote from a letter written by Mr. von Riedemann, Standard's foreign representative, to Mr. Farish:

"As you are not familiar with the early history of this whole situation, I might explain that when we got interested in the I. G.'s hydrogenation process, the Shell sat up and took notice, with the result that Kessler had several discussions with the I. G. In order to prevent the I. G. trading one against the other, we suggested to the Shell as a solution that we trade for the process, with the understanding that we should offer them a participation if it came to a contract" (exhibit 35).

Standard was to deal with I. G. on a basis covering the whole of the oil and chemical industries, making Standard and I. G. partners with their special interests allocated between them, and thereafter Standard would take in Shell on an equal basis as to hydrogenation. Upon this formula Standard and I. G. executed their basic agreements. Afterward there was some confusion as to the extent of Shell's equal interest. According to Shell it was supposed to be an equal partnership world-wide (exhibit 36). According to Standard it was supposed to be world-wide outside of the United States, but in the United States

Digitized by Google

Shell should come in as any other member of H. P.—which of course was no equal position at all. Standard held to its point, and Shell came into I. H. P. and agreed that Shell Union Oil Co. of California should come into H. P. as an ordinary member. Of course the settlement was not free. Shell agreed to the price $10,500,000—$7,500,000 of this in cash and $3,000,000 payable from royalties (exhibit 37).

The settlement with Shell was not, however, wholly satisfactory (exhibit 38). In the first place, Shell took no place at all in the general oil patent pool between Standard and I. G., but only in hydrogenation. In the second place, Shell was not fully tied in as to hydrogenation in the United States. The membership of Shell Union in H. P. was not a basis for full technical cooperation, since the parties were not equal all over the world. The failure to effect complete reconciliation for a long time remained a stumbling block to cooperation as to new developments.

The significance of the international hydrogenation plan as either a cause or a symptom of commercial truce between Standard and Shell in the world oil markets outside of the United States appears in the terms of the plan. The full details of the commercial relationship between Standard and Shell could not be ascertained from our investigation, but the correspondence repeatedly refers in terms to an over-all written understanding governing the world marketing relations of the companies (exhibit 39). Their cooperation is emphatically illustrated in their unanimity of policy in the face of political demands of such foreign governments as France, Germany, Italy, Spain, Hungary, and Japan (exhibit 40).

The foreign hydrogenation licensing system established by the series of agreements contained counterparts of all the features we have observed in the American system. A Liechtenstein corporation was formed under the name International Hydro Patents Co. (called I. H. P.), to receive, hold, and license foreign hydrogenation patent rights, that is, to perform the function abroad of H. P. here. There was this exception—that whereas Standard was the principal beneficiary of H. P., Standard and Shell were coowners of I. H. P. both by stock interest and by the terms of the agreement. There was an International Hydro Engineering Co., the counterpart abroad of Engineering at home, in like manner serving as a complete intelligence service over hydrogenation plant construction and operation, as a device for a capital levy of 4 percent upon all construction, and as a center of control over catalyst manufacture and development. Under I. H. P. and International Engineering the like cross-licensing network bringing into the system all present and future inventions of licensees was set up. There were the same provisions for cooperation by all in maintaining and acquiring patents for the system. There were the identical limitations against uses of hydrogenation for chemical purposes, thus extending abroad the scheme within which the use and development of the world-wide pool of patents and technique relating to hydrogenation were restricted to the oil industry, leaving its enjoyment for chemical purposes to I. G. alone.

The whole network was tied together with the American system by a series of agreements between the various corporate entities employed in the two systems, including Bataafsche, International Co. of Vaduz, I. H. P., S.-I. G., H. P., International Engineering, and American Engineering. Cross-licenses, agreements to exchange information within the system but not to develop it outside, assumption of obligations as to the terms upon which licenses could be granted in America or abroad—all assured that hydrogenation rights and technical information would flow within the system and not go out of it. In Germany, of course, I. G. was the exclusive recipient of rights and experience from the system.

These were the likenesses of the I. H. P. plan to the H. P. plan. There were also differences. The foreign licensing plan related the patents directly and specifically to protection of markets.

The foreign licensing plan falls into two divisions, that for hydrogenation of oil, and that for hydrogenation of coal. For hydrogenation of oil, Standard and Shell were given unrestricted right to licenses. Licenses were not, however, to be offered to the remainder of the industry if the effect would disturb marketing position, or, as it was termed in the agreement, the "'As is' position." This expression, used to adapt patents to markets, was defined in detail. In brief it meant the marketing position of respective companies in respective countries as enjoyed in the year 1928.

Custody of the marketing positions of the oil companies of the world as they might be affected by hydrogenation was allocated between Standard and Shell.

Digitized by Google

The world was divided into 2 halves—American companies, over whose "'As is' position" Standard was given custody, and non-American companies, handed to Shell. By definition, Russia was neither American nor non-American. Anglo-Iranian Oil Co., Ltd., was provided a special position. The agreement provided that either Standard or Shell could request licenses for other companies, but Shell could not require licenses that would impair the "As is position" of any American company, and Standard could not require licenses that would impair the "'As is' position" of any non-American company. The definition as to Russia had the effect that the marketing position of any Russian company was not an object of protection and its disturbance was no impediment to grant of a license.

For coal hydrogenation, licenses could not be granted either to Standard, Shell, or any other company to a capacity in any country in excess of such company's "'As is' position." Standard was given the privilege to write the terms of coal hydrogenation licenses to American companies, Shell was given the privilege as to non-American companies. Without the consent of both, coal hydrogenation licenses could not issue to Russia unless it agreed to deliver its entire production under the licenses to nominees of Standard and Shell to be marketed by them and the profits shared between the marketers in proportion to "'As is' position" where marketed. Anglo-Iranian was similarly restricted except in countries where it should come in as a partner.

The special agreement by which I. C. I. was brought in presents both one of the cornerstones of I. H. P.'s foundation and an instance of I. H. P. in operation. I. C. I. was granted a license within the British Empire. The license was for hydrogenation of coal only, except for fractional amounts of oil. The license was limited to the production in each country of the Empire of not more than 25 percent of the current consumption of each product in that country. The agreement blandly recited that this restriction should not be "understood as an expression of intention on the part of I. H. P. to limit in any way the total production of oil from coal by the hydrogenation process in the Empire." If no others beside I. C. I. should build plants, the limitation on I. C. I. obviously would stand as a restriction of total production, and this is true in spite of certain further concessions made to I. C. I. in this event.

On its part, I. H. P. warranted that no other licenses for hydrogenation of coal had been granted in the British Empire, and that no other licenses would be granted in excess of 75 percent of the current consumption of oil products in each country. Thus for the largest British chemical industry its reserved space in the synthetic oil production industry was both fixed and guaranteed. The usual ties into the system by cross-licensing requirements were included in the license. On the subject of catalysts the language is as follows:

"All licensees of I. H. P. (including I. C. I.) shall be required to purchase their catalysts from I. H. P. or its nominee" (exhibit 31).

Many other undertakings were included in the deal with I. C. I. Originally they were all drafted as provisions of the license itself. As executed, however, the other commercial aspects of the agreement were made the subject of a separate instrument entitled "Commercial agreement," bearing the same date as the license, April 10, 1931. By a third agreement of the same date the two were made interdependent. I. C. I. was required by the commercial agreement to deliver all the hydrogenation production to nominees of Standard and Shell to be marketed by them in proportions specified by them. We have seen by the I. H. P. agreement that these proportions were governed by "'As Is' Position." The companies agreed to pay I. C. I. its average price, and I. C. I. agreed to pay the companies the comfortable figure of 15 percent per annum on their marketing investment employed in this business. The exception was made that I. C. I. might take the orders of any British Empire government directly, but it agreed to fill them through the companies and agreed not to go into the business of distributing. Freight savings on Government orders effected through exchanges were to be credited between I. C. I. and the companies by formula. I. C. I. agreed to buy all its crude oil requirements from the companies.

The commercial agreement also included further provisions defining the effect of I. C. I.'s license. Although the license was in form royalty free, the equivalent of royalties in the form of payments for the right to technical information and experience to be supplied through the I. H. P. system was required by the commercial agreement. It is interesting to observe that these royalities were only slightly in excess of the amounts that ultimately had to be paid by the system to I. G. out of the I. C. I. license with the particular exception that the

Digitized by Google

lubricating oil fees were far higher. It was in the commercial agreement, also, that I. C. I. agreed to withhold its hydrogenation information and experience from anyone not within the I. H. P. system. An engagement special to the I. C. I. contract, apparently arising from I. C. I.'s experience in hydrogenation and from its position with reference to the Bergius patents (exhibit 32), was included in the commercial agreement, whereby I. H. P. on its part, agreed to pay to I. C. I., within limits, 10 percent of all hydrogenation royalties collected from others by I. H. P.

In this complete admixture of commercial treaty and patent licensing, serving inextricably the purposes of both, and freezing the future of the technique, the function of the patent as promotion of invention is certainly far lost. Yet it is upon such material as this that the world-wide hydrogenation system is built, into which the mould for American hydrogenation fits as a perfectly adjusted part.

Here, then, is a running picture of the comprehensive, world-wide system created for hydrogenation. It brought together all then feasible methods of synthetic production of oil products. It saved the world-wide development of the technique in the chemical industry for I. G. Farben. It brought the American oil industry into the common fold. It gave to Standard and I. G. the permanent royalty advantage in American developments in the field. It gave to Standard and Shell the world's developments for their use and control outside of the United States and Germany, subject to world-wide royalty interest of I. G. It gave the world's developments to I. G. for its exclusive enjoyment in Germany. It laid down the lines of adjustment of potential synthetic production and existing industrial and commercial position in the oil business outside the United States and Germany. Finally, it created a structure of contractual interrelationships by force of which Standard obtained a commanding position over subsequent developments in the vastly important use of hydrogen and catalysts in modern methods of manufacture of the products of petroleum.

The recent consent decree adjudged the American hydrogenation plan unlawful, and enjoined its further execution. Licensees were given the right to obtain the benefit of all provisions of the decree. Together with all other patents in S.-I. G., specifically all hydrogenation patent rights thrown by both Standard and I. G. into S.-I. G., were made subject to compulsory licensing to the public. They are royalty free for the war and subject to reasonable royalty rates thereafter. Complete know-how—that is, technical information for use of the patents—is also made available. The contracts with Hydro Engineering & Chemical Co., which were forced upon licensees, were dissolved. Use of the hydrogenation patents and processes for all purposes whatsoever, oil and chemical, was made available.

The decree had no application to I. H. P. and the international hydrogenation system. For one thing, under the exigencies of war the international agreements are far too complex in their ramifications to withhold the solution of American hydrogenation until solution of such aspects of the foreign agreements as may be judiciable in the United States. There are, of course, questions as to adequate jurisdiction here for the purpose. But principally the reason for taking no action on this subject is, aside from the existence of outside interests, that in the present change and stress and military direction of international business a court decree could not well be asked. Likewise no effort was made to deal specifically with the question of the relationship between Standard and Shell in the world oil markets.

For several years after the hydrogenation system was established, no competitive process for synthetic production appeared (exhibit 41). There was little activity on the subject in America. The Chemical Foundation's suit against Standard on the Bergius patents began in 1935 (exhibit 42) and was settled in November 1937 (exhibit 43). The American Bergius patents were then taken into the system. Only Standard and Shell built hydrogenation plants in this country. They were used for production of high quality lubricating oil and high-octane gasoline.

Standard's obligations to I. G. were pointedly characterized during this period on the occasion of the development of 100-octane aviation gasoline. In 1935 technique had not advanced to the point of making fuel of this quality available in quantity. It was not yet used commercially, and military use of it had been only experimental. Base stock of high enough octane for blending 100 was available only in fractional amounts from the hydrogenation plants of Standard and Shell. In 1935 the United States Army sought to obtain 100-octane gasoline in quantity. Standard came to the conclusion that new processes were necessary to make the program possible. It happened that at that time Standard had obtained experi-

Digitized by Google

mental results from which it saw the possibility of quantity production of 100-octane gasoline by a new adaptation of hydrogenation. A memorandum prepared by Mr. Howard, dated March 29, 1935, examined the right of Standard under its agreement to complete this technical development and hold it exclusively for the United States Army (exhibit 44). The memorandum pointed out that should this be done, thereafter, until others caught up with the development and for at least several years, the United States would have the lead over the military aviation of the rest of the world. The memorandum then pointed out that Standard had no right under its contracts with I. G. Farben to bring about this result, since under contracts it was required to disclose to I. G. all its hydrogenation developments. To comply with the wishes of the United States Army and to so serve the country's defense Standard would have to violate its contracts with I. G. In fairness to Standard, it should be said that it appears the Army was informed of the situation. The case is here stated for illustration of the restrictions of the I. G. agreements upon Standard's freedom of action in matters vitally affecting national safety.

Abroad the story of hydrogenation in this period was largely that of growing pressure by those foreign governments which were actively promoting national self-sufficiency. While I. G. in its domain was building large hydrogenation plants, chiefly at its Leuna works, in the rest of the world Standard and Shell sought to discourage governmental promotion of synthetic production. Where their hand was forced, they used their control of the process to secure the right to distribute and market the products of such enterprises. Italy brought about hydrogenation construction, and Japan was active on the subject. It is of interest that although I. G. had surrendered hydrogenation for the rest of the world, it continued to stir active interest in the subject in Japan. I. G. had retained the proprietorship of hydrogenation outside the oil industry and by that channel the Japanese received education in the process. The shadowy figures of Abe, Matsuoko, and Kurusu flit through these years. The German Economic Commission sat in Japan. It is impossible to ascertain all that transpired (exhibit 45). The Japanese armed forces were able to proceed with their own hydrogenation construction without regard for licenses. By the time of the war several Japanese firms, championed by I. G., were seeking licenses from I. H. P. In the rest of the world there were negotiations of greatest complexity and diplomacy. At first the policy of Standard's and Shell's I. H. P. was that of suppression. By 1935 the pressure of developments forced a change in policy. Let us sum up the foreign hydrogenation story with the following statement by Standard of the I. H. P. policy, dated August 20, 1935:

"I. H. P. should keep in close touch with developments in all countries where it has patents, and should be fully informed with regard to the interest being shown in hydrogrenation and the prospect of its introduction by Governments, coal, tar, lignite, shale producers, and others. It should not, however, attempt to stir up interest in countries where none exists. If the Management decides that in any country the interest in hydrogenation is serious, or that developments in such country are likely to affect I. H. P.'s position adversely, then I. H. P. should proceed to take steps necessary to protect its position, should discuss the matter actively with the interested parties, and attempt to persuade them that its process should be used. In these countries where negotiations are already pending, I. H. P. should pursue those negotiations in a way and upon conditions which are likely to secure the introduction of I. H. P.'s process if any process hydrogenation is to be used.

"Subject to the above qualifications, viz., that I. H. P. should not attempt to foment interest where none exists, I. H. P. should be put in the position of an independent patent holding and licensing company, and allowed to attempt to sell its process wherever there is serious interest in hydrogenation.

"We feel that this is the sound and far-sighted policy to be followed. We cannot, by restricting the activities of I. H. P., other than as above stated, expect to do more than retard slightly the development of coal, tar, etc., hydrogenation, and a policy of repression will in all likelihood lose to us the advantage which is inherent in our present position. On the other hand, the policy outlined above will not tend to stir up interest in hydrogenation if it does not already exist. If coal, tar, etc., hydrogenation be feasible from an economic standpoint, or if it is to be promoted for nationalistic reasons or because of some peculiar local conditions, it is better for us as oil companies to have an interest in the development, obtain therefrom such benefits as we can, and assure the distribution of the products in question through our existing marketing facilities" (exhibit 46).

SUBSEQUENT OIL PATENT POOLS

1. HYDROCARBON SYNTHESIS (OR FISCHER) PROCESS

By 1936 a competitive synthetic process had been developed (exhibit 1). Standard began to negotiate, as also did the M. W. Kellogg Co., which had worked along similar lines in this country. Standard's negotiation necessarily brought in Shell, Standard's partner in I. H. P. The proprietor of the new development, called the Fischer process, was Ruhrchemie A. G. (exhibit 2), owned by the German steel interests (exhibit 3).

Essentially, the new process consisted of a means of joining gases, namely, free hydrogen and free carbon monoxide or dioxide, to form heavier hydrocarbon of useful nature, such as lubricating oil, gasoline, other products of the oil industry or products of the chemical industry, such as synthetic fats. In Germany the gases treated had for the most part to be first obtained from coal. The value of the process was to offer another means of synthesizing oil from coal and to broaden the type and quality of products obtainable. In this country the prospects for use of the process on a commercial basis were far brighter because of the availability on a large scale of refinery gases otherwise wasted and because of supplies of coal and natural gases (exhibits 4 and 5).

Here again the basic principle was not new. It had been known long before, but its practice had not been developed. Ruhrchemie's developments owed much to Hitler's 4-year plan, in the course of which large sums of money had been thrown into work on the Fischer process because of its strategic value in Germany.

Hyrocarbon synthesis process is brought within the network.—The potentialities of this competitor of hydrogenation and the possibilities of arranging for it a similar or an affiliated licensing system were explored. In a memorandum from Paris dated February 11, 1936, Mr. Howard expressed the problem facing Standard as a result of the advent of the new process as follows (I quote from exhibit 1, which has already been introduced):

"Summarizing the present situation, therefore, we must face the fact that the I. H. P. has definitely lost its complete control over the production of synthetic oils. While it remains the most important factor in that it controls the only commercially demonstrated processes, and the only one producing a full line of liquid fuels, the combination of the Fischer process as a means of producing gasoline, and of the Pott and Uhde processes as a means of producing heavy oils, makes a very serious breach in the hitherto satisfactory control of the situation. We are, therefore, faced with the problem of what program we should adopt in the light of these changes in the situation.

"The question before us is twofold:

"(1) Are we willing to make any substantial additional investments in the acquisition of control of synthetic processes, in the hope of continuing to dominate this field, and thus guide or limit commercial developments under such processes?

"(2) Should we utilize whatever measure of control which we have over these synthetic processes at the present time to produce revenue for the I. H. P. by licensing our patents for use in connection with these synthetic processes, or should we adopt the policy of withholding licenses from the competitive processes in an effort to hamper their successful development, without regard to the direct financial loss to I. H. P. which will result from such a policy?

"The developments, both commercial and by contracts, in connection with the Fischer process, are proceeding so rapidly that every month's delay will present us with more problems of the fait accompli order which will be difficult or impossible of solution if we eventually do acquire control of this process. If we are to do anything in the way of trying to guide or restrict the development of the Fischer process outside of Germany, the time to do so is now. An appropriate opening for any discussions which we care to undertake with the Fischer people will come through the immediate necessity of deciding whether we are agreeable to licensing, for use in the Fischer process outside of Germany, certain I. G. improvements in production and purification of coal gas. Fischer has approached the I. G. for a license to use these I. G. processes in Fischer plants inside of Germany.

* * * * * * *

"One question which immediately presents itself is whether, if we buy the Fischer, Pott, and Uhde processes, we shall not find that in another year or two we have up the same question with respect to other newly developed competitive processes. The probability is that this will be true to some extent and

Digitized by Google

that any restriction or repression which we exercise over the normal growth of these synthetic processes will result in encouraging the development of competitive processes. All that can be reasonably expected is that the importance of future competitive processes will be on a descending scale, as is usually the way in the development of any new art.

"Another question is whether we can exercise any effective control over commercial developments even if we do acquire the patent rights for these competitive processes. The answer to this is very unsatisfactory. In the first place, the Fischer process is not very fully covered by patents outside of Germany, and we are bound to find an incomplete and partially ineffective patent situation in many important countries. In the second place, we already know that governmental policy will not permit us to stand in the road of national developments of this character in countries in which the probability of such developments is greatest. Lastly, our monopoly of technical information in this field is fast being lost, and this technical information as much as the patents is the basis of control of the processes. Altogether, the answer must be that our control over these competitive developments could not be effective enough to do anything more than to give us a strong preferential position for the use of the processes ourselves (which we do not especially desire as a general rule), or to use some pressure to insure cooperation between the licensee and our operation subsidiaries in the country in question.

"The last question is whether there is any expectation of our being able to acquire those competitive processes at a price consistent with the rather limited value which we must assign to our control over them in line with the above. The I. G. appear to believe that we can. It seems that without attaching any undue weight to this opinion, we are certainly not justified in assuming that nothing can be done. Therefore, we cannot by this means relieve ourselves of the necessity of discussing and weighing this situation, and endeavoring to determine, in the light of our experience in the handling of the synthetic situation to date, what policy we should now adopt in relation to these developments. It seems rather clear that we must either decide to do something towards acquiring control of the competitive developments, or put into effect a further important liberalization of our policy in the handling of the I. G. process."

At first, in early 1936, Standard's executives expressed discouragement about the prospects of controlling synthetic production of gasoline, because of the costs of maintaining control, the difficulties in the exercise of control under the pressure of nationalistic governments, and the invidiousness of monopoly (exhibit 6). Standard was hesitant to spend any substantial amount in acquisition of the process (exhibits 7 and 8). The executive committee did not, however, despair of making a deal with the Fischer interests (exhibit 9).

On December 11, 1936, Howard wrote to Teagle (I quote from exhibit 8):

"I am told in strict confidence that an understanding exists between the Anglo-Iranian Company and the British Government to the effect that Anglo-Iranian will undertake a commercial development of the Fischer process in England about the Summer of next year, making an announcement of the plan earlier if the pressure on the Government from the coal interests becomes too hard, and delaying it if they can do so. I feel that when this announcement is made in England the pressure on governments throughout the world to undertake measures for the production of synthetic gasoline from coal will be increased tremendously

"The above of course means that we must try to move our Fischer negotiations as fast as we can if we expect to have a part in this picture. In my opinion we ought to have a part in it. If we let the foreign governments proceed on a synthetic coal hydrogenation program without any cooperation on our part the outcome will be that we shall wind up in a very large proportion of our markets with the governments actively interested in the oil business in competition with us rather than in cooperation with us. I only see one answer to this problem and that is to try to cooperate with the governments from the beginning and in this way to guide their policies and investments rather than to permit them to go along unadvised in a way which will ultimately lead them to discriminate against us in one way or another as a means of working out their own national oil policies."

Howard was correct. Pressure from other governments seeking national self-sufficiency by synthetic production made it apparent that control of the Fischer process must be acquired if Standard and Shell were to be secure in continued domination of the international oil business. The policy of I. H. P.

Digitized by Google

had been to discourage synthetic production. by use of its hydrogenation process. If nevertheless, a government was determined to embark upon synthetic production, the Fischer process might now be used instead of the hydrogenation process. A typical situation was that in China (exhibits 10 and 10–A). I quote from a letter dated March 18, 1937, by W. R. Carlisle, a Standard official, to P. W. Parker of Standard-Vacuum Oil Co., a company owned 50–50 by Standard and Socony-Vacuum (exhibit 10):

"Further to my letter of March 11th, in connection with the filenote attached thereto relative to IG's proposal that their representative, Mr. von Schubert, should take the lead in all negotiations regarding hydrogenation in China, and the view expressed by the I. H. P. representatives that the "committee" in Shanghai should decide who should take the lead in each particular case, the Shell here for your information have written to their Shanghai office advising that they are definitely of the opinion that a representative of the oil companies should always be present at any of these negotiations The reason for this is that their view is that IG's interests and ours, at least for the moment, are not exactly identical, based on information they have received from their Shanghai office to the effect that their local people believe IG are to some extent trying to create the demand for a hydrogenation plant in China

"Further to the above, the Shell here have also forwarded to their people in Shanghai some additional remarks to the memorandum regarding the policy of I. H. P. and I. H. E. C., copy of which memorandum I also forwarded to you, and the gist of these are as follows:

"That in general the production of oil from coal (or tar) is uneconomic and can only be carried out with substantial duty protection. That it is clear that such antieconomic production is against the interests of the Oil Companies; that in general therefore, it is in order that the Oil Companies should try to prevent countries getting interested in uneconomic production of motor fuel. That if such action is feasible and desirable care should be taken, however, that it be made quite clear by the Oil Companies that, if nevertheless the Government should be interested in going ahead with synthetic production then the best solution is to apply the I. H. P. process rather than any other solution. That as a matter of fact, since the I. H. P. is the only company which can offer a process which has been proven on a large scale and technically fully developed, it offers the only sensible solution for a Government, once that Government have made up their minds that synthetic oil production is worth the sacrifice. That, in other words, if the Oil Companies think it feasible and desirable to start any action to prevent China from going in for synthetic motor-fuel production, they should be very careful not to get from the smoke into the fire, namely if—failing success of the Oil Companies' action—synthetic production should be carried out by competitors, e. g., Fischer, instead of under license from I. H. P."

Negotiations were difficult and prolonged (exhibits 11 and 12). This was to be expected in view of the obstacles in the way, including the frequent clash of interests among the relatively large number of parties involved, the tense international situation, the necessity for Government approval of agreements made by the German parties, and prior commitments, to say nothing of the biggest problem of all, viz, that of fitting the new process into the already terrifically complicated arrangements made for hydrogenation and other processes.

In the month after Munich, as of October 7, 1938, agreements were signed tying up the Fischer process, called by the agreements "hydro-carbon synthesis." Standard desired no publicity as to these agreements as is shown by the following quotation from a letter by Howard dated December 21, 1938 (exhibit 12–A):

"We have refrained from making any public announcements in connection with this matter, because it did not seem that there was anything to be gained by such an announcement at this time.

"You will recognize that the matter has two aspects, first, the strictly political aspect of the Fischer Process in its existing state of development. It is not at any place an economic method of producing oil, but is an active political issue in various foreign countries. There would seem to be nothing to be gained by publicizing the recent arrangements in connection with this side of the matter.

"The other aspect of the arrangement is the provision for cooperation in research to develop along the direction of utilization of unmarketable natural gas supplies. Here, also, publicity would seem undesirable, since it would stimulate competitive effort."

Digitized by Google

Hydrocarbon synthesis agreements.—The principal parties were Standard, Shell, Ruhrchemie, I. G., Farben, and Kellogg. Eleven agreements were executed (exhibits 13 through 16). They established for hydrocarbon synthesis a worldwide system similar to that which had been set up for hydrogenation (exhibit 17 and 18).

Our review of the hydrogenation system makes it unnecessary to look at the particulars of the hydrocarbon synthesis system. The latter follows a like pattern, except that control was tighter. It should be sufficient to look at certain of the differences in the new system, to observe the special protection given I. G. against the use of this new process for chemical purposes, and to see the interconnection established between it and hydrogenation.

Let us look first at the proprietorship of the new process as allocated by the agreements. In America there was one principal difference between the previous hydrogenation arrangement and that made for hydrocarbon synthesis. For the latter, no pool of general membership was formed. The partners retained entire proprietorship. The patent and technical rights for both the United States and Canada were placed in a new American corporation, the Hydrocarbon Synthesis Corporation, familiarly called U. S. A. C. signifying those countries. Its stock was issued 25 percent to Kellogg, 25 percent to Shell, and 50 percent to S. I. G. Ruhrchemie's interest was confined to royalties.

In Germany no new corporation was formed. I. G. was made the beneciary of Ruhrchemie's rights and of cross-licensed rights arising from the system.

Outside of the United States, Canada, and Germany, the patent and technical rights were placed in a new Dutch corporation, International Hydrocarbon Synthesis Corporation, called I. H. S. Its stock was issued 50 percent to Ruhrchemie, and 50 percent to I. H. P., owned by Standard and Shell. I. G. was given the right to overriding royalties.

There were numerous and extremely complicated agreements to govern the use and licensing of the patent rights and information, to create a complete cross-licensing circuit as in the case of hydrogenation, and to parcel out royalties. There were equally complicated contractual arrangements between I. H. S. and I. H. P., providing for affiliated management of the congeries of patent rights held by each and setting up a pool of royalties between them with elaborate schedules for distribution. Such adjustments were necessary because Ruhrchemie was interested in I. H. S. but not in I. H. P. Combined management of I. H. S. and I. H. P. served to centralize all processes for synthetic production of petroleum products. One provision in the I. H. S.-I. H. P. contracts stipulated that in all construction work under licenses for the practice of hydrocarbon synthesis, German construction firms would be favored and especially recommended to licensees.

Next let us see what kinds of licenses were made available by the arrangement. To carry out in this new synthetic field the old division made by Standard and I. G. in 1929, it was necesary to make new agreements directed toward that purpose since new parties were involved, not merely in the capacity of licensees but also in the capacity of proprietors.

Accordingly, the new division of uses of the hydrocarbon synthesis process followed the old lines drawn by the 1929 agreements between Standard and I. G. In Germany, all of Ruhrchemie's rights were handed over to I. G. and I. G. was permitted to practice the process thus covered for all purposes without restriction. I. G. also received in Germany rights to be cross-licensed under this system. Outside of Germany, I. G. was denied the right to any use of the process for purposes of the oil industry but was given the right to use the process for chemical purposes.

In the world outside of Germany, Standard and Shell were given unrestricted right to licenses but the character of licenses issuable to them was limited to prevent use for chemical purposes. The substance of the old 1929 definition of "the hydrocarbon field" was taken into the new agreements. Certain relaxations on the restrictions against chemical uses were made, of a nature so technical that I do not attempt to explain them, but I. G. was given the power to forestall even these relaxations.

Kellogg's position under the agreements was chiefly that of construction engineer and licensing agent interested in the business of future licensees. Kellogg was cut out of any extensive use of the process for any purpose. Outside of the United States, it was denied the right to any licenses; within the United States, it was given the right to receive licenses for use of the process only within seven

Digitized by Google

named counties in Texas, and only for the production of a maximum of 25,000 barrels per day.

Although outside the United States the licensing activities of I. H. S. and I. H. P. were coordinated by agreement, within the United States the licensing activities of H. P. and U. S. A. C. were kept wholly distinct, since, under the process definitions, the members of H. P. held no interest in dydrocarbon synthesis.

Reaffirmation of basic 1929 agreements with I. G. by Standard.—Formation of the hydrocarbon synthesis trust was the occasion of a reaffirmation by Standard of its basic agreements with I. G. It has been seen that S.-I. G. received 50 percent of the stock of U. S. A. C. However, I. G.'s interest in S.-I. G. was only 20 percent, and was therefore not an assurance to I. G. that the new pool would be so controlled as to protect I. G. in the chemical industry. Hence one of the 11 hydrocarbon synthesis contracts (exhibit 15) was in effect an amendment and reexecution by Standard and I. G. of the four-party agreement of November 9, 1929. The coordination agreement of November 9, 1929, was also specifically made applicable. Standard by this new compact conferred upon I. G. the right to nominate half of those directors of U. S. A. C. who were to be elected by vote of the stock of S.-I. G. Standard retained the right to nominate the other half of these directors.

This new agreement expressly provided that the vote of all the directors to be elected by S.-I. G. should be dominated by I. G. for purposes of the chemical industry and by Standard for purposes of the oil industry. It was thus placed in the power of I. G. to block all use of hydrocarbon synthesis in this country for the manufacture of any chemical products. Even this was apparently not enough for I. G.'s assurance. In January 1939 I. G. got from Standard a reaffirmance of the basic division of fields agreement of November 9, 1929, and also of the Jasco agreement (exhibit 19). As late as September 1940, upon a further amendment on an apparently technical matter, Standard again restated its generic relations with I. G. in further reaffirmance of these agreements (exhibits 20 and 21).

Importance of hydrocarbon synthesis.—The possibilities considered when this process was acquired are indicated in a Standard report of November 3, 1938, as follows:

"In the course of the various discussions, Keith gave some outline of the way Kellogg has been thinking about future developments. Kellogg has prepared a report on their own work and an estimate for a 4,000 B/D plant working on natural gas using assumed process data which Kellogg think would apply if certain special conditions they had in mind were fulfilled.

"This report has been written purely as a basis for criticism and has not been officially given out although Scharmann has unofficially received a copy. I have only been able to glance at it, but speaking from memory the 4,000 B/D plant is estimated to cost around $8,000,000 as compared with Development's estimate in D–202 of $6,000,000 for a 2,000 B/D plant. Gasoline cost, including fixed charges, is estimated at 3–4 cents per gallon of gasoline. Kellogg do not expect anyone to believe this but apparently they have some confidence in their own figures and the enthusiasm in the whole Kellogg group was terrific" (exhibit 24).

Mr. Howard at this time stated (I quote from exhibit 22):

"The costs of the process as so far developed are high—approximately the same as the cost of hydrogenation of coal. By using cheap natural gas as a raw material to produce the carbon monoxide and hydrogen, however, the cost according to present methods may be very greatly reduced. There is good reason to believe that still further large reductions in manufacturing costs (especially as applied to natural gas) can be effected within the next few years by further technical work along very promising lines which have already been partly proven."

The capital cost of a hydrocarbon synthesis plant appears, however, to be high, and the product must compete in this country with cheap natural products. The importance of the process thus appears to be, as in the case of hydrogenation, chiefly its potentiality in case of a crude shortage, or other change of conditions, or for supply in countries possessing no petroleum. The process is technically practicable, as witness the large plants operating it in Germany (exhibits 25 and 26). In the hands of Standard and Shell the importance of the process was that of complementing their control of hydrogenation to assure control of methods of synthetic production.

Digitized by Google

Acquisition of hydrocarbon synthesis process completes world-wide domination of synthetic production.—We have thus reviewed in outline the network of agreements under which Standard and Shell obtained complete control outside of Germany of processes for synthetic production of petroleum products. It is in itself a commentary on these uses of the patent system that one of Standard's own executives should describe the agreements covering the last acquisition, the hydrocarbon synthesis process, as follows (I quote from exhibit 11):

"The attempts which we have conscientiously made to take care of the conflicting interests of the various partners and to provide for various contingencies which may arise, gives me the feeling that if this deal is ever completed it will be so frightfully complicated that only those who have worked intimately and constantly in connection with the preparation of the documents and who have participated in the discussions will ever be able to understand it."

Mr. Howard, however, in speaking of the foreign arrangement for hydrocarbon synthesis, in his report to Standard's executive committee on October 28, 1938, expressed the result quite simply as follows (I quote from exhibit 22):

"The high points of the matter are that Jersey and Shell acquire sufficient effective control of the hydrocarbon synthesis process in the world outside of the United States so that their position as leaders in the entire field of synthetic petroleum production is assured."

It is also a general commentary on the relation between international compacts of this character and the national interest of this country that only currently has the United States Department of Justice had the opportunity to explore the hydrocarbon synthesis agreement. Only now is this committee considering it. The record shows, in striking contrast, that these agreements were never permitted by the German Government to go into effect until reviewed and specifically approved and released by that Government (exhibits 32 through 42). Indeed, the German Government went even further, as is shown by the following quotation from a letter dated June 18, 1937, by M. W. Kellogg (exhibit 43):

"I further wish to draw your attention to the fact that the Government has taken material control over all patents in Germany, to be used for the best interests of all concerned, including the Government."

It should also be added that officials of the I. G. were at this time also officials of the German Government (exhibits 44 and 45).

So far we have followed through the guardianship of synthetic production of petroleum products. Meanwhile there were agreements in the general field of oil refining. The industry operates under a mantle of patent agreements of many varying combinations of partners, subjects, and relationships, of far greater number than I can treat here. Certain of them should, however, be referred to for their further illustration of the I. G. Farben-Standard-Shell relationships.

2. GAS POLYMERIZATION PROCESSES

A new patent pool formed in 1939 by American promoters of a new process, was so utilized by Standard as to manifest in an unusual manner its service to its German patent partner. The new process provided a method of combining light hydrocarbons in gaseous form to produce heavier hydrocarbons such as gasoline. These gases are not free hydrogen and free carbon monoxide or dioxide. They are gases comprising molecules of hydrogen and carbon atoms already combined. Their combination is not exactly a synthesis of petroleum products, since the usual source of such gases is petroleum itself. Methods for polymerization, that is, this combination of the light molecules into a heavier molecule, increase refinery output by recapturing hydrocarbons that would otherwise pass off as gases and by converting them into liquid product.

Before 1935 Kellogg, Standard, the Texas Co., and Standard Oil Co. of Indiana had made progress in this new development. On September 1, 1935, these partners, together with the Phillips Petroleum Co. formed a patent pool and licensing agreement covering the process. Patent rights were placed in a new corporation named Polymerization Processes Corporation, called Polyco. At the time of the execution of the above agreement, Standard did not reveal to the other members of the pool the details of its agreement with I. G. of November 9, 1929, under which Standard received the right, through S.-I. G., to all of I. G.'s oil-refining processes, and hence to all of I. G.'s present and future patents and technique in the field subject to this agreement. This is

Digitized by Google

brought out in a memorandum prepared by W. E. Curry, Standard's patent attorney:

"If the polymerization agreement is signed with definitions which include the patent rights of Standard-I. G. Company, we must arrange to keep the patent rights of I. G. on polymerization and catalytic cracking out of the polymerization agreement. Mr. Howard suggests that this be done by a quit claim by Standard-I. G. to I. G. with respect to those inventions, then taking them up in Jasco. There would be a general understanding that the parties will agree to some equitable arrangement for securing the same effect as would have been secured under the original agreements" (exhibit 46).

Therefore, on August 12, 1935, less than a month before the agreement was executed, S.-I. G. quit-claimed back to I. G. all rights in the gas polymerization field (exhibit 47). This was done in order to prevent I. G.'s rights from passing under the agreement to the other patent-pool members.

In 1937 the shoe was on the other foot. The German Government wished to obtain Polyco processes for Germany, especially for the manufacture of aviation gasoline. I. G. called upon Standard. Standard and I. G. thereupon restored these rights to S.-I. G. By extending licenses of them to Polyco, Standard obtained for I. G. royalty-free licenses under all of Polyco's rights in Germany (exhibit 48). The result is that, although at the time of the Polyco agreement Standard had control of the American patent rights held in S.-I. G., Standard successfully prevented their flowing to the American partners in Polyco until the partners licensed I. G. royalty-free in Germany.

3. JUIK

The force of the partnership between Standard and I. G., as affecting disposition of patent rights developed by American oil companies, is illustrated by a series of developments in the field of refining of lubricating oil. These relate to a process using propane for the dewaxing, deasphalting, and solvent extraction of petroleum oil (exhibit 49).

A patent pool and licensing agreement covering the process was formed on October 2, 1933. The parties were Standard, Union Oil Co. of California, Standard Oil Co. of Indiana, and Kellogg. The agreement is called "Juik," signifying Jersey, Union, Indiana, and Kellogg (exhibit 50). At the time of the formation of this pool Standard itself had few patents in the field. It obtained its participation by force of I. G. patents that it had received through S.-I. G. (exhibit 51).

The partners exchanged licenses to their processes and agreed to divide royalties received from licenses to others. The original pool was added to from time to time by agreements including further technique and processes (exhibit 52). These additions did not relate to any necessity to bring in further patent rights in order to solve conflicts in patent processes. They were brought in merely to give the pool a more comprehensive position. As stated by Mr. Curry in a letter:

"There are at present no set patent controversies between the parties to Juik with respect to phenol as a single solvent. We cannot tell, of course, what developments might take place within the term of this agreement since all the parties are active, in solvent extraction work, *patent conflict might be expected*" (exhibit 53).

During 1935 the German Government placed pressure on German industrialists to increase lubricating-oil production (exhibit 54). Again in this case I. G. called upon Standard and expressed its desire to obtain the Juik processes.

In this case I. G. did not appear to be interested in manufacturing lubricating oils in Germany, but was greatly interested in obtaining the benefit of all Juik information and experience and in being able to grant licenses (exhibit 55). I. G. emphasized Standard's obligation under the four-party agreement to obtain licenses and exchange of experience for I. G. in Germany as result of all licenses by Standard of I. G.'s American patents. It also insisted that in the circumstances it should not be required to make any expenditure to acquire in Germany the benefit of Juik.

Standard's patent attorney, Mr. W. E. Currie, admitted that the provisions of the four-party agreement in this respect had been overlooked at the time of the Juik agreement (exhibit 56). Thereupon, Standard sought to comply with I. G.'s wishes (exhibit 57). Standard was not able at this date, however, to obtain the consent of the Union Oil Company to a free disclosure of information to I. G. (exhibit 58). As a result, Standard purchased from Juik for the sum of

Digitized by Google

$15,000 the exclusive right for Germany to the processes in question as described in the Juik agreements (exhibit 59). Thereupon, on December 15, 1938, Standard fulfilled its obligations to I. G. by transferring to it the irrevocable and exclusive right for Germany to all the Juik rights and information thus acquired (exhibit 60).

After the transaction was completed there was considerable dispute whether I. G. should remunerate Standard for the purchase. I. G. emphasized that Standard had merely fulfilled an existing obligation to I. G., but eventually, by June 1938, refunded Standard's disbursement (exhibit 61).

Standard continued to serve I. G.'s interests. In March 1940 it agreed to extend the definition of Germany to include Austria and the former territory of Czechoslovakia. It was agreed that the consideration for the further sale brought about by this extended definition should be established by the parties at a later date (exhibit 62).

4. SULFURIC-ACID ALKYLATION

One of the principal present-day methods of producing aviation gasoline became the subject of active negotiation during the year 1938. A pool formed to cover the process is of special interest for the questions it poses as to the relation between patents and patent pools. The parties attached such value to the process as to fix a high royalty rate for licensees. However, Standard had such a weak patent position that its own executives concluded Standard had no reasonable possibility of prevailing in an interference proceeding. Nevertheless, Standard obtained a position in the pool entitling it to licenses under all the pool patents royalty free and to participation in royalties from licenses to others.

The proceedings in question came to be called sulfuric-acid alkylation. Like polymerization, it is the joining together of light hydrocarbons to make heavier hydrocarbons. In this case the starting material and the products are of different type. In polymerization each of the 2 joining molecules lack the maximum number of hydrogen atoms they are capable of containing; the product of the combination must be hydrogenated to produce an aviation gasoline material. In alkylation 1 of the 2 four-carbon-atom molecules has its maximum of 10 hydrogen atoms and accordingly the resulting eight-carbon-atom molecule has its maximum of 18 hydrogen atoms and no further hydrogenation is necessary.

Formerly it had been thought that the molecules lacking maximum hydrogen, called olefins, were the only ones that could be joined. The new process rested upon ascertainment that the molecules containing their full measure of hydrogen, called paraffins, could be made to combine with olefins if the atoms in the paraffin molecule were arranged in a branched or crossed formation. This formation, giving the material the name "iso" paraffin, would also carry over into the product and give it an "iso" formation, which, for the purposes of aviation gasoline, is the type of product desired. This product it "iso" octane—8 carbon atoms and 18 hydrogen atoms, arranged in a branched or crossed formation.

The part played by sulfuric asid in this reaction is that of a catalyst. The acid does not itself enter into the reaction, but its presence facilitates the reaction whereby these materials are combined to result in this product. "Iso" octane in its perfect state is itself the level of 100 octane from which the octane rating is measured. As produced from refineries by sulfuric-acid alkylation the material rates from 90 to 96 octane and is a high-quality blending agent for raising the octane number of base stock gasoline. The blend, with other additives to improve the quality in other respects, is leaded to 100 octane.

Sulfuric-acid alkylation more than doubles the output of aviation gasoline from a given run of crude oil and has proved to be one of the most valuable and economical means of production of aviation gasoline at the present time.

In July 1938 Standard discovered a sulfuric-acid alkylation process from a British patent obtained that summer by Anglo-Iranian Oil Co., Ltd. Its value for production of aviation gasoline was perceived almost immediately. Standard also readily found that it had no patents at all on the subject, but that Shell had obtained a British patent bearing an international convention date in Holland of several days prior to the Anglo-Iranian patent. Both patents were filed in July 1936. Shell's patent was more specific than Anglo-Iranian's, but on the other hand the claims of Anglo-Iranian's patent were broader. A license under both was obviously more desirable than one under either taken alone.

It was found that Universal Oil Products Co. also had an old patent of 1935 which had some bearing on the process, but did not touch it with any precision.

Digitized by Google

Standard reviewed its files and ascertained that in 1935 its chemist, Mr. Stahly, had actually brought about the patented reaction in experiments at Baton Rouge. The experiments had not been followed up because no satisfactory analysis had been made of the product of the reaction. It was also found that as early as 1931 Dr. Schneider, working for Standard Alcohol Co., had conducted experiments which could be shown to have involved the same reaction. These experiments apparently had not been followed up. These facts have been taken from a letter of September 13, 1938, by Mr. W. E. Currie, patent attorney for Standard, to Frank A. Howard at London, reviewing the patent question in this field. Mr. Currie came to the conclusion that on the basis of Standard's previous experiments it must decide the issue whether to file application for a patent or to contest the existing patents on the ground of prior discovery and public use. I quote Mr. Currie's observations as decidedly of interest in connection with the arrangements eventually worked out. Mr. Currie stated:

"No doubt we did exactly what the patents called for, but no one realized just what was obtained. The advantage of the method was not appreciated until the disclosure of the patents came to our attention. * * * We are seeking an interference after being spurred into activity by our competitors' disclosure. * * * Conditions being as they are, however, the best course, as we see it here, is to file the application" (exhibit 63).

Of the Stahly experiment, in particular, Mr. Currie continued as follows:

"The Stahly experiment is not satisfactory for use as a basis for filing a patent application. At most it shows the conditions of operation described in the Anglo-Iranian and Shell patents. By a great deal of explanation and "hindsight" it might be possible to show that Stahly must have obtained alkylation. Situations such as this are on the ethical margin. With some liberalness of view, I suppose we can justify the filing of a patent application on this work, although it must be admitted that the chance of ultimate success if we get into interference with Shell and Anglo-Iranian, is almost nil."

Mr. Currie's general conclusion was that Standard should apply for a patent and file interference, in the hope of obtaining a patent agreement, regardless that Standard's chances of winning in interference were "very small." His conclusion was expresed as follows:

"If we do file the application and lose in interference with Shell and Anglo-Iranian, we would then, of course, be in a very poor position to set up the alleged public use as a defense. We would have taken the position that it is not a public use by asking our inventor to swear that, to the best of his knowledge and belief, the invention has not been in public use more than two years before he filed his application. While an inconsistency of this sort is probably not fatal, nevertheless it would be very prejudicial to our case.

"This situation involves a question of policy. To be perfectly frank about it, we have very small chance of winning in interference. What we are really doing is provoking one for the purpose of introducing prior art to show that the claims are not patentable, unless our opponents have been willing to make some sort of agreement with us which will result in a satisfactory settlement of the issues. You will recall that the same thing, or a closely analogous situation, occurred in the Ester Salt agreement, in which the Shell Company filed a United States application and went into interference with our case, although we firmly believe that Shell never had any expectation whatever of being able to establish priority. This action by Shell probably was largely instrumental in getting the United States patent situation in the Ester Salt agreement. We believe that where there is any reasonable doubt, it is fair to go in interference on early work which may not fully satisfy the requirements of proof which would enable us ultimately to win the interference."

By October 1938, Standard had discovered that Texas also had a patent position, and furthermore, that an old polymerization patent belonging to Standard Alcohol Co. broadly covered the operation—although in terms of polymerization. The latter patent, however, was due to expire in 1940.

It happened that just at this time, as will be shown more particularly later, Standard's representatives were in conference in London in a series of negotiations of formation of a broad patent and technical pool covering catalytic processes. The general scope of the negotiations included the sulfuric-acid alkylation field by definition. The parties with whom Standard was then negotiating on this subject were I. G., Indiana, and Anglo-Iranian. In these circumstances Standard sought a special agreement with Anglo-Iranian to cover the

Digitized by Google

particular discoveries made by it as to sulfuric-acid alkylation. Mr. Howard, on October 10, 1938, cabled Mr. Russell Anglo-Iranian's reaction as follows:

"Anglo Persian Oil Company, Ltd., considers they are pioneers in alkylation field but absolutely not interested (in) royalties and agreeable in principle exchange alkylation with us on the assumption we have technique or experience of some value to offer" (exhibit 64).

During the course of the negotiations Standard decided that the best policy for gaining a position under the agreement would be to press aggressively its own use and development of the discoveries patented by the other parties. This policy was expressed in Mr. Howard's cable as follows:

"My impression is this whole development will be so involved that we can safely count upon working out satisfactory arrangements if we aggressively push practical developments, thus certainly acquiring valuable technical experience and probably improvement patents (Stop). I therefore favor proceeding at once with Baton Rouge conversion and acquiring all technical data necessary (for) Aruba and Palembang jobs (Stop). It is evident 'none of the companies' active in this field feel they have any effective monopoly in the situation because all seemed to have been endeavoring to trade (Stop). Therefore urge straightforward aggressive policy on technical developments, use in patents with assurances future patent problem can be taken care of reasonably satisfactorily" (exhibit 64).

Standard obtained an agreement from Anglo-Iranian that it would act together with Standard in negotiations and give Standard the benefit of its patent position. For the purposes of this understanding, Mr. Howard cabled from New York to Anglo-Iranian on January 16, 1939, that:

"Up to this time we have no commitments to exchange information or licenses in this field with any other parties but there have been preliminary discussions with Shell and Texas and it seems probable that it will eventually be desirable to make some arrangement at least with Shell" (exhibit 65).

In this connection, there does not appear to be any way of reconciling this representation with Standard's long-standing obligation to I. G. under the four-party agreement of November 9, 1929, Article X providing as follows:

"The parties agreed to work together on the technical development of the hydrocarbon field, to communicate to each other during the life and within the scope of this agreement all technical knowledge and experience, past, present, and future, patented and unpatented, of which the parties are now possessed or shall hereafter be possessed in the sense of having the power to dispose of them, and also to help each other in their efforts to obtain adequate patent protection."

It was finally arranged not only that Anglo-Iranian would permit Standard to come in on an equal basis with it, but that also Anglo-Iranian would entrust to Standard the negotiations with the other parties. This is interesting in view of the fact that in the very beginning Standard sought—as it was characterized in a letter of September 14, 1938, by Mr. Russell to Mr. Howard—"a free ride under Anglo-Iranian alkylation patents world-wide, or even a participation with them in an attempt to exploit the field jointly" (exhibit 66).

Standard finally concluded a contract providing a participation of 30 percent in favor of Shell, 30 percent in favor of Texas, and 40 percent to be divided between Standard and Anglo-Iranian. Standard thereupon, in view of the weaker patent position originally held by it, offered to waive the 50–50 agreement with Anglo-Iranian and to split the 40 percent so that Anglo-Iranian would receive 24 percent of the total and Standard 16 percent. Anglo-Iranian, however, declined the offer. It insisted on bestowing upon Standard the full half of the 40 percent to be divided between Standard and Anglo-Iranian (exhibits 67 and 68).

The agreement executed as of April 12, 1939, conferred upon each member royalty-free licenses for the world under the present and future patents of each of the parties. It provided for exchange among them of their present and future information within the defined field. Each party retained the right to grant licenses under its own patents, but was required to turn into the pool 50 percent of receipts under United States patents, and 100 percent of receipts from foreign patents. The agreement also permitted any party to grant licenses under any and all of the patents of all parties, but upon a form of license prescribed by the agreement incorporating cross-licensing and other terms, and fixing the royalties to be charged.

Digitized by Google

These royalties, fixed at 42 cents per barrel (equivalent to 1 cent per gallon), are high as admitted by Mr. W. E. Currie in a letter of December 7, 1939, to Mr. Merrell E. Clark.

It was pointed out by a letter from the Standard Oil Co. of Ohio to Mr. Russell dated September 8, 1939 (exhibit 69) written in negotiation for a license, that the high royalties fixed for sulfuric acid alkylation were based on the fact that the product was to be used in an expensive fuel. Ohio sought a license to use the process, but to use it only for the purpose of making motor fuel of good quality. Therefore, it asked for a license at a royalty amounting to one-fourth of the royalty fixed by the agreement. Ohio pointed out that there was precedent for such a request "established in the catalytic polymerization field." It appears that Ohio's complaint that the royalty was excessive solely because the process was used in connection with an expensive product was justified. From a letter written by Mr. D. Pyzel of Shell to Mr. E. W. Isom of Sinclair Refining Co., on March 21, 1940, it was stated as follows:

"I am sending you our present standard license form from which you will see that we have decided to charge a rate of 1¢ per gallon for alkylate produced without regard to whether the product will be used for aviation fuel or for other purposes. However, we have already made you an offer for a license on the basis of ½¢ per gallon for alkylate product and an additional ½¢ per gallon if such alkylate is used for aviation fuel" (exhibit 70).

In result, with practically no patent position, but by deliberately forging into the field and acquiring experience after discovery of other patents and by making use of its affiliations, Standard acquired not only free operating rights under but also a participation in the revenues from one of the most valuable modern processes, commanding a high royalty return.

It is interesting in this connection to turn to the list of Standard's applications and patents attached to the sulfuric acid-alkylation agreement. No United States patents belonging to Standard are mentioned, but only applications. The only one filed earlier than November 1938, at which date the negotiations were in full swing, is one that is not referred to in Mr. Currie's memorandum. We notice it only in a letter from Shell to Mr. Currie dated November 14, 1939, in which Shell objects to the inclusion of this patent on the ground that it did not properly come under the alkylation agreement. Standard apparently insisted on mentioning this application in the list attached to the agreement, presumabily in order to make some show of an earlier date. In the same letter Shell also objected to Standard's inclusion of the only issued patent that Standard had claimed in the field and this patent was not listed under the agreement.

On May 5, 1939, Mr. Currie wrote to Mr. P. J. Whelan, of Humble Oil & Refining Co., who had drafted the application which Standard had insisted on listing under the agreement. Mr. Currie informed Mr. Whelan of the successful outcome of the alkylation negotiations and of the help given Standard in these negotiations by the terms of the application as drafted by Mr. Whelan in 1935. I quote Mr. Currie's expressions for their value in characterization of the patent pool represented by the sulfuric acid agreement as follows:

"We regard this as a favorable outcome to the negotiations. As you, of course, know, we made a great deal of capital of the disclosure in our United States patent application Serial No. 56,914 of the conditions which are necessary to effect alkylation. I do not know how much weight this carried with the other parties, but I am sure that it had considerable beneficial effect.

"We do not quite give you credit for foreseeing all the effects of this statement. However, whether it was included with conscious effort to provide for possible developments, or whether it was included merely because of the intuition of the skilled patent solicitor, we congratulate you on putting it in" (exhibit 71).

One other party was taken into the alkylation agreement. It developed that Universal had a patent claim. In fact, a patent taken out by Universal in 1935 was sustained by the Patent Office as covering the field. Mr. Currie in reporting to Anglo-Iranian in a letter of October 21, 1940, the necessity of bringing in Universal, stated the point as follows:

"It would have been possible for Universal to defer final decision by making the various appeals allowed by law for three years or more. In the absence of any agreement, this situation would have disastrously affected the licensing position of the group. It was for this reason that Universal was desired as a party to the agreement along with the oil company parties" (exhibit 72).

It was not necessary, it may be observed, at least as to Standard, Shell, and Texas, to take in Universal for their own operations. By an earlier 1931 Uni-

Digitized by Google

versal settlement, those companies obtained immunities under all of Universal's present and future patent rights, which were also to be available to such wholly owned subsidiaries of those companies as should grant back cross-licenses to Universal on their pyrolytic cracking rights. However, inclusion of Universal enabled the pool to grant licenses to outsiders on Universal's patents (exhibit 73).

As noted in the above-mentioned letter to Anglo-Iranian of October 21, 1940, Universal was awarded an 18-percent participation in licensing receipts. An exception was made, however, as to joinder of Universal as regards Germany and Japan. Universal had granted exclusive licenses under all its alkylation patents for Japan.

In a letter of December 18, 1940, Mr. Howard reported to the Standard executive committee that Standard had arranged to discharge all its obligations assumed in the original C. R. A. interchanges of experiences begun in 1938 with Indiana, Kellogg, Anglo-Iranian, and I. G. To this purpose, he presented for approval an agreement with Indiana whereby Standard would waive all of its share of royalties under the sulfuric acid alkylation pool as against Indiana and whereby Standard would receive a free license under all of Indiana's patents in the field. As to Anglo-Iranian, that company was a partner in the agreement. Kellogg, it was stated, "had been taken care of by granting them a licensing agency." As to I. G. it was said:

"The position of the I. G. was to have been taken care of by special arrangements for Germany which are necessarily in abeyance because of the war" (exhibit 74).

As to exchange of information with I. G., we may note that this was discontinued by action taken by a meeting of the representatives of Shell, Texas, Anglo-Iranian, and Standard held on November 1, 1939, as recorded in a memorandum of that meeting reciting as follows:

"It was unanimously agreed that under present circumstances no further technical information or experience concerning alkylation would be passed on to I. G." (exhibit 75).

All of these agreements—Polyco, dealing with polymerization of gases to produce gasoline; Julk, dealing with dewaxing and solvent removing treatment of lubricating oil; and the sulfuric acid alkylation agreement, dealing with the production of aviation gasoline blending agent—were affected by duties enjoined upon Standard by the recent consent decree. Since the decree dissolved the ties between Standard and I. G., these can no longer be used to create through Standard a relationship between I. G. and the patent pools. Standard will no longer consolidate the combined patent and technical assets and resources of itself and I. G. Nor will Standard be able to use an I. G. partnership to acquire special privileges from the pools or to exercise undue power therein. I. G. will not have the right in the future to call upon Standard to obtain for I. G. patent or technical benefits.

As to aspects of these pools not tied in with the Standard-I. G. partnership, the decree contains certain further requirements imposed upon Standard. As to these requirements, however, it is provided in the decree that Standard shall not be deemed in contempt for failure to fulfill them to the extent it is prevented from doing so by refusal of the other parties to the contracts in question to agree to amendments. Of course, the Department is not precluded by the decree from taking any action that should be found necessary and appropriate as against the pooling agreements themselves on their own merits and wholly apart from the restraints created by the Standard-I. G. tie. Doubtless any question as to any further action in regard to patent pools of this character will derive guidance from the results of this committee hearing.

The decree requires Standard, however, to undertake and carry on diligently negotiations with the various pool members to bring about amendments to accomplish the following results specified in the decree. These are: First, to assure that licenses under all of the pool patents as well as the "know how" will be available for the period of the war to all persons. Second, to make licenses and "know how" available after the war to any person without any restrictions whatsoever on the use of the patent or as to products to be produced, and without any other limitations whatsoever, but with the right to charge reasonable royalties. Third, to refrain after the war from bringing any further patents into the pools without the assent of the Attorney General.

C. R. A.

Among the oil patent pools promoted by Standard in exploitation of its management of the combined patent assets of itself and I. G. Farben Industrie, the pool covering far the broadest field of operations was that promoted under the term

Digitized by Google

"C. R. A." The initials presumably signify Catalytic Refining Association. The proposed pool covered the broad field of catalytic refining, including catalytic cracking, catalytic vis-breaking, and catalytic reforming.

The original cracking processes carried out by application of heat, called thermal or pyrolytic cracking, had been found to break down the heavier hydrocarbons into lighter hydrocarbons such as gasoline. The discovery had practically doubled the output of gasoline from crude oil. During the latter 1930's a technique began to evolve for the use of various catalysts in this cracking operation, with resulting increase in yield and in quality of product or improvement in conditions of treatment. There began to evolve, also, the technique of reforming with the use of catalysts. By reforming, a given distillate of crude oil could be improved in its characteristics by rearranging the formation of the molecules comprising the distillate.

The use of hydrogen in these operations under certain circumstances was also found to be valuable. In that connection Standard from the beginning insisted that the hydrogenation agreements had a possible claim upon the use of hydrogen, even though addition of hydrogen into the final product was not involved, and though hydrogen was used only to facilitate the reaction without being itself consumed as it is in hydrogenation. The process ultimately developed involving the use of hydrogen, which was given the name "hydroforming," is capable of producing high-octane gasoline, toluol for explosives, and other valuable products.

Several forms of catalytic cracking have been developed. Catalytic cracking is also capable of producing high-octane gasoline as well as the C–4 raw material for butadiene, and other valuable products.

Early in the C. R. A. negotiations the importance of this field of operations was described by Mr. Howard in a letter of October 19, 1938, to the Shell Co. as follows:

"The developments here in question appear to be the most important technical developments which th oil industry will have to face for the next few years, and it seems reasonable to assume that catalytic cracking, catalytic viscosity breaking, and catalytic refining, all conducted sometimes without the use of dydrogen and sometimes with the use of hydrogen, will be primary processes of the oil industry and in universal use.

"These processes appear to give exactly what the oil industry needs for the next decade to preserve its balance, that is, higher octane gasolines and larger yields of distillate fuels with lower yields of residual fuels. These results can be obtained through the use of the catalytic technique with investment and operating costs almost identical with those of the corresponding thermal operations" (exhibit 119).

A final C. R. A. pooling agreement was never reached. Negotiations began during the year 1937. By 1938 formal drafts of agreement had been evolved. Negotiations continued indefinitely thereafter. Memoranda of agreement upon C. R. A. were drafted as of October 12, 1938 (exhibit 120), October 13, 1938 (exhibit 121), August 15, 1939 (exhibit 122), February 3, 1940 (exhibit 123), April 17, 1940 (exhibit 124), May 11, 1940 (exhibit 125), July 19, 1940 (exhibit 126). The draft of July 9, 1940, is the latest to which I have had access. Though a final agreement was never formally adopted and executed, there were numerous negotiations with potential licensees. One license was actually granted to Pan American, a subsidiary of Indiana, by instruments executed by the separate parties conformably with the then existing C. R. A. memorandum. Other licenses were similarly granted. I file in one batch as exhibit 127 documents showing many of the acts done and commitments assumed pursuant to C. R. A.

From the beginning the C. R. A. memoranda have by definition covered operations far beyond the scope of any existing patents, or, indeed, of any existing process. The memoranda have been formulated as licensing agreements which would cover not only technique already evolved and falling within the definitions, but also processes that might be evolved in the future. The negotiations did not arise out of patent conflicts. They began before the processes had been discovered. It is true, however, that the desire to fix by contract the rights in future patents and technique was not indulged all by itself and without any occasion for it. An independent process outstripping existing methods and producing a superior quality high-octane gasoline had been volved. The Houdry process, developed by a Frenchman of that same, had been acquired by Sun and Socony. Sun, with the courage of its convictions, had forthwith invested over $10,000,000 in a plant, and it was successful.

Digitized by Google

A principal purpose of C. R. A. cooperation was to develop, by joint research, a process to meet the Houdry challenge. The C. R. A. negotiations sought to settle in advance the rights of the parties in patents and technique that might evolve from the common research effort, and to provide for licensing to others. The field of research cooperation spread to many operations. Voluminous reports of technical data and laboratory information were exchanged. The progress thus made was undoubtedly of great practical importance. But regardless of whether the C. R. A. memoranda were intended merely to serve the purposes of the joint research and to provide a means of licensing such discoveries as should be made, or whether they were intended to assure control of operations in the field, the terms of the memoranda as formulated were of a character to freeze for a long time to come and to fix by contract the benefits and burdens attaching to patent rights and technical information falling within the broad process definitions. The memoranda as formulated gave Standard, and through it I. G., a fixed royalty advantage, a right to royalties by definition from all other members of the group, and the right to utilize developments by all parties without payment of royalties. The members were the leaders in the industry, and the memoranda in terms were drawn so as to crystalize their position.

Furthermore, the record shows that Standard promoted C. R. A. with the purpose of thus controlling future patents by force of contract. It also shows that Standard utilized, to the utmost, advantages accruing to it from existing contractual relations and affiliations in order to bring about a C. R. A. agreement having this effect. Standard used to the utmost its advantageous position under the hydrogenation agreements to bring about acceptance by the members of Hydro Patents Co. of a general agreement upon catalytic refining, with and without the use of hydrogen. Standard sought to utilize the C. R. A. negotiations as a means for a general settlement with Shell which would restrain competitive licensing by Standard and Shell. Standard exercised to the utmost the power of its basic partnership with I. G., while consistently keeping concealed from the C. R. A. partners the extent to which Standard already controlled all of I. G.'s patents in the field, and for this purpose trading to its own advantage upon the impression that the terms must be made satisfactory to I. G. in order to obtain its consent. On the other hand, after the outbreak of war, Standard gave the industry the impression that Standard had taken over all interests of I. G. in the C. R. A. patents, whereas I. G.'s interest remained substantially unchanged.

The effect of the C. R. A. memoranda as drafted.—The first C. R. A. partners pursuant to the draft of October 12, 1938 (exhibit 120, supra), were Standard, I. G., Indiana, and Kellogg. Anglo-Iranian was to join in the exchange of information and patent rights and to have favored royalty rates without participation in royalties. Because of a patent reciprocity agreement, Indiana was to be permitted to bring in Texas on an equal footing with it. Standard was to be permitted to bring in Shell on an equal footing with it.

The basis of distribution of royalties was placed in terms upon the size of the respective companies in relation to the world's oil industry, and not upon their patent assets or patent contributions. I. G.'s size was arbitrarily presumed to be the same as Standard's. The general nature of the royalty divisions remained the same in the later memoranda. By the time of the draft of August 15, 1939 (exhibit 122, supra), Shell, Texas, and Universal had come in.

The C. R. A. memoranda embodied the restrictions preventing the manufacture of chemical products which were embodied in the four-party agreement between Standard and I. G. They contained also additional restrictions narrowing the use of many of the refining processes to the production of naphthas and specified fuels. The use of the pooled patents for the manufacture of chemical products was to be permitted under licenses from the pool only to the extent that such products constituted byproducts normal in the operations of the oil industry. Thus toluol and butadiene could be produced only as byproducts.

Under the terms of the memorandum of July 9, 1940 (exhibit 126, supra), each of the oil company members licenses each other under its present and future processes as defined and divulges to each other all technical information in the field. The parties grant licensing rights to Universal and to Kellogg, and under certain conditions to S. I. G. Members' rights may not be licensed without a cross-license by the licensee under all its present and future processes within the field.

Digitized by Google

The draft of July 9, 1940, in terms permits each member to issue separate licenses under its own patents and retain the royalties, but he is prohibited from transmitting to his licensee not only the technical information acquired from other members of the group but even his own information, except in cases where it is necessary to protect such member's operating interests. The latter contingency is doubtless concerned with possible patent conflicts. Members are required to use special efforts to prevent technical information acquired from the group from being used in the chemical field, or even in the oil field for specified processes, either in their own operations or the operations of others. They are required to prevent any disclosures to outsiders.

Members are required to pay specified royalties to S. I. G. by definition, regardless whether their operations do or do not need a license under any patent of the pool.

As in the case of the hydrogenation system, members and licensees are required to grant licensing rights under their foreign patents to a special company to be owned jointly by Standard and Shell. Universal was required, in return for a specified participation in royalties, to surrender to this special company all of its foreign patents in all fields, within and without the C. R. A. field.

The July 9, 1940, C. R. A. memorandum was thus in terms a general patent settlement, covering the complete and world-wide plan, tying its members and licensees tightly into the system and banding them together in defense of the system.

From the beginning Standard sought to promote an agreement which would control the catalytic refining field.—Standard's purposes and the complications involved appear at an early stage in the following cable of January 27, 1937, from Howard & Pyzel (of Standard and Shell, respectively) to Brandon Hague:

"We propose to endeavor to work out the following program: *Firstly*, all Universal security holders to grant to Universal nonexclusive right to grant licenses under their patent rights for catalytic cracking and to share expense of enlarged research program on this subject by Universal; *secondly*, I. H. P. and Hydro Patents grant Universal nonexclusive right to license in U. S. and exclusive right outside U. S. their patents on catalytic cracking and agree to provide catalysts on suitable basis; *thirdly*, Universal grants Hydro Patents nonexclusive and I. H. P. exclusive right to license all Universal patents on hydrogenation; *fourthly*, I. H. P. and Hydro Patents grant Universal right to license hydrogenation of polymer at 15¢ per barrel either inside or outside U. S. Stop Purpose is to build up strong patent position on catalytic cracking, including catalytic dehydrogenation in Universal and at same time make permanent clear division of field between cracking and hydrogenation Stop Please discuss also with Interhydro and cable your opinion" (exhibit 128).

The reply cabled on January 22, 1937, stated:

"Yours 19th AD firstly AD secondly since existing hydrogenation contracts of I. H. P. and Hydropatents don't extend to catalytic cracking and at least I. H. P. have so far not otherwise acquired rights this field. Please inform what you have in mind. Stop" (exhibit 129).

On January 27, 1937, Messrs. Howard and Pyzel replied to this cable as follows:

"We realize existing I. H. P. and H. P. contracts do not extend to catalytic cracking, but as some catalysts and general technique very similar to hydrogenation consider it desirable to extend agreements where necessary" (exhibit 130).

Standard endeavored to clear the way toward a general agreement by disposing of the field of polymerization, covering processes already developed, which were pooled under the agreements that we have mentioned. The situation was stated by letter of June 21, 1937, from Mr. Pyzel to Mr. Jacobson, both of Shell, as follows:

"As said before, once we have an agreement for cooperation in these special fields of catalytic polymerization and hydrogenation of polymers, similar agreements in a wider field will be easier to make. I am, however, of the opinion that further extension of proposals for cooperation should not be made before this comparatively simple agreement is made and has proven to be successful" exhibit 131).

On January 7, 1938, Mr. Howard wrote to Messrs. Farish and Teagle a characterization of the plans in refeernce to the new developments as follows:

"Mr. Russell and I have a plan under which we believe we can institute full cooperation between the larger companies interested in Universal in the field of catalytic cracking—and still leave the door open for us to go along with Houdry if they make us an acceptable proposition" (exhibit 132).

We may observe that at this time Standard appraised I. G. and Kellogg as counting for little in the oil industry without the alliance with the Standard. In making this appraisal for the purpose of viewing the future bargaining course Standard should take, Standard envisioned the possibility of competition resulting but resulting in such a manner that Standard would derive advantages from both competing sides. We see this position asserted in a letter by Mr. Howard to W. R. Carlisle of Standard's London office dated May 17, 1938, in the following:

"This naturally raises the question of whether we are making a mistake in going along with the plans for an I. G./Kellogg/Jersey combination. I do not think so. I believe that we should attempt to create and maintain always real and sound competition in all basic developments in the industry. The Universal/Houdry combinations would be strong enough to get along without our direct help. The I. G./Kellogg combination cannot become a real factor in the industry, I believe, unless we go along with it. The outcome of this situation may be in either of two directions: If there is no serious patent conflict between the two groups, they may go along indefinitely in direct competition with one another; if there is a serious patent conflict, they will have to find some 'live and let live' basis of settlement similar to the settlement worked out between Universal and Gasoline Products."

That Standard would not be confined to one competing group was stated as follows in the next paragraph:

"As regards Jersey's own position, we automatically have a license under all of Universal's developments; and through our I. G./Kellogg deal we will hope to emerge with a free license under all of these developments; and in addition, a participation (either directly or through I. G., or both) in the licensing revenue. I would hope that the possible deal between Houdry and Universal would take such form that through it we might also secure a complete license under the Houdry patents.

In spite of the possibilities of ultimate understanding with Houdry this letter pointed out, however, that:

"We have definitely abandoned our negotiations with the Houdry group and are therefore in a position to close a deal with Kellogg at once if we desire to do so" (exhibit 133).

The office of the C. R. A. agreements under negotiation, as that of agreements to control the patents of the future is emphasized in a letter of June 10, 1938, by Frank Howard to Dr. Butefisch of I. G., outlining the policy to be pursued by S. I. G. in exploitation of the pooled Standard-I. G. patents as follows:

"We feel very strongly that it is to the advantage of our group to organize the first general plan of handling this catalytic development and licensing situation. If we can work the matter out along the lines indicated in these memoranda, we may find it to our advantage to offer the same general scheme, with any necessary adjustments of the figures, to some other strong and aggressive oil companies who may be expected to contribute something worth while to the catalytic cracking development within the very near future. The pattern we are now working on would appear to be one which would permit us to undertake other negotiations without any further complications, merely fitting each new company in by adjustment of the figures as to amount of royalty, or period over which royalty should be paid."

This letter shows very plainly that what Standard sought at the time was an agreement, not existing patents, and that is again emphasized in this description by Mr. Howard of Standard's patent position:

"The other oil companies mentioned have, so far as we know, no real patent or technical assets of any description up to this moment, although doubtless they have some patent applications" (exhibit 134).

The nature of the agreement and its scope as a cover-all is further reflected by the fact that the parties themselves were under great confusion as to which of their patents fell within the negotiations. Bruce K. Brown, general manager of research and development of Standard Oil Co. of Indiana, wrote to Mr. Howard on November 18, 1938:

"* * * I am planning to bring a list of our patents and applications in this field to New York with me; the list will also include a one- or two-sentence description of the subject matter of each case.

"In further considering this matter, Bill Plummer and I have found it difficult to decide just what to include and what to exclude from the figure, although I think that the figure wired you is on the high side.

* * * * * * *

Digitized by Google

"* * * We have two other questions which are hard to answer. First, how many of our hydrogenation applications would cover intermediate zone processes, and, second, how many of our patents for applications directed primarily at thermal cracking would be infringed by catalytic cracking.

"We have not made any attempt to solve these problems and will not do so until after I have talked to you more on this subject" (exhibit 135).

The intended scope of C. R. A. was stated to H. P. members, at the time of the proposal to join H. P. to C. R. A. directly, in Mr. Howard's letter to them on December 6, 1938, as follows:

"* * * A solution was proposed along the following lines. S. I. G. would acquire the rights of all the interested parties in the entire field of catalytic refining, with and without hydrogen" (exhibit 136).

In a memorandum by Mr. F. R. Loofbourow of the Standard Oil Development Co. of August 21, 1939, the scope of the C. R. A. negotiations was thus stated:

"Since the technical knowledge of the parties relating to catalytic cracking would necessarily be applicable to a very large extent in processes of catalytic reforming and catalytic gas reversion and alkylation, it was necessary to bring these processes under the same arrangement; and this was done by making the arrangement cover the entire field of catalytic refining which includes all of the above processes" (exhibit 137).

Standard's Use of the Hydrogenation System To Promote a C. R. A. Agreement.—The relationship of the C. R. A. proposals to the hydrogenation system are thus explained in an unsigned Standard memorandum of October 20, 1938:

"The stock of Hydro Patents Company was purchased by eighteen potential licensees of the process—that is, practically all U. S. refiners who had, at that time, a charging capacity in excess of 20,000 Bbls./Day. In addition to purchasing stock in Hydro Patents (the allotment being proportionate to charging capacity) each of the companies accepted a license from Hydro Patents, royalties being on a fixed scale but payable only on use of the process. The Jersey operating companies accepted licenses from Hydro Patents, the same as all other large oil companies. For business outside of the United States and Canada, Jersey and I. G. organized a somewhat similar corporation called "International Hydrogenation Patents Company." Shell later bought an interest in this foreign development.

"As the result of this arrangement practically all U. S. refiners are obligated to pay royalties to Hydro Patents (for the account of S. I. G.) if such refiners *use* the hydrogenation process, *as the same is defined*, in their license contracts with Hydro Patents. *Herein lies a point of uncertainty which makes it necessary to include Intermediate Zone Processes* in the present contract."

* * * * * * *

"In years subsequent to the signing of these contracts it has been discovered that various processes for catalytically refining oil are improved to a greater or less extent by the *mere presence* of hydrogen, although the analysis of the products leaving the reaction zone does not indicate that any of the hydrogen present was actually absorbed by (reacted with) the material undergoing treatment. For example some catalytic processes for reforming naphtha involve fundamental chemical reactions of a nature which *give off* instead of absorbing hydrogen *and yet* the process is greatly improved by *adding* extraneous hydrogen to the stock undergoing treatment.

"Note that the process above described is fundamentally a catalytic cracking process, yet the same catalyst which produces the beneficial result is able—if hydrogen is present—to produce a still more beneficial result. I. G.'s technique of using hydrogen and catalysts together to effect a useful result on some third material (commonly thought of as "hydrogenation") has merged indissolubly with another technique—namely that of catalytically cracking petroleum. Note also that a process of this type does *not* come within the scope of Hydro Patents license contracts because it does not cause " a definitely determinable hydrogenation" of the naphtha" (exhibit 138).

The categorical statement at this early date, October 10, 1938, that processes involving addition of hydrogen without net consumption of hydrogen did not come within the Hydro Patents licenses is worthy of note. Standard, nevertheless, adopted a policy of playing up to Hydro Patents members the possibility that perhaps their licenses did tie into these intermediate zone processes.

At an early stage, a proposal was evolved that all parties place these intermediate zone processes in S. I. G. and that S. I. G. arbitrate to what extent royalties therefrom were hydrogenation royalties—all, of which, of course, were

Digitized by Google

payable to S. I. G. The proposal included a split of hydrogenation royalties that would lend attraction to the new set-up. The proposal was thus explained by Mr. Howard in a cable from Berlin of August 18, 1938, to Mr. Russell as follows:

"Retel sixteenth have further tentatively agreed with I. G. as follows: Firstly intermediate field defined as catalytic heat treatment process with added hydrogen in which there is no net consumption of hydrogen. Secondly all parties agree to assign rights to Standard-I. G. Stop. Standard-I. G. will decide whether such processes under hydrogenation field. Thirdly, if process within hydrogenation field one half royalties retained by Standard-I. G. other one half go to catalytic cracking unit and are apportioned as other revenues from catalytic cracking license. Fourthly if process not within hydrogenation field shall be licensed exclusively by catalytic unit under terms no more favorable than provided in catalytic cracking agreement and no more unfavorable than in existing hydro patents agreements. Stop. (exhibit 139).

On the same day Mr. Howard wrote Mr. Russell from Franzenbad, Czechoslovakia, describing the use to be made of the intermediate zone as a means of bringing pressure upon H. P. members to bring them into a general agreement on catalytic refining. The letter so states in terms as follows:

"I think we have made a great step forward in the proposed settlement of this intermediate processes question. I believe the mechanism of settlement under which the royalties are, in effect, pooled between the catalytic unit and Standard-I. G. in this intermediate zone will give us so much flexibility in the handling of processes in this field that we will be able to meet almost any situation. It will tend to tie together the Hydro Patents group and the catalytic group, and we might eventually hope to get most of the members of the Hydro Patents group into the catalytic group. Under these conditions their sympathies would naturally be in the direction of deciding the debatable cases in favor of the catalytic group where the royalty rates were lower.

"I think we also now have a very good situation to put up to the Shell people. We can agree with them that, if they will come into the catalytic group, we will put I. H. P. into the same position as Standard-I. G., that is, pool its revenues with the catalytic unit group for foreign licensing in the intermediate zone. Of course, everything depends on the real extent of the patent protection which I. G. already has and which the group can acquire in this intermediate zone. If we can show even a fairly good position there, I believe we now have provided ourselves with a lever which will consolidate our position in the catalytic field itself, in which the patent protection is apt to be less satisfactory.

"Like most of our major problems, we were rather slow to see this one, but I believe we now grasp it rather fully, and we have at least made a start on a final solution in which we utilize to the very best advantage our hydrogenation position in connection with the newly developing catalytic field" (exhibit 140).

The alternatives thus facing the H. P. members were summarized in the last-mentioned memorandum of October 10, 1938, as follows:

"Finally, it must be remembered that the patents covering hydrogenation generally which are owned by S. I. G. contain claims drafted in the usual manner without any regard for the artificial definitions in later-drawn contracts and that some of these claims may be infringed equally well by the operation of catalytic processes in which hydrogen is present but not consumed.

"Let us assume that a refiner (licensed by Hydro Patents) has independently developed a catalytic reforming process in which hydrogen is introduced but not consumed. If S. I. G. owns patents which are infringed by this process, the refiner has only three alternatives: (1) To seek to have the process regarded as coming under his license and hence to pay royalties; (2) assuming that the process is *outside* the contract, to negotiate a special license for it from Hydro Patents—and hence to pay royalties; (3) to 'fight the patents'—but he cannot do this so well if the court feels that the process does in fact fall under his license" (exhibit 138, supra).

Thus the hydrogenation patents would offer a threat, either through the hydrogenation licenses or outside them, and in either case enhanced by the existence of the agreement, and would exert pressure upon members to come to agreement with the C. R. A. pool.

From this stage the record shows that Mr. Howard sought to swing the hydrogenation group as a body either to tie the intermediate zone definitely into the hydrogenation plan and subject to all the group agreements or to obtain group action by the Hydro Patents members definitely tying the intermediate zone into C. R. A.

Digitized by Google

On December 6, 1938, Frank Howard sent to all H. P. stockholders an announcement of negotiations on the new processes. The letter raised a general question as to the relationship between hydrogenation and catalytic refining with hydrogen, and outlined the proposal to tie together licensing in the intermediate zone and outside, and to have S. I. G. arbitrate the rights of H. P. He approached the possibilities as follows:

"A solution was proposed along the following lines: S. I. G. would acquire the rights of all of the interested parties in the entire field of catalytic refining, with and without hydrogen. It would hold these rights fully subject to its agreement with Hydro Patents Co., so that to the extent any of the rights might subsequently be held to come within the scope of the Hydro Patents agreements, the hydro agreements could attach themselves and become automatically effective. This solution has been accepted by all of the interested parties" (exhibit 141, supra).

On January 11, 1939, Mr. Howard wrote to H. P. stockholders again posing the catalytic refining question generally. I quote therefrom:

"Standard-I. G. Company advises that the following companies have agreed to cooperate technically in the development of the catalytic processes referred to in the letter in question: I. G. Farbenindustrie, A. G., Anglo-Iranian Oil Co. Ltd., Standard Oil Co. (New Jersey), Standard Oil Co. (Indiana), The M. W. Kellogg Co.

"Standard-I. G. Company will have the right to license the inventions of these companies in the field of catalytic refining, which includes catalytic cracking, catalytic viscosity breaking, catalytic reforming, and certain processes auxiliary to the above. The M. W. Kellogg Company is acting as the technical center to coordinate the research work of these companies, especially in its practical application to the construction of plants.

"The catalytic refining processes in question may be carried on either with or without added hydrogen, depending upon the results sought, and the nature of the catalyst employed. Where hydrogen is added, *there arises the question* of whether the process comes within the scope of the hydrogenation agreements of the Hydro Patents Company. To clarify this issue the parties mentioned have drawn a line between cases in which the hydrogen is consumed and cases in which there is no net consumption of hydrogen although a beneficial effect is obtained from the presence of the added hydrogen. The latter class of processes has been identified as 'Intermediate Zone Processes' indicating that they occupy a status intermediate between the conventional hydrogenation processes in which hydrogen is added and consumed, and the catalytic processes in which no hydrogen is added.

"*In recognition of its legal and moral obligation* to Hydro Patents Company, Standard-I. G. has stated that it proposes to offer to Hydro Patents an agreement under which both parties interpret the existing hydrogenation contracts *as covering* the intermediate zone processes; and at the same time, make certain changes in the provisions of the hydrogenation agreements themselves in their application to the licensing of the 'Intermediate Zone Processes.' Presumably, the offer of Standard-I. G. to Hydro Patents would be conditioned upon its acceptance, not only by the Hydro Patents Company as such, but also by some stated proportion of the Stockholder licensees of Hydro Patents. No practical progress can be made in connection with the foregoing question until concrete proposals are submitted by Standard-I. G. and these proposals in turn should be based upon adequate information concerning one or more 'Intermediate Zone Processes' which the stockholders licensees of Hydro Patents Company could examine and evaluate." [Italics supplied.] (Exhibit 142.)

Thus at this date Mr. Howard proposed that the intermediate zone be considered as included in hydrogenation.

Practically the whole of the annual meeting of stockholders of H. P. held on February 7, 1939, was devoted to discussion of the intermediate zone, and whether it should fall to H. P. or C. R. A. At this time no definite report or proposal to H. P. had not yet been made by the C. R. A. group. Mr. Howard presented the issue as follows:

"In brief, our plans are that we propose to present to this group as soon as we have the data, a statement of the technical and economic status, and so far as we know of it, of the patent position with respect to the first intermediate zone process as referred to in these documents which sticks its head above the horizon as a practical process which has some commercial importance. Until that condition arises, you gentlemen have nothing on which you could make a

Digitized by Google

decision as to your policies, I believe, and also we have nothing that we can offer directly in the way of suggestions. All that can be done at this time is to lay the background before you, because against that background you will have to reach your decision, both as director (those of you who are directors of Hydro Patents—you will have to decide what Hydro Patents, as a company, will have to do with respect to these processes) and in your individual capacities, as stockholder licensees, you will each have your own problem as to what position you wish to take" (exhibit 143).

Several members took the position that they did not believe the hydrogenation agreements applied where hydrogen was not consumed and did not wish to see the agreements enlarged. Shell's position was largely similar.

The direct question was asked: What did the hydrogenation definition cover? Did it cover use of hydrogen without consumption of hydrogen, or was it a question unresolved as yet?

Mr. Howard answered the question from both sides:

"It is a question that is perhaps only possible to answer with respect to a particular process which has been carefully analyzed. I think that, as a generality, we would all say that there might be processes in which hydrogen is added to the reaction zone and which it would be very difficult for any fair-minded person to call hydrogenation processes.

"On the other hand, it has seemed to us that *there might be processes which a fair-minded person would say were covered by the definition of hydrogenation and in which there was no net consumption of hydrogen*, and in view of that situation, all that we could say was that it seemed an open question and that open question, so far as we could see, could only be finally answered with respect to a particular process when that process was presented." [Italics supplied.] (Id.)

We shall see that by 1941 Mr. Howard found the latter interpretation practically inadmissable, though still one on which he did not let himself appear squarely to override a dissenting voice. At the 1939 meeting the emphasis was that the question was distinctly an open one.

Mr. Howard moved on to assert that the question was one requiring a new offer by I. G. and acceptance by H. P.

"Perhaps we could make a little progress if I told you that in discussing this matter with the I. G. it seemed that the procedure would have to be about as follows: *There are objections on the part of I. G. also to any widening of this definition* on the rights of the Hydro Patents Company and one of the principal objections is that under the existing agreements the Hydro Patent stockholders who constitute pretty nearly the American oil industry *won't pay any royalty at all* after 1947 and 1947 begins to look as if it was not so very far away, so that I. G. aren't at all happy about that provision in the arrangement, and to get their adherence to any change in this plan, it probably would be necessary to make some thorough-going changes in the whole system. [Italics supplied.] (Id.)

I call attention to this statement that royalties cease, and mention its reiteration on page 5 by Mr. Howard as follows:

"That is right, the rights continue and the royalties cease. No new rights go in" (id.).

At the stockholders' meeting on January 7, 1941, Mr. Howard was plainly anxious to apply more pressure on H. P. members to release all claim to the use of hydrogenation patents in the intermediate zone. He then for the first time brought up the proposition that although I. G. and S. I. G. had no right after 1947 to claim royalties from H. P. or its members, nevertheless H. P. itself could charge royalties on the licenses from it to its members. Since Standard held 40 percent of the stock of H. P. and other C. R. A. members held sufficient additional stock to give control of H. P., it looks as if Standard intended that H. P. members should never be released from royalties after 1947 in any event, or at least should not be able to count on being released. The picture on this subject is certainly a confused one.

The most arresting point to this statement of Mr. Howard's, however, is its representation that the consent of I. G. was necessary to change the hydrogenation agreement. Mr. Howard's words were "any widening of this definition." Standard had entire control of all of I. G.'s oil industry patents with the exception only that as to hydrogenation I. G. must receive 2 cents per barrel (as compared with 5 cents on feed plus 5 cents on product then charged to H. P. members). As to the other oil patents, it was provided that there be a

Digitized by Google

fair royalty and that I. G. be paid 20 percent of the royalty received. It is true that oil patents outside of hydrogenation, acquired by I. G. after 1941, were to revert to I. G. after 1947, but subject to granted licenses. Standard was negotiating with I. G. to extend the joinder of Standard and I. G. patents under C. R. A. beyond that period. But none of that was explained to the Hydro Patents members. It was not explained that Standard in fact had the power to grant licenses to members under any and all of I. G.'s oil patents which should issue before 1948, and that the licenses would be good for the life of the patents. Standard was thus not only using its agreements with I. G. for their power to advance Standard's interest, but was at the same time hiding those agreements and in effect misrepresenting its own interests in the subject submitted to H. P., of which Mr. Howard was president and director.

Mr. Howard then stated the process question in general terms, leaving the meaning of the definitions up in the air. We may note the statement by Dr. Delbridge, of Atlantic, agreeing with the position Mr. Howard had stated:

"We believe it is quite possible to have hydrogenation without any apparent consumption of hydrogen" (id.).

Representatives of other companies expressed uncertainty. Mr. Howard's final opinion of the status of intermediate zone was expressed in these terms:

"I think it is so clearly a debatable question that in the final analysis every company represented here, without criticism at all, can be expected to answer the question in the direction of where its own self-interest lies, and I don't think there is any escape from that conclusion. I think it is just one of those questions which is bound to be answered that way, so really what you gentlemen have to consider, I think, is not so much—at least this is my own conclusion—I think you have to consider not so much these detailed questions of chemistry and law but where does your interest lie?" (id.).

Again, we shall see that in 1941 Mr. Howard lectured against any such position. Even on the question of self-interest Mr. Howard appeared to be playing both sides as follows:

"Just to turn the clock back a little, of course, when the Hydro Patents Company was organized we all had the idea that through this instrumentality we could accomplish something that would be in the interest of all the companies who joined it. The Hydro Patents Company's practical importance has been almost nil in the oil industry because of the nonuse of the hydrogenation process in the United States under the conditions of our industry.

"It now looks, this is only a forecast and not at all a reliable one, but it now looks as though at least the larger part of the technique and a large part of the patent rights which were in the field of the Hydro Patents Company we all considered at the outset may apply to this so-called intermediate zone in which there is use of hydrogen, addition of the hydrogen, but no net consumption of the hydrogen. We have developed the situation so far in our discussion that we see that it is quite possible I think to take either road we wish. We can either say 'No; it is no part of the cooperative effort. We are through that and we don't wish to expand in any way the field of the Hydro Patents Company,' or we could take the other road and say, 'Well, we have a vehicle through which perhaps 80 percent to 90 percent of the American oil industry can cooperate in the building up of contacts and the cross-licensing of patents in a field of considerable interest to us.' If the latter really seemed worth while, I can't answer the question, but if that latter seemed worth while, if the cooperative effort to do anything in this field seemed worth while, the Hydro Patents Company would be the logical channel through which to do it probably'" (id.).

There was then an exchange in which stockholders showed that they were ignorant whether, and were particularly concerned whether, Standard and I. G. sought only to impose group obligations over a general field of operations under a new and broad definition, or whether they actually had a definite and complete process to offer. Mr. Howard did not go into particulars but assured there was a complete process under I. G. patents. He asserted, however:

"Yes; but I think I can tell you gentlemen this, that so far our I. G. friends have not seen any way under which they would be willing to agree to putting their rights, whatever they might be in such a process, into Hydro Patents except under a definition; in other words, I. G. would not be interested in this type of a development except under a definition, I think" (id.).

Again, I. G.'s consent was not necessary for "putting their rights into Hydro Patents," except for licensing after 1947 of that class of patents as to which Standard was to lose control after 1947—and that was an arrangement that

Digitized by Google

Hydro Patents members did not know of. It is a sad commentary that our largest industrial company should promote one of the most important patent pools upon this character of half truth.

Objection was made to dealing with the new rights by a general definition instead of a more particular process description. Mr. Dearborn said:

"If the proposal was made with reference to a process then the definition should not say a process in which so and so, without defining the process. I think you should define the process" (id.).

The ensuing exchange tells us a great deal about the use of definitions of fields in patent-licensing agreements. The definition promoted by Standard covered the general field of catalytic refining, using hydrogen without net consumption of hydrogen. In its support, Mr. Howard employed all the arguments usually used in justification of the patent pool generally. Against it were presented the criticism that, in the first place, the definition was much too broad for any given process, and that in the second place there was no assurance Standard or I. G. had patents rendering the whole of this field available to licensees. It is small wonder that Mr. Howard's proposals were keenly criticized, since an agreement using the proposed definition would freeze the relative balance of advantages in the whole field defined, for a long time to come among all the companies who should be forced to become subordinate insiders or more subordinate outsiders of the new C. R. A. Because of the light thus thrown on the significance of C. R. A., I believe it necessary to quote here at length. Beginning with the objection to the definition the minutes continue:

"Chairman HOWARD. On that point we might not be in agreement. Yes. The decision would be based upon a concrete process ready for use but the definition would not be as limited as the process itself. It couldn't be, in the nature of things. We all know that who have had any experience because it is obviously possible to change any particular process which is offered in many particulars and the only thing that you can do if you follow the lines that we have been all following for so many years is to attempt to define a field which covers the process in question. What we would try to do in the primitive days of patent licensing, people used to talk about licensing a process and its improvements and of course no one ever knew what improvements were and in dealing with that problem over the last fifteen years the oil industry has developed the technique of defining fields to attempt to accomplish what the old patent lawyer meant when he said improvements" (id.).

I intervene to add that the new technique of defining fields instead of referring to improvements does not seem to have accomplished much in the way of remedy for Mr. Howard's complaint that "no one ever knew what improvements were," for it doesn't appear, as we shall see further in 1941, that anyone ever did find out what the hydrogenation field meant. The only thing we can be certain that the new technique of defining fields did accomplish was to encourage initial patent advantage, extending it over patent positions of others, and giving it a self-perpetuating capacity. The old term "improvements" at least gave a fair standard of reference. The definition of fields gives no standard but only a means of asking as much as you are strong enough to get. It can be used for far different purposes than the old term "improvements." I continue the quotation:

"Mr. DEARBORN. I follow you in that, but not in this: It seems to me that if the field is defined as a process in which hydrogen is introduced and not consumed, that field is then an extremely broad field, and Hydro Patents would not necessarily be in a position to present the processes, the various kinds of processes, which might fall within it. It is too broad altogether.

"Mr. BROWN. You mean others might have the rights?

"Mr. DEARBORN. Yes; it seemed to me as to the definition that if I. G. wanted to make a proposal it should be a defined field but confined to a field under which they had the rights under not only the patents covering the use of the hydrogen but also the process per se.

"Mr. BROWN. I see your point there. There always could be someone who held patent rights in that field, but what we are talking about doing, whether we decide it one way or another, is in effect a decision of practically the whole American oil industry and would cover all of the patents so they would have to look out for the Hydro Patents licensees to find that and——

"Chairman HOWARD. Yes; I think Mr. Brown is correct. The question we should think about answering in principle is whether we do desire to create a situation under which we will have the minimum trouble with outside patent rights. That is one of the benefits, probably the principal benefit, of this type of cooperative undertaking. It simply means that the basis of payment to the Hydro

Digitized by Google

Patents Company, and through them the Standard I. G., must be one that is acceptable and, if that is agreed upon and acceptable, then the obvious interest of anyone is to see that they don't have to pay anybody else if possible."

Again I must intervene to ask: What other meaning can there be to this statement than that if the whole American oil industry will agree to pay royalties to Standard-I. G., and if the whole American oil industry will pool all of its patents in the broad field of the definition, and freeze that arrangement over a long term, then the industry won't have to get a license from anybody else. The logic is admirably effective. If you pay Standard-I. G. for the privilege of your renouncing infringement suits and of having everybody else renounce them, then you won't have infringement suits.

The discussion of definition of field versus definition of process continued:

"Mr. DEARBORN. I think we are looking at it a little bit differently. I look at it at this moment, that the use of the hydrogen atmosphere is perhaps a feature, the process might work with it and might work without it.

"Therefore, I speak of the process as distinct from the use of the hydrogen atmosphere, and I think the process might be something available elsewhere and that it might be licensed by some group or another and yet the use of a hydrogen atmosphere might be covered by some of these patents, I don't know, or it might not.

"In other words, is the tail going to wag the dog or is the dog going to wag the tail? In other words, is the definition going to be so definite as to the entire process that the thing will mean something and anybody can use the process in its entirety under the license?

"Mr. BROWN. As I understand this point: Take a patent on catalytic reforming. Take X as a catalyst. Someone owns a patent covering it; there is a catalytic reforming using X as the catalyst, and assume I. G. offers that. You want to know what the license of the I. G. is unless you have a license under the first-mentioned patent.

"Mr. DEARBORN. Yes.

"Mr. BROWN. But when we license under definition, assuming we agreed to anything, any definition of this intermediate zone, then the tail wouldn't wag the dog.

"Mr. DEARBORN. The dog is thrown in.

"Mr. BROWN. The dog goes with the tail.

"Chairman HOWARD. Is what is in Mr. Dearborn's mind the fact that some one of the stockholder licensees themselves might own some of the rights in this and they might feel that they were the dog and what the I. G. might contribute was only the tail?

"Mr. DEARBORN. Yes.

"Chairman HOWARD. Even that, I think, does not get to the root of this question of cooperation or non-cooperation in Hydro Patents because that is simply a trading question of who has the best position. If the I. G. rights, those of Standard I. G., were not complete and the process required a license under the rights of Texas Company as well, obviously the Texas Company has got to receive some consideration or it won't go into the arrangement.

"Mr. DEARBORN. I don't want to continue the argument unnecessarily; but I think you all have my point, and that is that when we went into the hydrogenation agreement with the Hydro Patents Company, we felt distinctly that I. G. and, therefore, the Hydro Patents Company, had a very substantial position covering the field of hydrogenation, that that was a process in itself and a complete whole and a useful process. that the hydrogenation was the meat and substance of the process and now, I may be entirely wrong, but I regard an intermediate zone, the use of a hydrogen atmosphere, as a feature to be attached to a process and not a process.

"I may be all wrong about it. That is the way I regard it and therefore I am trying to inquire whether you think the Hydro Patents can gather together enough patent strength to cover the processes to make it desirable, to also put in the hydrogen atmosphere.

"It would seem to me in that case that Hydro Patents would better go the whole hog and take the processes with and without hydrogen.

"Chairman HOWARD. Well, that latter is a possibility. It is a very ambitious one, but it is a possibility. The first answer to your question is that the attitude of the Standard I. G. Company was that the processes it had in mind in discussing with you gentlemen are processes which it did control completely. It didn't require any rights from anyone else at all.

Digitized by Google

"Mr. DEARBORN. Then the definition of it ought to be drawn to reflect that process" (id.).

Dr. Delbridge then raised a question which went directly to the underlying forces—the existing contractual commitments between some of the H. P. members. He asked:

"Isn't this pretty intimately tied up with the possibilities of differences between the Loyalists and Insurgents and catalytic cracking, regardless of hydrogenation? Don't the things fit in together? To an outsider it looks as if you were just scratching the surface on this thing" (id.).

Mr. Howard replied that he had considered having H. P. centralize licensing of catalytic refining generally but that since Socony had its own arrangemets for the Houdry process, and Shell, Texas, and Sinclair had interests to protect in Universal, therefore—"we already have two groups which are completely out of the sphere of Hydro Patents Company and who have gone along and made their own arrangements in catalytic cracking and it just looked hopeless to try to do anything with that from a general industry standpoint."

Mr. Howard added: "If I were ten years younger I might want to take on my shoulders the job of making Hydro Patents do something constructive for the oil industry in catalytic cracking; but I don't think I have the energy. If you have any ideas, though, Dr. Delbridge, maybe we can make you president of Hydro Patents and let you go along and clean that stable" (id.).

The role of the Hydro Patents Co. in the formation of C. R. A. may be followed from this stage in the successive C. R. A. memoranda. In the London agreement of October 12, 1938, between Standard, I. G., Indiana, and Kellogg, with the partial participation of Anglo-Iranian, the parties "recognized" that some intermediate zone processes might be deemed to fall under the hydrogenation agreements and some might be deemed to fall outside those agreements. It was accordingly expressly agreed that if the oil company members should make use of intermediate zone processes under such conditions that they must pay royalties to Hydro Patents within the United States they would not have to pay any royalties under the C. R. A. agreement.

The further concession to oil-company members was also made that should they be required to pay royalties to H. P. in respect of intermediate zone processes, in that event S.-I. G. would refund to them approximately one-third of the amounts received by it from Hydro Patents Co.'s use of these payments. Since S.-I. G. was in fact entitled to receive from H. P. the whole of such payments to it, S.-I. G. in result would receive two-thirds of the royalties paid by oil company members in such circumstances and would rebate them one-third. This concession offered further inducement to the oil companies invited to become members of the C. R. A. group.

This special protection against duplication of royalties and this concession on hydrogenation royalties were included in the terms of each of the subsequent C. R. A. memoranda until the final draft of July 9, 1940.

Meanwhile, arrangements for the cooperation of Shell and Texas in C. R. A. were worked out. Because of their special interest in Universal a settlement with that company was also formulated. All three were brought within the C. R. A. memorandum of August 15, 1939. Under its terms the parties proposed to throw into Hydro Patents Co. itself the licensing rights for the C. R. A. field, but with the right to license only its own members. The right to license nonmembers was to be given to Universal. The effect of such an arrangement would have been that H. P. would hold the right to grant licenses to the large oil companies of this country, and Universal would hold this right as to the small companies. The foreign licensing rights were to be thrown into I. H. P.

After the war intervened and prevented a contract which would include both British and German companies (exhibit C. R. A. 21), Standard resuscitated the C. R. A. negotiations by its representation to the parties that it had taken over I. G.'s rights and the power to carry out I. G.'s obligations in the C. R. A. field, and would do so under a new corporation to be formed under the name of C. R. A., Inc.

A C. R. A. draft of February 8, 1940, was worked out. For some reason the centralization of American licensing rights in H. P. disappeared from this memorandum. H. P. never thereafter reappeared in C. R. A. Thereafter Standard sought to disentangle any claim that H. P. members had on hydrogenation.

By the time of the final draft of July 9, 1940, Standard, as we shall see further, had formulated the principles of a complete patent settlement with Shell abroad and a solution of the hydrogenation and other questions between them in this

Digitized by Google

country. Standard, representing its own and I. G.'s rights and obligations, Shell, Indiana, Texas, Kellogg, and Universal, with Anglo-Iranian as a party to exchange of licenses and information at favored rates, had arrived at a full basis of cooperation in C. R. A. The four American oil companies represented far and away the leaders of the industry in cracking capacity in this country. For illustration, I introduce a Temporary National Economic Committee chart reflecting relative positions as exhibit 144. Shell and Standard were the two great international oil companies. H. P. had been eliminated. In these circumstances, all previous provisions dealing with the contingency that royalties on intermediate zone processes might be found payable to H. P. were eliminated from the face of the agreement, and were preserved only in separate assurances to the parties.

Apparently, in these circumstances the parties intended to take a determined stand to deny that the hydrogenation field had anything to do with intermediate zone processes, and to definitely disentangle C. R. A. from the hydrogenation agreements. This final draft thus minimized the connection with hydrogenation by eliminating all reference to it except where named in the definitions as one of the processes excluded. The questions raised with the Hydro Patents members were not, however, done with, as we shall see.

I. H. P. remained a party to the final agreement, for I. H. P. served as a vehicle of cooperation between Standard and Shell, being owned equally by them, and did not involve any complication in the form of rights of third parties, except the I. G. royalty interest, which was taken under Standard's wing.

The new course thus steered by Standard in organization of C. R. A. was early asserted. Mr. Howard announced to H. P. members that the use of H. P. for C. R. A. was no longer considered and invited a determination by H. P. that intermediate zone processes did not fall within the hydrogenation field. He combined this announcement with an offer of a special credit to hydro patents members upon intermediate zone processes through their hydrogenation licenses, and also as an inducement to join the C. R. A. pool. Whether the hydrogenation licenses had any real claim on the intermediate zone processes or not, it would seem that something had to be done to disentangle those processes from the confusion Mr. Howard had already wrapped around them in his overtures to the hydrogenation group. In this connection, in a memorandum by Mr. William B. Plummer, of Indiana, dated October 16, 1940, we see the following comment on the credit offered H. P. members on intermediate zone licenses:

"Is it fair from the standpoint of normal third party (non-H. P. stockholder) licensees of C. R. A.? I doubt it, since I know of no consideration flowing from H. P. stockholders to justify the rebate, other than their assent to Standard-I. G. getting itself out of a tangle * * *" (exhibit 145).

Mr. Howard's proposal was stated in his letter of October 9, 1940, to H. P. directors, with copies to stockholders, as follows:

"* * * Standard-I. G. further advises that in the course of its more recent negotiations it found it necessary to give up the idea of proposing that Hydro Patents act as the vehicle for licensing the Hydro Patents stockholder licensees in the Intermediate Zone. However, in spite of this fact and in spite of the fact that the reaction covered by the definition of the Intermediate Zone is different from Hydrogenatiton, Standard-I. G. feels that the Hydro Patents stockholder licensees are, on account of their interest in and contributions to hydrogen technique through their participation in Hydro Patents, entitled to special consideration.

"Standard-I. G. therefore proposes that if Hydro Patents finds the proposed distinction between the Intermediate Zone and Hydrogenation acceptable each of its stockholder licensees should, in paying royalty for the use of Intermediate Zone processes under licenses which include the patent rights of the Standard-I. G., be granted a credit by Standard-I. G. equal to one-half of the "fixed royalties" payable by Hydro Patents to Standard-I. G. under Article V of Contract B of the Hydrogenation agreements" (exhibit C. R. A. 146).

This proposal was not met with unanimous approval. Objections were expressed, as witness letters from California (exhibits 147 and 148), Cities Service (exhibits 149 and 150), and Gulf (exhibit 151).

A resolution was put through a meeting of the H. P. directors reciting that it was the sense of the board that the intermediate zone did not fall within the hydrogenation definition, but referring the question to the stockholders. Similarly adopted, but referred to stockholders, was a resolution that a committee should consider the feasibility and wisdom of liquidating H. P. (exhibit 152).

The stockholders met on January 7, 1941. It turned out there was such general disagreement on what should be done as to the intermediate zone that no

Digitized by Google

vote was called on the resolution touching it. There was also general disagreement as to liquidation of H. P., but a resolution was adopted calling for appointment of a committee.

At the outset, the stockholders' meeting brought about a distinct qualification of the resolutions of the directors. I quote from the minutes:

"Mr. ISOM. I'd like to make a statement at this point, as a Director. At the Directors' meeting at which this Resolution was supposedly adopted, this matter came up in rather a rush at the last minute. The definite resolution was not before us. I understood that we were voting to unanimously submit the question to the stockholders but it was not my understanding that we unanimously agreed as to the substance.

"Mr. LAMONT. I was under that same impression. In other words, when I voted "Yes" I was under the impression it was a vote yes on the question of submitting these questions to the stockholders rather than a yes vote as a Director on the substance of the proposal itself.

"Mr. HOWARD. There was no opportunity to secure approval of the minutes of the meeting in question so the statement is tantamount to a correction of those minutes.

"Mr. LAMONT. Just to make it of record.

"Mr. HOWARD. I think the stockholders all understand the position now" (exhibit 153).

The proceedings at this stockholders' meeting are extremely interesting. Each instance of clash of point of view is a practical representation of a patent pool in the making. Mr. Howard's objective stands out clearly from a reading of the minutes. He sought from Hydro Patents members a relinquishment of all claim upon the intermediate zone process under their contracts and at the same time he sought to avoid a drawn issue with them, or the creation of any impression that he was driving a hard bargain with the stockholders, and sought their favor for association with the C. R. A. project.

On the part of the stockholders, the most positive reaction was expression of a desire for further information as to the nature of the processes involved, the fair meaning of hydrogenation, and the real scope and effect of an amendment that would expressly exclude intermediate zone processes. They particularly wished to know why licensing of intermediate zone processes at such low rates as C. R. A. contemplated could not be worked out through the Hydro Patents Co. under the licenses held by stockholders. The question was especially pertinent, since Mr. Howard had previously emphasized the close relation between hydrogenation and intermediate zone, and since indefinite proposals had been made from time to time that the development be carried out through Hydro Patents. The minutes afforded poignant illustration of these conflicting views and present a commentary on Standard's policies and methods as expressed in the responses given by Mr. Howard.

On the matter of additional information desired by members, we see that Mr. Isom, of Sinclair, said of the resolution of the board of directors as follows:

"As a director, I don't think I had enough information before me at that time, to pass on the particular merits of the question." A question by Mr. Borden, of Cities Service, showed the importance of information to members as follows:

"I should like to say that I wrote up here asking for information concerning what effect this resolution has with reference to the company, and I haven't much of an idea. I have your letter and I have read it, but I don't think that I understand what the stockholders are giving up if they approve this and what the corporation is losing if they give it up. What is the cause for bringing up this question? What is behind the whole thing? We haven't any background" (id.).

Mr. Adams, of Sinclair, pointed to the quandary imposed upon stockholders in their inability to evaluate the hydroforming process, which Mr. Howard stated was the principal intermediate zone to be affected by the proposed resolution. Mr. Adams said that he wished his remarks to "indicate how very little we know about the intended effect and the real purpose of the resolution. In fact, our position would be that at the present time we do not have enough information to pass upon it or to be required to pass upon the resolution."

Mr. Cooke, of Gulf, complained as to the difficulty in choosing between the several interpretations of hydrogenation as stated by Mr. Howard. Mr. Cooke said of this difficulty:

"This points to the fact that the stockholders should be afforded an adequate opportunity to see all of the facts and to reach such conclusions as may be drawn therefrom."

Digitized by Google

There was a lengthy discussion from all sides as to the actual meaning of hydrogenation. Time and again it was Mr. Howard's response merely to reiterate the interpretation proposed by the resolution. He was scarcely in a position to reply categorically that intermediate zone, i. e., refining with the use of hydogen without net consumption of hydrogen, was not or could not be hydrogenation under any circumstances. Mr. Howard had too actively agitated the possibility that such processes might be hydrogenation. Furthermore, the proposal was then being made that Hydro Patents stockholders should receive a credit on intermediate zone royalties against their payments for hydrogenation. Furthermore, if such processes could not be hydogenation, there could be little need for asking the Hydro Patents Co. to adopt a resolution excluding them from hydrogenation. On the other hand, it was equally difficult for Mr. Howard to make the distinct admission that such processes could be hydrogenation, for he was promoting a resolution which would divorce them from the hydrogenation field. He was, furthermore, doing so in order to pool such processes with a different group.

In view of the uncertainty in which the question appeared, the real bargaining positions of the parties revolved around the stockholders' question asking Mr. Howard to explain why it was that the intermediate zone processes could not be developed through the Hydro Patents Corporation. Mr. Howard met this question from several sides. To begin with, he emphasized the high royalties that must be paid under the hydrogenation terms. He said in this connection:

"Those terms are $53 a Barrel in the way of a cash payment to the Hydro Patents Company by the stockholder licensees who propose to install, then a running royalty payment of 5¢ per Barrel on the input to the process and a royalty payment of 5¢ per Barrel on the gasoline output of the process. In addition, there is a payment provided in the companion engineering contracts which the licensees of Hydro Patents have—an engineering fee of 4% of the cost of the hydrogenation plant proper. Those are the general terms of the arrangement. All of those terms would apply to the Hydroforming process if it were within the hydrogenation structure. From a practical standpoint, those terms would be very burdensome terms for the licensing of a process of this character" (id.).

Mr. Howard pointed out that the proposed rate for hydroforming was "something like one-third the rate provided by the Hydro Patents contracts." He thus contrasted the alternatives as follows:

"Just viewing the thing as a practical problem—the Cities Service, if interested in Hydroforming—would it prefer to treat this process as under the hydrogenation definition and pay those amounts or treat it as not under the hydrogenation definition and accept a license under the 5¢ rate, or even say 'I don't need any license,' which it might do without any commitments one way or another" (id.).

Mr. Howard was asked why it was that the hydrogenation rates themselves could not be reduced for the purposes of hydroforming.

Naturally, Mr. Howard did not reply that the real reason was that the C. R. A. partners desired to cover the whole field of catalytic refining. He replied as follows:

"It might be possible to alter those terms. It is extremely difficult, particularly under present conditions, because there are foreigners who have interests in this matter, and it is not possible to cooperate actively with them under present conditions" (id.).

As in 1929, so in 1941 Mr. Howard confused the issues by this misleading reference to the necessity of consent by foreign interests. So far as this concerns I. G., then, except for the necessity of tying up the right to license I. G.'s patents after the year 1948, Standard could without I. G.'s consent reduce the hydrogenation royalties to 2 cents per barrel and set the royalties for other I. G. patents at any royalties fair for the process in question. Standard had no difficulty in making a definite offer to Shell to reduce its hydrogenation royalties in this country.

The reasoning on this question of frozen royalty rates is curious enough on its face. Mr. Howard represented to the stockholders that the rates were frozen in favor of other parties, and that there would be great difficulty in executing new agreements to unfreeze them. But though the rates for hydrogenation were thus to be considered as frozen, there was apparently, according to Mr. Howard's proposal, not the slightest difficulty in simply changing the meaning of hydrogenation so that the frozen rates would not apply. It is curious indeed that respect for another's right should limit their alteration in one way unsatisfactory to Standard but present no limit upon exactly the same alteration in a different way satisfactory to it.

Digitized by Google

The stockholders further raised the point that the stiff hydrogenation royalties were, under the agreements, to come to an end in 1947, so that there was a fair question whether their interests would be better served by high royalties for a short period or low royalties for a long period. Mr. Howard thereupon for the first time asserted that under the agreements the Hydro Patents Co. was free to charge its members after 1947. The threat was plain in view of the controlling interest in Hydro Patents Co. held by Standard itself and the other C. R. A. members. There was a sharp dissent. Mr. Howard's emphasis in the 1939 meeting on the cessation of I. G. royalties was quoted. The conflict in view was stated as follows:

"Mr. HOWARD. In 1947 Hydro Patents Company is relieved of all obligation to pay to Standard–I. G. any further royalties, but the individual stockholder licensees of Hydro Patents are not relieved of their obligation to pay Hydro Patents Company, so far as I know.

"Mr. COOKE. That was not our view, as we understand the agreements.

"Mr. HOWARD. I can only tell you that that was my understanding—my intention that the agreements had that effect" (id.).

At this time Mr. Howard was not only Standard's representative at the Hydro Patents Co. meeting, but he was also the president of Hydro Patents Co. and a director. Speaking in these capacities, he was apparently able to advocate the desires of Standard from any side that one approached the question, regardless of consistency. We have seen that in the 1939 stockholders meeting Mr. Howard frankly reduced the whole question of self-interest to be decided by each stockholder, in view of what Mr. Howard then represented as the entire impossibility of actually determining the meaning of the definition of hydrogenation. In the meeting of 1941 the question of decision by self-interest was handled from both sides. In his opening statement, Mr. Howard, upon the reasons we have noted, sought to prove that self-interest was not to be served by inclusion of hydroforming in hydrogenation and he therefore concluded:

"So that whereas as business people and human beings we probably all approach this question from a standpoint of self-interest, desire, or feasibility, we are ultimately driven through the practical consideration I have mentioned to start where we ought to have started and that is to look at the contracts to see if the process in question is really within the terms of the grants. We should now turn and look at the problems as open problems and that was in the main the discussion of the Board of Directors at their meeting. What was the interpretation of the technical definition in the contract and did the new process come within the terms of that definition?" (id.).

After getting nowhere in finding out what the definition of hydrogenation meant, Mr. Cooke, of Gulf, returned to the question of whether the hydrogenation royalties expired in 1948. Mr. Cooke made the point as follows:

"The question of time is as important as any because this is the first suggestion that I have ever heard of, in my limited experience with these agreements, that the royalties may go on after 1948 and certainly from an economic standpoint that would have a most important effect on the decision that Gulf Oil Corporation would make" (id.).

To this plain statement as to the royalties affecting the stockholders' choice, Mr. Howard replied with lofty repudiation of self-interest as a proper basis for decision. He said:

"It is perfectly natural for you to approach it from that standpoint, but I am afraid, without any disrespect, that that standpoint is really short-sighted and not practical—the standpoint of attempting to decide the selfish interest of each company and of Hydro Patents in approaching the technical problem of trying to decide a debated issue of what is and what is not hydrogenation—is a wrong approach, I believe, and if we once get ourselves wedded to that method of approach on these problems I am afraid this whole structure will be recognized as too cumbersome to be of any practical value to any of us" (id.)

In spite of the fact that in these relations with the oil companies representative of the American oil industry, from whom Standard had collected large sums for positions under the hydrogenation agreement, Standard resorted to every measure of persuasion and diplomacy to gain its ends, it is also clear that Standard did not intend to bring this agreement into court, which would indeed have been a complete departure from its policy adhered to to date, without exception, of never bringing to court either its contracts with I. G. on any subject or any of its pool agreements. In this meeting Mr. Howard refrained from taking any single fixed stand in direct opposition to the views or position

Digitized by Google

of any stockholder, and he made it clear that no irreconcilable stand would be taken. I quote:

"I am afraid that we will not be able to proceed with any of these plans against the resistance of any substantial proportion of the stockholder licensees of Hydro Patents, and if two or three of them feel that they are not being fairly treated in this matter, as far as I am concerned that ends the particular matter" (id.).

The stockholders might well have felt, as a result of the sessions of Hydro Patents seeking the meaning of the hydrogenation contracts, that they had been participating in the following dialogue in "Alice Through the Looking Glass":

" 'When I use a word,' Humpty Dumpty said in rather a scornful tone, 'it means just what I choose it to mean—neither more nor less.'

" 'The question is,' said Alice, 'whether you *can* make words mean different things.'

" 'The question is,' said Humpty Dumpty, 'which is to be master—that is all.' "

The quotation might well be carried through to its conclusion:

" 'When I make a word do a lot of work like that,' said Humpty Dumpty, 'I always pay it extra.'

" 'Oh!' said Alice. "She was too much puzzled to make any other remark."

Because of the general disagreement expressed, it was decided that no vote at all would be taken at the meeting upon the proposed resolution that intermediate zone processes be excluded from hydrogenation.

The resolution for appointment of a committee to consider the wisdom and feasibility of liquidating Hydro Patents Co. was passed, but not without further objection and criticism. The particular wish was expressed that before considering liquidation, Standard itself should make some definite proposal as to the ultimate arrangement to be made in respect of intermediate zone, or as to the particular objects to be accomplished by liquidation. However, the real effect of liquidation in connection with the intermediate zone question obviously was that Standard and the C. R. A. group, who were, in principle, now consolidated, would thus be enabled to negotiate a deal with each company separately for definition of such company's rights under its hydrogenation license. Standard would thus avoid the necessity of settling the question with all the oil companies at once. That had been desirable as the most complete creation of group obligation as to the intermediate zone, but in view of organization of the C. R. A. group it was no longer indispensable, and so long as group agreement could not be obtained it was better not to have to deal with the group.

I have no direct information on the subsequent developments as to H. P. The consent decree declared the hydrogenation plan unlawful and ordered dissolution of Hydro Patents Co. and Hydro Engineering & Chemical Co., except as dissolution might be prevented by refusal of other stockholders. The decree gave the licensees the right to take unrestricted licenses for the hydrogenation processes royalty-free during the war, and at reasonable royalty rates thereafter.

STANDARD AND SHELL IN C. R. A.

We have seen the importance of Shell in any solution by Standard of the C. R. A. negotiations. Shell foreign was half owner of the hydrogenation process outside the United States. Shell domestic did not have an equal position within the United States. Because from the beginning Standard promoted C. R. A. as a pool tying partly into hydrogenation, an understanding with Shell was indispensable. Settlement with Shell in the United States was also necessary to obtain its cooperation abroad. Thus American patents alone did not fix the terms under which American patents should be enjoyed under C. R. A. Foreign rights resting upon the contracts among the parties were a major influence upon the disposition of American rights.

Mr. Howard wrote Mr. H. Jacobson of Shell on October 19, 1938, a running account of the negotiations that had resulted in the London agreement of October 12, 1938, and appealed to Shell as follows:

"It appears that the natural thing for the Shell Company to do in connection with this development is to take up a position alongside the Standard Oil Company of New Jersey, both in the U. S. and outside the U. S. since in this way, and apparently only in this way, is it going to be possible to have the most orderly and efficient development of the catalytic cracking process in connection with the hydrogenation process" (exhibit 154).

Digitized by Google

Shell was, from the beginning, however, very much opposed to the view that the intermediate zone processes had anything to do with hydrogenation. Its opposition was natural since it did not hold a position equal to Standard's as to hydrogenation in the United States. Shell, resting its position squarely on the wording of the hydrogenation agreement and the chemistry of the processes, stated in a letter of February 3, 1939, by Mr. D. Pyzel of Shell to Mr. Howard the following:

"We still do not see any justification for the establishment of the intermediate zone. If I understand your reasoning right, the intermediate zone comprises processes carried out in the presence of purposely added hydrogen, but in which no hydrogen-addition can be definitely determined, because more free hydrogen leaves the reaction space than has been introduced to it. This would, in our opinion, place such processes unquestionably outside the hydrogenation field, as defined in the hydrogenation agreements. However, you maintain that, as it is *not impossible* that some hydrogenation-reaction *might* take place inside the reaction space, we have to give the owners of the hydrogenation patents the benefit of the doubt and oblige ourselves to pay them a royalty for using a perhaps not impossible but decidedly not determinable reaction, and to have defined by arbitration what degree of probability of such a reaction can be assumed, the royalty to be paid during the full hydrogenation royalty multiplied by a fraction representing that degree of probability" (exhibit 155).

This letter also went on to point out that, by the same reasoning, in view of the possibility of the release of hydrogen from hydrocarbons under catalytic treatment, and the possibility that some of this hydrogen might be added into some of the materials under treatment, therefore all catalytic processes might be argued to fall within hydrogenation, even though no free hydrogen were added.

The consequence of Shell's view was stated as follows:

"I hope that the foregoing will make it clear to you why we cannot feel the justification of establishing the idea of intermediate zone and of the effort to bring that zone into the hydrogenation field, whereby we would commit ourselvs to payment of royalties to Hydro Patents or Standard-I. G."

The letter included, however, an invitation as follows:

"I still hope that we may be able to work out some way of cooperating, instead of going separate ways which will probably lead to conflicts later."

By letter of February 7, 1939, Mr. Howard, in reply to Mr. Pyzel, suggested means of cooperation. Mr. Howard reiterated the necessity of agreeing about the intermediate zone as follows:

"(3) It would probably be easier for your company and our own to cooperate with one another and with the I. G. if we could arrive at a common agreement concerning the Intermediate Zone. In the absence of such an agreement between the three of us there will be some difficulty about technical cooperation in certain phases of the hydrogenation business.

"(4) As between Shell, Jersey, and I. G., considered as one group and Universal, it would tend to harmonious and helpful relations all around if there could be an agreement covering the Intermediate Zone" (exhibit 156).

The letter acknowledged that "* * * it would be helpful if some means could be found to equalize the interests of the Shell Union Oil Co., and the foreign Shell group, in the hydrogenation situation." Mr. Howard also reiterated that he would try to obtain from I. G. a modification of the hydrogenation contracts in case the H. P. members wish to include the intermediate zone within their license.

The difficulties with Shell explain why Universal ultimately became a party to C. R. A. Mr. Howard's letter of February 3, 1939, to Mr. E. J. Sadler, refers to a hostile move on the part of Shell and Texas as follows:

"The ostensible reason for their refusing to come into our arrangement was that the new combination would take business away from Universal Oil Products, in which all the parties had a financial interest, and that the right thing to do was for everyone to back Universal. We of course admitted the desirability of protecting Universal's interest, and made the best proposals we were able to make to cover this situation, but no agreement could be reached with Universal. To protect themselves, Texas, Shell, and Universal hurried through an agreement which was in substance an agreement to stand together against our group" (exhibit 157).

Digitized by Google

Although out of the alliances among the parties Universal ultimately arrived at a C. R. A. membership, in the capacity of grantor of its patent rights, and grantee of licensing rights, the view expressed in this letter as to Universal's position was as follows:

"As to the actual status of the Universal Oil Products Company catalytic process, we are advised that they had nothing whatever except laboratory work on catalytic cracking until three weeks before the Petroleum Institute meeting. At this time they changed over a pilot plant running on gas dehydrogenation to make it a catalytic cracker. They reported yields were obtained by cycling the charging stock five times.

"So far as we can learn, all that Consolidated, Texas, and Shell propose to install at the present time are pilot units. We do not believe Universal has, as yet, anything more than the vaguest idea of how a satisfactory commercial plant could be built."

The commercial motives combined in Standard's patent negotiations with Shell upon C. R. A. appear in the minutes of a conference held between Standard and Shell in the latter's St. Helena's Court offices in London on March 16, 1939, on the subject of their foreign-patent rights, as follows:

"It does not seem at all sensible to permit a continuation of the present situation under which Shell and Standard are sometimes found competing with one another in improving the efficiency and competitive power of third parties, nor is it constructive for Shell and Standard to make unnecessary alliances with partners in the field of patents and processes where the advancement of the interests of the partners is inconsistent with what would otherwise be dictated by the joint interest of Standard and Shell" (exhibit 158).

A letter of March 24, 1939, from Mr. Howard to Mr. J. B. A. Kessler, of Shell, emphasized further objectives to be gained by combined hydrogenation and C. R. A. settlements as follows:

"We could then undertake as a second stage of the matter to work out in Europe the merger between S. I. G. and I. H. P. patent rights, this being a matter in which nobody in America would then have any interest" (exhibit 159).

Standard continued to seek curtailment of competition between itself and Shell in licensing foreign patents as noted in the following in a letter of March 31, 1939, from Mr. Howard to Mr. Sadler.

"This will confirm our discussion of today concerning the desirability of trying to work out some solution of our most pressing oil patent problems, along the following lines:

"(1) Jersey and Shell to set up a joint agency in London for the coordination of the licensing of their own patent rights and, to the maximum extent possible, of all other patent rights which they separately or jointly control, or can arrange to take over on advantageous terms. The three basic objectives of this plan are to—

> "(a) prevent Shell and Jersey from injuring their respective commercial interests by competing with one another in dealing with third parties outside of the U. S. in the licensing of their own processes;
>
> "(b) permit the American technical developments in the oil industry to be coordinated and present a united front against the world outside of the U. S., not only for Jersey and Shell but for other American companies whose processes may be taken over for exploitation outside of the U. S. on partnership, commission, or other bases by the London coordinating agency;
>
> "(c) provide a definite organization in which all patent responsibilities, information, and negotiation will be centered for the Jersey and Shell groups,
>
> * * * * * * *

"(2) In order to make effective the plan above outlined it becomes necessary for Jersey and Shell to settle their present patent differences inside the U. S. Both parties have commitments to others which make this a difficult task" (exhibit 160).

Mr. Howard then elaborated a plan in which the outline of the C. R. A. draft of August 15, 1939, begins to appear. He accompanied it with this observation:

"Is a necessary corollary to the above arrangements, Jersey and Shell probably would have to exchange licenses with one another for the whole world."

Digitized by Google

The following report to Standard's board was made on June 15, 1939, on this subject:

"*Hydrocarbon synthesis agreements and catalytic cracking agreement.*—With respect to the over-all negotiations revolving about the hydrocarbon synthesis agreements, Mr. Howard advised that a major complication was the fact that the domestic U. S. Shell interests, which are not yet licensed under hydrogenation patents, fear that under the proposed general statement they might have to pay large royalties to Jersey for the new intermediate zone processes which are at present in the first stage of development and in the perfecting of which Shell itself presumably would have a substantial part. This complication stands in the way of Jersey and Shell, as a necessary corollary to all the other arrangements, effecting a program under which each could mutually exchange with the other licenses under their respective patents in the petroleum field for the whole world.

"As a solution of the difficulty Mr. Howard and Mr. Pyzel have discussed the sale of a paid-up license to the Shell Union Oil Corporation by Standard-I. G. under all of the hydrogenation processes (including the hydrogenation share of the Intermediate Zone Process). The basis of the sale discussed was $500,000 to $600,000 in Universal 'A' Notes. As an isolated transaction this price would be low, but as a means of effecting the over-all settlement it would seem to be a good trade. Another new factor which has been indicated since the last summary of the situation given the Committee by Mr. Howard is that the interested parties now feel it is desirable to provide for the actual negotiation of license contracts for the whole Western Hemisphere in New York rather than in Europe" (exhibit 161).

I quote in full the following succinct statement reflecting the ultimate arrangement proposed between Standard and Shell as outlined in a letter of August 12, 1940, by Mr. Howard to Mr. D. Pyzel, of Shell:

"I wish to confirm our recent discussion of certain arrangements to be entered into between Shell and ourselves as follows:

"1. There will be an equalization of the Shell group and Jersey group holdings of Universal 'A' notes, this equalization to be as of August 15, 1939. As a result of this equalization Shell will in essence receive a paid-up license as regards

"(a) Jersey's share in any amounts payable by Shell for Shell U. S. A. operations of the Hydrogenation Process;

"(b) Jersey's share in amounts payable by Shell to C. R. A. Inc.'s 'general account' on account of Shell U. S. A. operations of Intermediate Zone Processes of Class I and Class II.

"2. There will be an echange of patent immunities between the Shell group and the Jersey group worldwide for the broad petroleum field. This exchange of immunities would not include the chemical field. It has not yet been decided whether the field of production patents should be included. The decision on this we are willing to leave to you.

"As a result of the combination of arrangements outlined in 1 and 2 above it appears obvious that Jersey will receive in essence a paid-up license as regards amounts payable to Shell by Jersey interests under the Polyhydro deal as a result of Jersey's operation of the 'low pressure process'" (exhibit 162).

Out of these intricate commercial, industrial and technological relationships was the pattern of the C. R. A. patent licensing pool woven together.

STANDARD AND I. G. IN C. R. A.

As early as July 20, 1938, Standard and I. G. sought to formulate a special arrangement between them for development of a catalytic cracking pool. A new benefit was to be given I. G. as stated therein in the following:

"I. G. is entitled under the Four Party Agreement to 20% of the royalty received by S.-I. G. I. G. is not obligated under the Four Party Agreement however to undertake any research work in any special field at all. The foundation of the agreement described in today's supplementary 'First Complete Draft of Catalytic Cracking Agreement' is that the I. G. obligates itself to undertake and maintain an active program of research in the defined field, this being the consideration for the basic royalty payments which all the parties agree to make to I. G." (exhibit 163).

We may notice at this point that I. G.'s additional share in royalties, resting on the foundation of proposed I. G. contribution to research, was carried all the way through the later C. R. A. arrangements, even under those negotiated

Digitized by Google

after the outbreak of war, although obviously no fruits of I. G. research would be forthcoming during the war and although the additional royalties would continue to come due during the war. It is no wonder that Texas objected about this in a "Memorandum to Mr. Frank A. Howard," dated August 21, 1941, containing the following:

"* * * it has been our understanding that the payment by the oil companies of a definition royalty of 5% cent for catalytic cracking was justified entirely on the ground of future research and developments to be made in Germany, and we have no assurance that any research along these lines is being carried on and data being accumulated, and certainly in any event no data and information can be available to us during the continuance of the war.

"On the other hand, all of the oil company parties have actively continued research and development along those lines and are accumulating and exchanging technical data and information of value.

"If the fact that the oil company parties have definitely refused to permit any information and data to be given to Germany is considered as an offset, then it would be of definite interest at the close of the war to ascertain whether Germany has carried on any research and development work which they would then be in position to exchange. Certainly, if Germany has done no work some adjustment would be necessary * * *.

The foregoing analysis leads to the suggestion that Standard Catalytic Company agree with the oil company parties that it will hold the 5% cent payable by the oil company parties for catalytic cracking in trust for the oil companies and will not turn it or any technical data or information over to Germany at the close of the war without the consent of the oil company parties" (exhibit 164).

The proposed research was to be financed by royalties. Meanwhile, as to the period before receipt of royalties, it was provided in the cited draft of July 20, 1938, as follows:

"Jersey *agrees to advance I. G.'s share* of the funds required for the conduct of interim research, and I. G. agrees to pay back such sums to Jersey out of first net royalties available for distribution." [Italics supplied.]

It was pointed out in an unsigned Standard memorandum of August 17, 1938, that Standard's advance to I. G. of I. G.'s contribution to research would not be repayable unless royalties were in fact received.

At the time of the London agreement of October 12, 1938, Standard and I. G. initialed their own side agreement, which extended the basic four-party agreement of November 9, 1929. By this document, dated as of October 13, 1938 (exhibit 121, supra), I. G. waived the right to have returned to it after 1947 its hydrocarbon field patents outside of hydrogenation acquired by I. G. after 1941.

The arrangement for concealment of payments to Standard under the guise of payments to be made to I. G. under the C. R. A. agreement is plainly shown by the following quotation from article IV of this side agreement between Standard and I. G., reading as follows:

"Under the general agreement, S. I. G. has agreed to credit to I. G. a certain specified part of S. I. G.'s revenues from licensing third parties under processes coming under the definition of catalytic refining, and further to credit to I. G. the whole of those payments which are made to S. I. G. by the oil company parties for their operations coming under said definition. Under the provisions of the Four Party Agreement, I. G. would be entitled to 20% of the amounts thus credited to the account of I. G."

The parties then, pursuant to this recital, made the arrangement for the additional compensation to I. G. for its contribution to research, to be made out of the payments which by the main agreements were ostensibly to be made entirely to I. G. This overriding additional compensation to I. G. was to be in the amount of two twenty-fifths of royalties from Standard's operations and six twenty-fifths of royalties from operations of others. A limit of $2,000,000 was placed on the additional compensation.

The following provisions are interesting sidelights on the nature of the undertaking as to research:

"I. G. and Jersey agree to act as a unit to the end that expenditures for the interim research outlined in the general agreement shall be held at the minimum consistent with proper conduct of the business. I. G. and Jersey will jointly endeavor to arrange that the maximum possible part of the necessary interim

Digitized by Google

research is done by the parties to the general agreement themselves for their own accounts. The proportion of I. G.'s contribution to the fund for the interim research shall be 20% of its nominal contribution as fixed vis-a-vis the other parties to the general agreement. This arrangement, however, does not affect in any way the moral obligation of I. G. to undertake its own research programme in Germany in this field."

Standard was in a position to facilitate this new contractual arrangement with I. G. by converting many of its commitments to subsidize I. G.'s research into obligations to deliver oil in Germany in payment, as we see in a letter of December 29, 1938, from D. A. P. G., Standard's Germany subsidiary to Mr. D. L. Harper (exhibit 165).

A letter from Mr. W. E. Currie to Mr. Morrell E. Clark of March 1, 1939, states very simply the arrangement under which I. G. appears to come into the C. R. A. agreements for the purpose of granting its own rights, although they had already been granted to S. I. G. This statement is as follows:

"I. G., through our so-called 'Four Party Agreement', has already given Standard-I. G. licensing rights but it was thought desirable to have this right appear direct here (exhibit 166).

A memorandum of Mr. Howard's, dated May 4, 1938, outlined the advantages Standard relied upon in its position in regard to I. G.'s patents, and explained the way in which Standard proposed to turn that relationship to advantage. For its value as an explanation of the purposes underlying the form in which the I. G. interest was stated in all the subsequent negotiations and drafts of agreement, I quote the following:

"Our third objective in the catalytic cracking development is to obtain some direct cash return from the outside world for the use by outsiders of our patent rights and technical developments and information. Our patent assets, for which we are entitled to a return ,are not only those which originate (or are acquired by) the Jersey interests, but also those in the same field originating with I. G., which latter patent rights come under the agreements of 1929. According to these agreements Jersey is entitled to a varying share from a minimum of about 37½% to a maximum of 80%, depending on the exact invention and its field of application. For practical purposes the revenue from the catalytic cracking patents of I. G. outside of Germany will we believe fall almost entirely under the 80% bracket. It therefore follows that whatever participation the I. G. have in the Kellogg/I. G./Anglo-Iranian combination can be sidered as 80% Jersey participation. We have also to consider that, unless some other arrangement is made with I. G., Jersey itself will be obligated to pay to I. G. on account of any I. G. invention in catalytic cracking which it uses, 20% of a fair royalty for such inventions.

"In view of all these circumstances, it would seem that our best course is probably not to propose any direct participation in the revenues collected by the Kellogg/I. G./Anglo-Iranian combination, as a condition for putting our own patent rights into that combination on the non-exclusive basis—which seems to be the only one consistent with the second objective—but to rely for our cash return on the following: (1) on our 80% participation in I. G.'s share; (2) on the release by I. G. of their claim for any royalties on account of our operations.

"As additional reason for preferring this course would be that it puts the Kellogg combination in better shape to insist upon similar treatment from other oil companies, for example Standard of Indiana, California, Texas, etc. If Jersey asked for a direct participation in exchange for putting its rights into this Kellogg combination the other oil companes would find it very difficult to accept any basis less favorable, and in the long run this would result in whittling down the I. G. share to such a point that we would lose more through that route than we would gain through our direct participation.

"Our present conclusion therefore is that we should advise Kellogg that we are willing to join the proposed combination on the basis of putting in our patent rights on a non-exclusive basis, subject to the condition that they should not be licensed except to those who license us; that we should take a free license from the Kellogg combination, including I. G. itself, in return; but should ask no cash participation" (exhibit 166).

A memorandum prepared for Standard's executive committee, dated October 28, 1938, in explanation of the London agreement on C. R. A. processes and the

Digitized by Google

prospects of inviting Shell and Texas into the pool, gives the following further account of the role of I. G. in Standard's negotiations:

"All parties realize that Jersey has an interest in S. I. G. and that the royalties paid by the member companies to S. I. G. will go in part to I. G. and in part to Jersey. Our arrangements with the I. G. in connection with these processes are so complicated and in some respects so confidential, however, that we have always refused to discuss with the other parties the exact basis on which I. G. and ourselves participate in the S. I. G. royalties. An example of this complication is the following: In the application of our basic contract with the I. G. to the catalytic cracking situation, it was determined to be equitable that the I. G. should receive, over and above their normal participations, a certain substantial additional participation lying between $1,000,000 and $2,000,000—the former being our offer, and the latter their request. Efforts have been made to settle this difference between the parties along various lines, and the line which now seems most probable is that the entire amount will be paid to the I. G. in oil, I. G. giving the D. A. P. G. an option to purchase this oil in Marks at a specified premium price. There is great opportunity for misunderstanding and injury to our interests from any discussion of the relations between ourselves and I. G. in connection with these S. I. G. contracts and it is hoped that everyone will adhere consistently to the policy of ignoring completely the Jersey position in S. I. G. and treating S. I. G. as a separate entity, the internal affairs of which will not be discussed—either inside of our own organization or with others. Specifically, in the present instance all the member oil companies are accepting our assurance that Jersey will pay the S. I. G. exactly the same royalties which all the other operating companies pay to the S. I. G. They know that, to the extent this arrangement is tied in to the original Jersey hydrogenation arrangement with I. G., both Jersey and I. G. finally divide between them in some way the royalties paid in to the I. G.; but we have expressly declined to inform the other member oil companies what this division is, or the exact extent to which the interests of I. G. and Jersey in this catalytic arrangement overlap their earlier arrangements in connection with hydrogenation" (exhibit 167).

Thus it is clearly reflected that though the industry knew Standard and I. G. each had some interest in S. I. G. royalties, the industry did not know that Standard through S. I. G. already controlled all I. G. patents throughout the petroleum field. The industry knew of a merger of interests in "the original Jersey *hydrogenation* arrangement with I. G."—but not in the whole oil-refining field.

At the time of the C. R. A. memorandum of August 15, 1939, a separate paper entitled "Memorandum Regarding Shell and Jersey Royalty Payments," was drawn to provide a separate agreement between Standard, Shell, and I. G. as to royalties payable to I. G. from C. R. A. operations by Standard and Shell under foreign patents (exhibit C. R. A. 48). I call attention to this paper, since, after the war began, an arrangement was drawn up whereunder Standard was required by I. G. to obtain Shell's assurance to resume these payments to I. G. after the termination of the war.

Outbreak of the war interrupted consummation of the C. R. A. memorandum of August 15, 1939. Standard thereupon endeavored to resuscitate C. R. A., as we note in the following cable of October 20, 1939, from Howard to Ringer:

"Ringer all parties including Indiana appear favorable to proposed reconstruction C. R. A. discussed in the Hague. Stop. We are now trying to overcome some objections raised by counsel for several parties" (exhibit 168).

A note of Mr. Howard's committee meeting remarks attached to a memorandum dated November 14, 1939, describes the attitude with which negotiations were carried forward as follows:

"Upon completion of that agreement, the war intervened because our grouping of interested parties included Americans, British, Dutch, Germans, and the war introduced quite a number of complications. How we are going to make these belligerent parties lie down in the same bed isn't quite clear as yet. We are now addressing ourselves to that phase of the problem and I hope we will find some solution. Technology has to carry on—war or no war—so we must find some solution to these last problems" (exhibit 169).

In September 1939 Standard acquired I. G.'s 20 percent interest in the stock of S. I. G. Standard continued, however, to refer to I. G. for its approval of all questions arising in the C. R. A. negotiations. Standard continued to act as a partner loyal to joint interests rather than as 100 percent owner of property transferred to it, in spite of the fact that Standard not only had, to begin with,

Digitized by Google

all of the I. G. patents under the four-party agreement, but now had also all of I. G.-S. I. G. stock. I. G. delivered to Standard, under date of September 5, 1939, a statement of its wishes in regard to further reconstruction of the C. R. A. memorandum of August 15, 1939. It states the following:

"Under present conditions it is of course impossible for us to enter into any agreement to which enemy subjects are parties. We recognize, however, that to a very large extent the patent rights originating with us and which are dealt with in said documents, are in fact the legal or equitable property of Standard-I. G. company. We are prepared to convey to Standard-I. G. Co. the remainder of such patent rights and all technical knowledge and information which we would have brought into the said proposed agreement, provided * * *" (exhibit 170).

I. G. attached the condition that it shoud not be required to furnish information if prohibited by the German Government, and that Standard-I. G. should not furnish to it information where this would be contrary to regulation by government authority controlling any party in question.

I. G. expressed to Standard in this document its view of future cooperation, as follows:

"We understand that in view of our interest it will be the policy of the S. O. Deve. Co. to consult us on important questions arising in the conduct of the enterprise and that when conditions permit S. O. Deve. Co. will propose to all parties that direct cooperation between all parties as contemplated in the memorandum of August 15, shall be established."

Under date of November 3, 1939, Mr. Howard delivered to the C. R. A. partners an announcement that Standard had acquired all the capital stock of S. I. G., and that S. I. G. would assume all the obligations to the parties which had been assumed or would have been assumed by Standard and I. G., and also that—

"Correspondingly, all considerations and obligations running to Standard-I. G. Company, Standard Oil Development Company, and I. G. Farbenindustrie, A. G., by any or all of the other parties to the memorandum of August 15 would run to, or acrue to the benefit of, Catalytic Patents, Incorporated" (exhibit 171).

The announcement also pointed out that failure to perform any obligation on account of the war should not be considered a breach or invalidation of the agreement, or constitute any failure of consideration. Thus it would follow that special royalties originally created on the basis of I. G. research would continue to be payable to C. R. A., Inc., although the research could bear no fruit during the war.

The British partners to C. R. A. were afforded an opportunity to complete the C. R. A. pool on the basis of Standard's representation that it was now entire owner of the company that would hold the pooled Standard and I. G. patents. Standard's acquisition of I. G.'s stock in S. I. G. had, however, made little change either in I. G.'s rights or in the relations between Standard and I. G. I. G. remained entitled to the same percentage of royalties to be paid upon patents that it had transferred to S. I. G., for its rights arose under its separate contracts with Standard and not by virtue of its stock ownership. By virtue of the original agreement of 1929 it was still entitled to stated amounts of royalties, and by virtue of its subsequent separate C. R. A. agreements with Standard it was entitled to additional overrides. The stock ownership, outside of its share in a nominal $11,000 per year income set apart by the contracts, had represented nothing but a minority voice in management of the company. In spite of the surrender of stock ownership, I. G. continued to exercise a voice in arriving at the terms upon which the former I. G. patents should be pooled in C. R. A.

I file herewith a memorandum by Mr. F. R. Loofbourow, dated January 30, 1940, and listing the continuing interest of I. G. in C. R. A. royalties, including both the original 20 percent and the C. R. A. override payable to I. G.

At the same time that Standard represented to the C. R. A. partners that it had acquired 100 percent of the stock of S. I. G., Standard worked out an arrangembent to place the patents acquired from I. G. in trust in order to prevent them being held by a corporation 100 percent of whose stock had come into Standard's hands and, consequently, to prevent the flow of patent rights to third parties under existing contracts giving them rights to patents held by 100-percent Standard subsidiaries. A similar arrangement was made to place the Jasco stock transferred by I. G. in trust. Throughout Standard's conduct bearing on its relation with I. G., it appears to have played what was nothing more than a shell game: now you see it, now you don't. Much later than this

Digitized by Google

period, Standard was still, at the 1941 hydro-patents meeting, representing to stockholders that because of foreign interests there was great difficulty in lowering the hydrogenation royalties or otherwise unfreezing the royalty structure. To C. R. A. partners, however, the representation was made that Standard was the sole owner of I. G.'s interests. To parties entitled by existing contract to licenses under Standard's patents, the ownership was still a different one, being that of a trust arrangement for stalling outright Standard ownership. I quote a letter from Mr. Howard to "Dear Fritz," evidently Fritz Ringer of I. G., dated January 12, 1940, giving the following account of the trust arrangement:

"I am enclosing copies of two trust agreements, one dealing with Standard-I. G. patents, the assignments of which were given to me at The Hague, and the other with the Jasco shares. In the rearrangements effected during August and September Jersey would have become owner of 100% of the capital stock of S. I. G. and S. I. G. would have acquired title to all the patent rights originating with I. G. in the field of the Four Party contract. Similarly, Jasco would have become a 100% Jersey corporation and would have taken title to all the patent rights.

"This situation troubled me a great deal because I was afraid that, through the unforeseen operation of past contracts or through inadvertence in drawing future contracts, the patent rights of S. I. G. and of Jasco might become intermingled with those of Jersey, and pass to others as a part of general agreements binding Jersey and all of its 100% subsidiaries. It was also very much in my mind that although Jersey was the bona fide owner of 100% of the capital stock of Jasco and of Standard-I. G. and these corporations were, in fact, entitled to the patent rights to be assigned to them, there were in both cases complicated relationships between all the parties, created by the original contracts, and these relationships would always have to be borne in mind in anything that was done with the patents of these two corporations.

"It therefore seemed wise to set up some mechanism by which special consideration would always have to be given before any action could be taken which would affect the patent rights of S. I. G. or Jasco. This has been accomplished by placing the patent rights of S. I. G. in trust, subject to the terms of the Four Party Agreement, and by placing 50% of the voting stock of Jasco in trust, subject to the terms of the memorandum which we drew at The Hague. I believe these arrangements will fully protect the interests and rights of all the parties. I must say that I was considerably troubled in my own mind until I worked out this mechanism, because I felt that I was carrying too much personal responsibility" (exhibit 172).

I file, as exhibit 173, documents illustrating the various assignments of patents in the S. I. G. and Jasco fields made by I. G. after outbreak of war in Europe, showing the various forms in which they were assigned and reassigned to conform to this true device.

I call attention to the fact that by letters of March 29, 1940, April 19, 1940, and March 17, 1941 (exhibit 173, supra), between Standard and I. G., it was arranged that during the war I. G. should, on its developments (presumably in fields assigned to Standard), file applications in France and England in Standard's name.

Under the terms by which I. G. had authorized Standard to continue the C. R. A. negotiations, I. G. was protected against further disclosure of information, but I. G. continued to receive information from Standard. In the course of the further negotiations with the C. R. A. partners, the decision was arrived at by March 18, 1940, to discontinue further disclosure to I. G. At the time this was decided, and instructions sent out on March 18, 1940, we notice that Dr. Beller of I. G. was at that very moment in the Standard laboratories and had to be informed of this decision (exhibit 174).

When Mr. Howard sailed on April 13, 1940, to confer with the I. G. representative (exhibit 175), he took with him the C. R. A. memorandum executed as of April 12, 1940, and also a redraft of a "C. R. A. agreement between Jersey and I. G.," dated April 11, 1940 (exhibit 176). There were numerous supplementary papers initialed by the parties at the time of the draft of April 12, 1940, covering various particular angles of the negotiation. Among these was a paper initialed by the parties, dated April 13, 1940, reciting the understanding that none of the technical information to be exchanged should be passed on to Germany or any of its allies, or to any companies or nations of Germany or its allies until after the termination of the war (exhibit 177). (See also exhibit 178.)

Digitized by Google

As an instance of Standard's continued deference to I. G. for its decisions in C. R. A. matters, we note that by letter of April 13, 1940, Mr. William B. Plummer, of the Standard Oil Co. of Indiana, raised a particular detailed objection to the draft of April 10, 1940, and explained that Mr. Howard had assured him "that he would discuss the matter with Dr. Ringer and at least find out what Dr. Ringer's previous understanding had been relative to our position and rights" (exhibit 179). On this point, a Standard cable of April 22, 1940, requested Mr. Howard to take this point up with Dr. Ringer as follows:

"Since Indiana pays on definition it is entitled to some assurance that other Universal immunity holders will not be granted a three-eighths reduction from normal third-party rate by reason of their Universal immunities alone. Suggest you discuss with Ringer and cable us best that can be done for protection of oil company parties" (exhibit 180).

The following expressions used by Mr. Howard in a telephone conversation from Basle, Switzerland, to New York on May 1, 1940, emphasized the part that I. G. continued to play:

"Dr. Ringer stated that he was unable to consider the 20% leveled-off percentage from U. O. P. licensing. Since as a matter of principle it was essential that the I. G., for intermediate zone, receive a higher percentage even though in order to do so they had to sacrifice as regards the percentage to be received for catalytic refining * * * Mr. Howard stressed that this was absolute rock bottom and he was convinced that it would be impossible to secure Dr. Ringer's agreement on any lower basis * * *. Dr. Ringer's insistence * * * this was absolute rock bottom * * *. Dr. Ringer insists that no license be granted under a patent originating with the I. G. unless the I. G. receive back from the grantee the free right for the I. G. to operate in Germany under the grantee's patent rights * * *. Dr. Ringer would accept a provision whereby the oil company parties should pay five-eighths of the lowest rate applied to any class of licensee (as a class) * * *. He felt it essential, however, that it be possible to make special trades with individual companies in the light of some particular set of circumstances without affecting the royalty rates payable by the oil company parties" (exhibit 181).

On May 4, 1940, Mr. Howard cabled Mr. Russell from Basle, Switzerland, on the suggestion of the above royalty arrangement as follows: "Ringer adamant" (exhibit 182).

The result of the conferences were summarized in this cable as follows:

"Ringer has given me letter outlining conditions acceptance whole deal and containing several small troublesome points. On receipt telegram from him, confirming letter, we can regard matter finished here, subject only acceptance all parties New York of number relatively minor points in letter. Air mailing copy letter" (exhibit 183).

I. G. wrote to Standard, under date May 11, 1940, under the signature of two of its officers, setting forth a final statement of the terms upon which Standard should carry on with C. R. A. to complete arrangements to pool both the Standard and the I. G. patents. The letter contained a formal release of all obligation to exchange technical information with I. G. during the war. The letter set forth that—

"Standard will, before final execution of the contracts, obtain assurance from Shell that on the termination of the present war Shell will stand ready to join with Standard to proceed in accordance with a certain memorandum of August 15, 1939, entitled MEMORANDUM REGARDING SHELL AND JERSEY ROYALTY PAYMENTS, * * *" (exhibit 125, supra).

The right of Standard to proceed with C. R. A. was stated as follows:

"Standard I. G. or C. R. A. may grant licenses or immunities under the patent rights originating with I. G. with or without those originating with Standard and may fix the price and terms of such license, subject only to the agreement of November 9, 1929, and shall pay over to I. G. 20% of the proceeds."

Standard has complied with the terms of this letter agreement. We may note that I. G. specified in this agreement that C. R. A. should grant no catalytic refining license at a rate less than a minimum of 2½ cents per barrel. By letter of April 1, 1941, Mr. Howard reported to the executive committee that Indiana had developed an isoforming process which would not stand a royalty higher than 2 cents per barrel. He reported, however, as follows:

"Under our proposed C. R. A. agreements we have no right to license any process for less than 2½¢ without the consent of everybody concerned. In the proposed cable we are suggesting that I. G. give its consent to licensing this process at 2¢ per bbl." (exhibit 184).

Digitized by Google

The executive committee approved dispatch of the cable and I. G.'s consent was obtained (exhibit 185).

Along with the letter agreement of May 11, 1940, thus drawn to express the terms upon which Standard should carry on with C. R. A., Dr. Ringer forwarded a detailed 10-page outline of comments and suggested revision of the C. R. A. memorandum of April 13 (exhibit 186).

In a letter of May 14, 1940, from Mr. Loofbourow to Mr. Russell there appears an itemization of some of the "more important and troublesome requests made." One of these contained an essential bearing upon whether or not C. R. A. should be an exclusive or a nonexclusive arrangement. It appears that I. G. had insisted "that any party granting a license or immunity under its own patents alone for cash or its equivalent will withdraw from the exchange of technical data" (exhibit 187).

Mr. Howard cabled I. G. on this point on July 3, 1940, as follows:

"Counsel finally rejected your proviso in point four that party granting license under own rights for cash will withdraw from exchange experience" (exhibit 188).

These antitrust considerations entertained in opposition to I. G.'s demands were, however, given little practical effect under the draft of July 9, 1940. It did reserve for each party the right to grant licenses under its own patents and to retain royalties received. However, the parties were expressly forbidden the right to divulge information within the C. R. A. field to outsiders, except under narrow conditions and severe penalties. It was provided that oil company members should not give such information to outsiders unless compelled to do so for protection of their main operating interest. The evident meaning of this provision is that the parties should have the right in case they were forced to make such an arrangement with outsiders because of a patent conflict. The penalty was provided in case such member did make such an arrangement for exchange of information with an outsider that such member must withdraw from the group exchange of experience, but must nevertheless continue to furnish the group such party's own experience in the field. Therefore, in practice, all that the parties actually retained was a bare licensing right under their own patents, but without free opportunity to accompany the license with information for operation of the licensed process.

The above cable of July 3, 1940, contained the following appeal by Standard to I. G. to allow Standard to go ahead and make decisions itself in negotiating for the licensing of C. R. A. processes. I quote:

"On the whole we think agreement is still practically workable and satisfactory but we are increasingly concerned over the basic legal situation which causes counsel to insist upon deletion these various detailed provisions which we think are normal and desirable from a business standpoint STOP We therefore recommend you wave points Firstly and Secondly so far as their detailed effect is concerned and leave with us decision which must be taken next week to initial agreements at once and start technical cooperation or on general grounds more than with particular reference to above detailed points to further defer conclusion of matter" (exhibit 188).

We note the following memorandum by Mr. Howard dated July 10, 1940:

"I talked to Dr. Ringer in Berlin this morning and secured his full approval to the C. R. A. agreements in the form in which they were initialed by all parties and left with me yesterday. The agreements will therefore be released today and the cooperation of parties under the agreements will begin at once" (exhibit 189).

Whether Standard's wish to complete its acquisition of control after 1948 over patents I. G. should acquire after 1941 is the entire explanation of these continued efforts of Standard to obtain I. G.'s approval of final C. R. A. terms, and what urgency there existed during wartime to assure continued future control of I. G.'s future patents are obscure questions. It is at least clear, however, that during 1940 Standard was seeking to extend the 1929 four party agreement.

FLOW OF C. R. A. ROYALTIES FROM ENGLAND TO GERMANY DURING WAR

The technlogical power of the Standard-I. G. agreement and the forms in which it was reposed were capable of bringing about the flow of royalties from England to Germany during the war.

Mr. Russell of Standard, reported to Mr. Howard in a letter of August 20, 1940. as follows:

"Mr. Asbury, Mr. Loofbourow and I talked C. R. A. matters with Mr, Jackson and Mr. Smith of Anglo-Iranian, this morning and I believe satisfied them on all

Digitized by Google

points save one. We gathered the impression that Anglo Iranian would require assurance that any royalty payments made by them during the period of the war would not inure to the benefit of any German company or national" (exhibit 189–A).

A cable in Standard's files from Anglo-Iranian's London office to its New York office expressed this point emphatically as follows:

"You must insist that definite assurance is given that I. G. or S. I. G. are not included in any way in proposed agreement" (exhibit 189–B).

Mr. Howard write to Mr. Jackson, of Angla-Iranian, on August 22, 1940, the following account of Standard's acquisition of I. G.'s interest in S. I. G.:

"Mr. Russell has told me of his conversation with you concerning the C. R. A. payments. Under the proposed contract structure these payments will be made to a new company, identified as The Special Company, to be set up and owned 50% by Jersey and 50% by Shell. The royalties received by the new company from Anglo-Iranian as well as other licensees will be paid, according to the origin and nature of the royalty and pursuant to a rather complicated schedule, to one or more American corporations and to the Bataafsche Petroleum Maatschappij, of Curacao. The American corporations in question are in turn owned 100% by American interests with the exception of some holdings by Bataafsche. No payments are to be made by The Special Company to any German corporation or to any corporation in which any German national or corporation is a shareholder.

"We hope that these assurances will be satisfactory to you. The payment of hydrogenation royalties by I. C. I. to International Hydrogenation Patents Company gave rise to the same question, and these same assurances resulted in a permit, by the proper authorities, authorizing the payments.

"We realize that these assurances leave open the possibility that German interests may still receive indirectly through contracts or indirect shareholdings, certain benefits or moneys as a result of payments made to American owned American corporations. On the informal advice of our own Department of State to whom me submitted the question in connection with the I. C. I. payment, we cannot as a matter of principle undertake to give you any assurance so sweeping as to negative these possibilities. It seems to be well recognized that there are practical limits on the extent to which it is proper to attempt to follow the flow of payments or benefits through business channels" (exhibit 189–C).

In response to these representations, Mr. Jackson replied to Mr. Howard on August 23, 1940, as follows:

"I am much obliged for your letter of yesterday, and for your very clear and frank explanation of the position regarding royalties. As far as I am concerned, this information clears up the points on which I was doubtful, and I shall be glad to arrange for our technical data to be exchanged and for Mr. Smith to attend the forthcoming meetings" (exhibit 189–D).

Every statement Mr. Howard made in his letter is true. He has even gone beyond literal statements of fact and raised the possibility of a German interest existing by contract with American corporations. Yet all of the statements as to stock ownership and as to the immediate recipients of the payments are quite beside the point. Since 1929 the substantial interests in S.–I. G., that is, Standard Catalytic Co., have been governed not by stock ownership but by overriding contract. The ultimate recipients of the payments, Standard and I. G., themselves arranged by contract the corporate intermediaries to receive payments. The jointly held corporation has been a mere form for carrying out the partnership. After all the formal rearrangements made by Standard and I. G. after outbreak of the war in Europe, the fact remained that I. G.'s interest in royalties was just about exactly what it was before the formal changes.

On a fair judgment of this transaction it is doubtless true that Mr. Howard did not have an intent to deceive. It is suggested by the record that Anglo-Iranian was anxious to be given a formula upon which it could proceed. Mr. Howard's letter certainly had the character of a formula, and apparently it was adequate.

Anglo-Iranian was under the practical necessity to come to the United States to enjoy the exchange of patent rights and technical information set up by C. R. A. The United States was neutral, its corporations had the right to make contracts with German corporations, and they had the right to agree to pay to German corporations royalties in amounts corresponding to royalties received from English companies. They had a right to refrain from disclosing these obligations to English companies. Nevertheless, the fact remains that the British Government sought to prevent payment by its nationals to German nationals

Digitized by Google

during the war, and yet, in actual result, that is exactly what was to take place under the C. R. A. arrangement.

GERMAN GOVERNMENT CONTROL OF THE TERMS OF AMERICAN PATENT POOLS

It is, of course, notorious that for the last several years German business enterprise has been German Government enterprise. But it certainly should be expressedly pointed out that this agreement upon C. R. A. processes, which was international in character and which lay down the lines all over the world for enjoyment and licensing of modern catalytic processes, fixing economic advantage and prerogative therein, was promoted from the beginning under the control and direction of the German Government. We see the hand of the German Government in the following cable dealing with approval of the original London agreement of October 12 and 13, 1938, sent by Ringer to Howard on November 10 of that year. I quote:

"I. G. has approved in principle of catalytic refining deal provided Government approval will be obtained" (exhibit 190).

The like control as to the terms of the hydrocarbon synthesis patent pool has already been observed.

It is, of course, not to be argued that whatever Germany does the United States should do. Obviously, if German authorities imprison citizens without cause, that is no recommendation for similar action here, but the contrary. But in agreements of this character, the subject matter is of enormous public and international importance. It is clearly an unwholesome situation that a foreign and, since 1933, a notoriously dangerous government should have a guiding hand in the creation of such international and domestic arrangements, while the Government of this country did not even know the terms of the arrangements under negotiation—and, indeed, was not informed of the terms of the underlying basic relations that had existed since 1929 between the two principals, who were the largest industrial corporations in Germany and the United States, respectively.

It is intolerable that not alone the international arrangements for such a subject matter as C. R. A. but even operations within our own country have been forced to wait the approval of the Hitler government. In 1939 the Standard Oil Co. of California had at length worked out a tentatively satisfactory arrangement for a C. R. A. license. It was signed and submitted to I. G. A letter of May 1, 1939, by Mr. Howard to California states the following:

"Dr. Ringer, of the I. G., has been with us for some days now, and advises that the California agreement has been accepted * * * by his Board, and informally approved by the Government. He is not able to release the contract, however, until the formal, written approval of his Government is received" (exhibit 191, and see exhibit 192).

One piece of the machinery by which the German Government obtains minute control over the patent arrangements of its own companies is that a German company cannot obtain Government approval for any patent agreement with others under which it must pay foreign exchange in royalties unless it can show an "absolute necessity for the payment of royalties." We see this condition stated in a letter by I. G.'s Bütefisch to Mr. Howard dated May 10, 1938, in which Mr. Bütefisch points out that I. G. would not be permitted to pay royalties to Universal or Gasoline Products for licenses under their German cracking patents, since I. G. already had patent rights for equivalent processes (exhibit 193). Unquestionably German governmenttal restrictions frequently, if not usually, operated to confer bargaining advantages on the German companies in their dealing with foreign companies. In contrast, we observe that under the C. R. A. memoranda the parties, even the members, were required to pay royalties to I. G. by definition, that is, for operations of the character defined in the agreements, even if, for whatever reason, they did not in fact need a license under any I. G. patents.

CONCLUSIONS RE C. R. A.

In C. R. A. Standard sought to create by force of agreements with the leading oil companies a self-perpetuating patent position covering generally the entire field of modern catalytic refining for production of gasoline and other petroleum products, affording a free right to the member companies to use the present and future patents, discoveries, and technical information of others, and giving Standard a fixed royalty advantage in the field thus defined.

Digitized by Google

The group was to be tied together by commitments to exchange technical information exclusively within the group and among its licensees. The pool was broader than any patents of any one party and even than patents of all the parties. The original parties were taken in as members of the pool regardless that they had no considerable patents in the field and simply because of, and with participating shares based upon, their size, their research and technical potentialities, and their positions under existing agreements.

Standard was able to exert great pressure in forming the pool and in gaining its predominant position by its existing contract giving it control of all of I. G.'s oil refining processes. If Standard's real purpose in C. R. A. was only to promote common research for the discovery of new processes, and to provide by the agreement merely a means for licensing the new processes to the public while protecting the interests of the parties in their disclosures and in the resulting discoveries, Standard could have dropped I. G. from the negotiations when the outbreak of war prevented I. G.'s participation in or contribution to the C. R. A. joint research. Negotiations with I. G. could have been postponed until a time when I. G. could contribute. But Standard sought persistently to tie up the I. G. patents and research of the future. For this purpose Standard sought by every means to effect a final agreement with I. G. and referred every stage of the C. R. A. negotiations to I. G. for its consent. This is one view of the nature of Standard's negotiations. The other is that Standard already regarded itself as fully committed to act at all times as a full partner of I. G. in the C. R. A. field, committed either by its express undertakings with I. G. in that field since 1938, or by its general partnership. The practical result of either view is the same—that for years Standard and I. G. lived together in joint exploitation of this field. Standard committed itself to the C. R. A. partners to bring in the future I. G. patents. If it did not live up to this commitment, it would lose its predominant position for free use of the patents of others and the right to royalties from others. The common research would go on equally as well, but the patent advantage to be given Standard by the agreement would be lost. Standard's promotion of C. R. A. as a means of securing and crystallizing fixed patent advantage to it in this field was thus demonstrated.

Standard also utilized for these purposes the hydrogenation contracts to which all the major oil companies in this country were parties and which served as a potential dragnet to take control of many aspects of the new processes if they should not be surrendered into the new C. R. A. pool. Standard was also able to exert great pressure upon Shell because of its affiliation with it in hydrogenation abroad. After the joinder of Shell in the C. R. A. pool the power of the group was again greatly enhanced. The record is clear that Standard in fact exerted pressure from all these sources to the utmost.

As in the other pools promoted by Standard, the old hydrocarbon field definition formulated in Standard's basic agreement with I. G. was brought into C. R. A. This joint endeavor by the oil industry was thus to be kept out of the chemical industry. Standard faithfully performed its commitments to I. G. under which it enjoyed the control of I. G.'s oil processes.

Whereas a successful independent development, the Houdry process, was the immediate occasion for promotion of C. R. A., a successful independent development was thus a stimulus to large company combination, the terms of which would thereafter present an obstacle to independent development.

It is beside the point if this country was better off with C. R. A. than without it, when the real question is whether C. R. A. was not far worse than it need have been had it not been shaped to serve an overacquisitive and oppressive policy. Under the mantle of the C. R. A. understandings there was indeed helpful exchange of technical experience and information, and combined patents and methods were to be made available to the industry. Of course the work of many can exceed that of one, and that of many together exceeds that of many apart. Of course one license under many patents may in many cases be necessary for satisfactory operation. But it is basically unfair when one company, first by its size, then by its own size augmented by complete joinder with its supposed peer in modern research; namely, I. G. Farbenindustrie, and finally by the power of agreements into which it can attract or beguile the leaders of the industry, is able to compel cooperation on its terms which fix for it a preferred position not only under methods of manufacture now known but also under those of the future and unknown. It is certainly not good for the country that the terms so offered should minimize incentive for development, as do the

Digitized by Google

C. R. A. terms under which the group demanded free right to all catalytic refining developments or innovations, however substantial, by licensees, and under which only the group should receive royalties in the field, regardless of developments.

THE CONSENT DECREE

In these circumstances, the remedy as to C. R. A. provided by the consent decree entered in the Standard Oil case was that C. R. A. was abolished. The parties are of course perfectly free to license their own patents and to make a joinder licensing arrangement on a different principle, avoiding the invidiously exclusive features of C. R. A. and the freezing of advantage and disadvantage over future developments. Of course, the decree permits any arrangement sanctioned by a war agency of the United States Government.

The root of C. R. A. was cut by a declaration of invalidity of the hydrogenation plan, by severance of Standard's relations with I. G., and by making available free of use restrictions or other limitations, royalty free to the public, the patents pooled between Standard and I. G. Hydroforming is subjected to the compulsory licensing provisions by name, regardless of any consideration as to its status or as to the extent to which it was pooled with I. G. Thus in this field Standard's own patents as well as those originating with I. G. are thrown open under the compulsory licensing provisions. In addition, the decree contains the general provision that all patents held by Standard, its subsidiaries or representatives, as to which either Standard or I. G. assumed any commitment to each other, are made subject to compulsory licensing provisions.

EXHIBIT 140

METHANOL OR METHYL ALCOHOL (STANDARD OIL OF NEW JERSEY AND I. G. FARBEN)

Statement by John R. Jacobs, Jr.

BACKGROUND

This committee is familiar with the basic arrangements between Standard Oil Co. of New Jersey and I. G. Farbenindustrie, entered into on November 9, 1929. Standard was in the alcohol business prior to the execution of these agreements, and its alcohol business should not have been affected by the agreements with I. G. This had been made clear at a meeting between I. G. and Standard officials on March 21, 1929:

"Mr. HOWARD pointed out that we were already interested in chemical and pharmaceutical specialities, such as NUJOL and FLIT, on the one hand, and solvents, on the other hand, and that we have carried out extensive research and development work in the solvent field.

"Dr. BOSCH *stated that he had reference not to our present activities but to future developments.* He explained their agreement with the Winthrop Chemical Co., which is to sell I. G. products. With regard to solvents, he stated that I. G. were very much interested and would like to come together with us. He stated that he desired to prevent our competition in colors, pharmaceuticals, etc., with particular reference to new products, and explained in confidence certain developments which they had already undertaken. In the matter of these new developments, he wished the management and dominant interest to be in the hands of the I. G. He stated that it was the policy of the I. G. not to go into old fields already occupied but to create new industries and new fields; that the I. G. did not wish to go into competition in the U. S. with the U. S. chemical industry" (exhibit 1).

However, in spite of the fact that I. G. stated it was not interested in Standard's "present activities," Standard's relationship with I. G. did effect the production of methanol in the United States and also adversely affected the Standard Alcohol Co., a corporation in which Standard held a majority interest.

On September 26, 1919, Standard entered into a contract with the Melco Chemical Co., whereby Standard took over a number of alcohol patents. A small experimental plant was constructed in 1919–20 at the Bayway refinery, and with the development of the business, additions were made to the plant from time to time until 1930. Unfortunately, from a business standpoint, the

Digitized by Google

largest additions to the plant were made in 1929–30, at a time when costs were at their peak. Prior to 1930 the operations in some years were profitable and in other years unprofitable, but the net loss for the entire period beginning 1919 and ending 1929, after paying royalties amounting to some $326,000, was about $57,000. From approximately 1930 to 1934, inclusive, during which time the Standard Alcohol Co. was formed, the operations showed substantial losses. This was primarily due to the fact that the volume of business was not sufficient to absorb the financial burden of the greatly enlarged plant (exhibit 2).

The Standard Alcohol Co. came into existence and began operations on October 1, 1932, as the result of patent litigation between Standard and the Petroleum Chemical Corporation, which corporation was controlled by the National Distillers Products Corporation. Standard Alcohol Co. is now owned 65 percent by Standard and 35 percent by National Distillers Products Corporation.

The Standard Alcohol Co. was under a handicap from the outset because, as previously mentioned, "for policy reasons" (as stated by Standard) it was obligated to purchase the alcohol inventory of the Standard Oil Co. of New Jersey on October 1, 1932, at a cost of $917,178.51, which cost was $257,191.61 higher than the cost of replacement at that time. This high inventory cost obviously had an adverse effect on the future earnings of the company.

The principal products manufactured and sold by the Standard Alcohol Co. are industrial isopropyl alcohols (when blended with methanol or wood alcohol, is used as an antifreeze), Deenax (a denatured grade of isopropyl alcohol) higher alcohols and acetates (used in the lacquer and furniture industries), and various other miscellaneous products.

METHANOL AS A MOTOR FUEL

It will be recalled that in the four-party agreement between Standard and I. G. of November 9, 1929, the hydrocarbon field was defined as the treatment of carbonaceous liquids, solids, and gases to produce marketable major products which were commonly produced in the oil and natural gas industries. In the hydro patents and international hydro patents agreements, by which the processes pooled in the S. I. G. Co. were exploited, both in the United States and the world outside of Germany, the term "hydrocarbon field" was limited to the treatment of only liquids and solids. Therefore, the treatment of gases was transferred to the S. I. G. Co. by Standard and I. G., but this right was not transferred to companies who obtained their rights from S. I. G. As stated by I. G. in a letter to Mr. Howard of February 12, 1932:

"The production of methanol from carbon oxides and hydrogen comes partly under the four party agreement and more particularly under hydrogenation and still more particularly under the hydrogenation of gaseous products which is not included in the Hydro Patents and I. H. P. contracts, but has remained in the hands of S. I. G." (exhibit 3).

A memorandum prepared by I. G., dated May 24, 1932, states:

"Up to the present time methanol is exclusively used in the chemical field, but its possible use as a motor fuel is now being widely discussed. Several requests have reached the I. G. asking for a license on the rights and experiences of I. G. for producing methanol. It is obvious that these requests have been prompted by the interest that methanol is now raising as a possible motor fuel.

"We have talked the situation over with Mr. Howard and came to the conclusion that this is a situation where I. G. and the Oil Companies are dependent upon each other; it would seem practically impossible that the licensee manufactures 2 kinds of methanol, one under our patents or with our technical experiences and the other without it. Therefore I. G. and I. H. P. should proceed in accordance with each other and should first agree on a general line of policy to be pursued; such general line would seem to be not to push the licensing of the process but not to refrain from granting licenses in cases where people would otherwise go ahead themselves; * * *" (exhibit 4).

Further, in regard to the use of methanol as a motor fuel, von Knieriem, of I. G., said in a cable to Mr. Howard, dated April 25, 1932:

"For Howard. With regard to general licensing policy Methanol we agreed with you in Ludwigshafen that there should be no pushing but that it would be useless to deny cooperation in cases where people would otherwise go ahead themselves * * *" (exhibit 5).

From the above it is obvious that Standard and I. G. have not actively promoted the use of methanol as a motor fuel.

Digitized by Google

METHANOL IN THE CHEMICAL FIELD

The methanol patents of both Standard and I. G., when the product produced was to be used in the chemical field, e. g., as an antifreeze, were not included within the division of fields agreement or Jasco, the corporation formed by Standard and I. G. to exploit chemical developments, because it was not "any new chemical development," as defined by the parties. Therefore, the use of methanol in the chemical field was left for future negotiations by Standard and I. G. when the basic agreements were executed in 1929.

Before taking up the negotiations between Standard and I. G. in regard to the use of methanol in the chemical field, it is considered advisable to quote a letter of June 4, 1940, found in the Chemnyco files, in reference to the significance of methanol as an antifreeze product for automobiles:

"Of the 30 million cars at present used in the United States, about 25 million use antifreeze products. Each car needs an average of two gallons per year. The entire market for antifreeze products here amounts to 50 to 55 million gallons a year, of which 9 to 10 million consist of Aethylenglycol—which no longer is an exclusive product of the Carbide and Carbon Chemical Corporation (Preston)—the remaining amount is divided among glycerine, denatured and pure ethyl alcohol and Methanol (synthetic and wood-coal Methanol) and Methanol mixtures. Methanol and Methanol mixtures cover more than half of the entire demand.

"Aethylenglycol has been sold here for $2.65 per gallon during the past winter. Aethyl alcohol, Methanol, and Methanol mixtures have been sold at $1.00 a gallon. From an economic point of view, Methanol is mostly preferred; if it is compared with Aethyl alcohol it gives 20 percent more protection to the car provided the same volume is used. The objection that Methanol is more easily transformed into steam is correct, but it is without any practical significance since under normal conditions the steaming process is so small that it is not necessary to add more Methanol during the winter, especially since Methanol gives more protection from the very beginning."

* * * * * * *

"In regard to future developments, the prevailing opinion is that the Methanol antifreeze products will be preferred to the more expensive Aethylenglycol products, since an increasing number of people are anxious to keep the expenses for driving a car as low as possible. It is to be noted that the demand for Aethylenglycol antifreeze products has decreased since the C. C. C. C. is able to entirely meet the demand. The fact that the need for Aethylenglycol could not be met in previous years obviously increased the demand. Furthermore, the great profit favorably affected the sale of Aethylenglycol, which profit has been made by the companies which distribute Aethylenglycol. We are told, for instance, that the Aethylenglycol of the C. C. C. C., which is sold to the retail trade at $2.65 per gallon, is delivered to the jobber at $1.32.

"The use of antifreeze products seems to have been increased beyond the practical necessity by the very impressive sales propaganda. In this connection, it is interesting to know that the New York taxi drivers, who earn their living from driving their cars and who have to exercise the greatest economy, use only two quarts per car and not two gallons per car. Through experience they have found that this quantity is absolutely sufficient to prevent continuous freezing, and that a light snowfall does not do any harm to their machines" (exhibit 6).

STANDARD, I. G., AND DU PONT NEGOTIATIONS RE METHANOL

In 1934, Standard, through the Standard Alcohol Co., was interested in the production of ethyl (or grain) alcohol, and it was concerned because of the fact that du Pont was also interested in the production of ethyl alcohol. On October 12, 1934, Mr. Howard wrote to Standard's coordination committee that:

"I advised the du Pont Company nearly two years ago, when the question of greatly expanding the lead market by its use in nonpremium fuel was under consideration, that the Standard Oil Company of New Jersey were potential producers of ethyl alcohol, and that if we continued to permit the du Pont Company to have a monopoly on the manufacture of tetraethyl lead, we would consider that we were justly entitled to the alcohol supply business, when and if we became producers" (exhibit 7).

He continued by recommending a full discussion of this subject with du Pont before anything further was done in regard to synthetic alcohol production.

Digitized by Google

Nothing further was done until January 6, 1936, when Mr. Bedford, an executive of Standard, wrote to Mr. Teagle that the alcohol problem had reached such a stage that "we must either fish or cut bait" (exhibit 8), and therefore the future policy of the company should be worked out at this time. Mr. Howard was sent a copy of this letter, and he replied to Mr. Bedford on February 4, 1936, and said that the "following specific points require clarification before any ultimate decision can be made: (1) The views of our I. G. friends on the subject of our producing Methanol in the United States and the cost and prospective profits of this venture. (1) * * *. (3) The result of any discussions with the du Pont company along the line which Mr. Teagle has instructed me to follow in connection with the development of the ethyl lead and raw materials business at Baytown" (exhibit 9).

On April 27, 1936, Mr. Howard wrote to Mr. Teagle that in view of the necessity of moving as quickly as possible in regard to the ethyl matter "it also becomes desirable to move as fast as we can with our parallel discussions with the du Pont Company." Mr. Howard continues:

"It was specifically agreed between myself and Dr. von Knieriem of the I. G.'s consenting to license us and give us their experience for this Methanol alcohol production, we would clear the matter with du Pont Company in some proper way, making it clear to them that nothing inimical to their interests in the chemical business was intended by this new venture of our own entered upon with the assistance of the I. G. It is quite certain that out of any discussion * * * there will arise the general question of the place and ambition of the Standard Oil Company in the chemical field. *It is my proposal that I should not take any definite position at all in this matter except to assure Mr. Crane (du Pont) that fundamentally our purposes is to work in cooperation with the du Pont Company and to avoid, if at all possible any direct conflict with their commercial interests in the chemical field*" (exhibit 10).

On July 10, 1936, Mr. Howard wrote to Mr. Fisher of Standard, that the Standard Alcohol Co. purchased approximately one-and-a-half million gallons per annum of methanol, which was required in its antifreeze business and—

"The I. G. are willing to license us under their synthetic Methanol process to produce this material; they make it a condition of the license that we should advise du Pont what we are proposing to do in order to avoid, if possible, any difficulties with them. Du Pont suggested that we name it a figure at which we would be willing to purchase our supplies from them rather than engage in manufacturing ourselves" (exhibit 11).

Mr. Howard ended his letter by saying that he was glad that they did not have to make an immediate decision on this question, because it involved not only supplies for the antifreeze business, but also the question of much larger supplies from du Pont for other chemical purposes.

In the middle of 1936 a study was made by Standard to determine whether or not it would be desirable to install methanol producing facilities at Baton Rouge to supply all of the company's requirements for its antifreeze business. At a meeting held in August 1936 of Standard's chemical committee, composed of F. W. Abrams, F. H. Bedford, Jr., R. W. Gallagher, R. T. Haslam, H. C. Weiss, and H. W. Fisher (which will hereinafter be referred to as the chemical committee), it was decided to obtain the views of Mr. Howard, who was in Germany at that time. Mr. Howard was still interested in approaching du Pont before any decision was to be made. By cables on August 10 and 11, 1936, Howard suggested that the chemical committee develop "with du Pont the price to which du Pont would be willing to supply us with Methanol."

Mr. Howard suggested that no definite offer be made "du Pont at this time, and that in discussing prices, it be made plain to them that we cannot yet tell whether the prices given would be satisfactory."

Mr. Howard also advised the chemical committee how the Robinson-Patman Act could be circumvented in the event du Pont contended the Patman Act prevented them from quoting to Standard a lower price for methanol than other purchasers.

"* * * if du Pont feels unable to quote low prices because of the Patman law, separate purchase agreements might be made with the Alcohol Company under which du Pont could take from the Alcohol Company sufficient quantities of products at satisfactory prices to bring about the desired results" (exhibit 12).

Of course, Mr. Howard was insisting that the chemical committee designate some representative to discuss the alcohol project with du Pont before any active policy was formulated, because I. G. was making it a condition to the granting of a license to use its process. On August 14, 1936, Dr. Hopkins wrote

Digitized by Google

to Mr. Bedford that it was very urgent that methanol be produced at Baton Rouge by the I. G. process. He stated, however, that "the first step is to meet the I. G. request that du Pont agree to our using the I. G. Methanol process. It is my understanding that du Pont has expressed a willingness to agree, providing we name them a price at which we would buy from them in preference to manufacturing" (exhibit 13).

Dr. Hopkins ended his letter by suggesting that Mr. Russell be authorized to develop with du Pont the price at which they would be willing to furnish methanol, and also that "Standard should not be limited to the antifreeze market in selling methanol."

The chemical committee followed Dr. Hopkins' suggestion and on August 31, 1936, Mr. Fisher wrote to Mr. Bedford, with copies sent to all members of the chemical committee, that he and Mr. Russell "in accordance with permission granted by the Chemical Committee" had approached the du Pont Co. on "the alternative of either manufacturing Methanol ourselves or obtaining it from them at a price comparable to our estimated cost" (exhibit 14).

On August 21, 1936, Mr. Howard wrote a letter from London to the attention of Messrs. Russell, Currie, and Fisher, stating:

"We have the following problems to meet: We are in immediate need of licenses, experience, and help from the I. G. on the following subjects: (*a*) production of Methanol, (*b*) production of ethyl chloride. The methyl alcohol is needed primarily by the Standard Alcohol Company for its own business.

"The I. G. have immediate need from us for licenses and technique for the production of isopropyl ethers for aviation gasoline. They also desire to have available to them for future use licenses and technique for the production of ethyl and higher alcohols from olefins" (exhibit 15).

Howard then outlined his ideas as to how the whole matter should be handled and stated the desire that he wanted the approval of the chemical committee to his proposal by August 31, "since I expect to be again in Germany during the following week."

Before receiving an answer to his letter of August 21, Mr. Howard cabled Russell on August 24, 1936, that he wished presented to the chemical committee within the next week a proposal which he had developed with I. G. "as a possible method of meeting mutual problems and is now being considered by the organization."

This proposition was that Standard Alcohol and Standard Oil Development Co. grant to I. G. an exclusive royalty free license for Germany on all patents relating to the use of isopropyl ethers in gasoline and production of methyl alcohol, etc., in return for which I. G. "will grant to the Standard Alcohol Company and the Standard Oil Development Company an exclusive royalty free license for the United States for the same field as above."

He stated that if the proposal outlined in his cable were approved in principle, "I believe detailed contracts acceptable by all parties will result * * *" (exhibit 16).

The chemical committee had several meetings to consider Howard's suggestions. The committee cabled Mr. Howard on September 10 and pointed out changes that would have to be made in the contract between the Standard Alcohol Co. and the Standard Oil Development Co. dated October 1, 1932, in order to have a "suitable basis for negotiations with the I. G."

Mr. Howard disregarded practically everyone of the chemical committee's suggestions in drafting an alcohol agreement with I. G.

I. G.-STANDARD ALCOHOL CO. AGREEMENT

A conference was held at Baden-Baden on September 9, 1936, attended by Dr. Ringer and Dr. Holdmann of I. G., and Mr. Howard, Mr. W. R. Carlisle, and Mr. W. C. Asbury of Standard (exhibit 17). At this conference the I. G. members felt that the use of the methanol process by the Standard Alcohol Co. would have to be limited to the antifreeze field, as the I. G. had some market for methyl chloride in the United States at that time. A full discussion was had on the whole alcohol problem and a general proposal was drawn up.

Mr. Howard reported on his negotiations to the chemical committee, and Mr. Fisher wired Mr. Howard on September 24, 1936, that he, Russell, and Currie "believe proposed agreement satisfactory except for restrictions on Methanol (stop) now using Methanol as constituent of mixed solvent formulas and desire freedom use Methanol as raw material for methyl chloride and other possible derivatives" (exhibit 18).

Digitized by Google

Another wire was sent by Fisher to Howard on September 25, in which he stated that the chemical committee "agree alcohol deal except limitations on uses alcohol should preferably be only those on which I. G. committed itself to others because Standard Alcohol now has wide variety uses for Methanol" (exhibit 19).

Howard disregarded the suggestion of the chemical committee and wired Fisher on September 28, 1936, that he had completed the agreement in principle on the general basis decided upon at Baden-Baden. This information was presented to the chemical committee by Mr. Fisher on October 20, 1936, along with a copy of the agreement (exhibit 20).

Because of the importance of this agreement and the many restrictions it contains in regard to the use of the licenses granted, it is thought better to quote verbatim the most important provisions:

"ALCOHOL—ALKYL CHLORIDE

"*Agreement in principle*

"Standard Alcohol grants to I. G. for Germany and I. G. grants to Standard Alcohol for U. S. A. royalty-free exclusive transferable licenses for all processes for the manufacture of: (*a*) ethyl to hexyl monovalent alcohols from olefines, (*b*) the corresponding ethers from the olefines directly or from alcohols made from the olefines.

"(2) The exclusive license granted by Standard Alcohol to I. G. for Germany shall be subject to the right of Standard to use its own inventions royalty-free for its own oil business in Germany and to license Shell to use said invention for Shell's own oil business in Germany, and the exclusive license granted by I. G. to Standard Alcohol for U. S. A. shall be subject to the right of I. G. to use its own invention royalty-free for its own chemical business in U. S. A.

"(3) Above grants do not include any inventions for the use of the products in question or for new compositions including them, but Standard Alcohol will also grant to Development the right to pass to I. G. under the Four-Party Agreement all its inventions relating to above products and their use insofar as the same are under the hydrocarbon field so that as to such products I. G. has the same right as though the inventions of Standard Alcohol belonged to Development.

"(4) I. G. grants to Standard Alcohol for the U. S. A. and Standard Alcohol grants to I. G. for Germany royalty-free nonexclusive nontransferable licenses for all processes for the manufacture of ethyl nonchlorides from alcohol or ethylene for use in the manufacture of alkyl lead compounds only.

"(5) Both parties agree in principle to grant each other nonexclusive nontransferable licenses for any processes for the manufacture of ethyl-monochloride for use in the manufacture of ethyl lead using as a starting material other products than alcohol or ethylene and any process for the manufacture of methyl or propyl monochloride for use in the manufacture of alkyl lead compounds only. These licenses, however, shall not be royalty-free, the royalty basis for any of such processes shall be 25% of the improvement in manufacturing costs over the processes otherwise available to the party, provided such costs can be accurately determined, otherwise the royalty shall be fixed by agreement as nearly in accord with this principle as is practicable.

"(6) I. G. grants to Standard Oil Development for the U. S. A. and Standard Oil Development grants to I. G. for Germany a royalty-free nonexclusive nontransferable license for the manufacture of Methanol for antifreeze and for use for the production of methyl-chloride for manufacture of alkyl lead compounds only."

* * * * * * *

Later correspondence clarifies the intention of the parties in reference to this agreement. On December 26, 1939, Mr. Mueller of Chemnyco wrote to Mr. Howard that in reference to article 6 of the agreement:

"There can be no doubt that the parties to the agreement are not allowed to export Methanol, produced under the license in question, from the United States and Germany, respectively, to countries where the other party owns corresponding patent rights, and the respective patent laws prohibit the importing of a product manufactured under a patented process. With respect to imports into countries, however, where these two provisions do not apply, Article 6 seems not entirely clear to us and we would, therefore, appreciate your letting us know whether you concur in I. G.'s opinion that Article 6 is to be interpreted that the

Digitized by Google

Methanol produced under this license can only be sold in the United States and Germany, respectively" (exhibit 21).

Mr. Mueller also pointed out that I. G. agreed that although in the license agreement of September 1936—

"* * * The use of the Methanol manufactured under the license is restricted to the antifreeze field and to the production of ethyl chloride and manufacture of alkyl lead compounds, you may sell certain surplus quantities for other uses; payment of a royalty to I. G. being contemplated for such sales. As far as we recall, the question as to whether or not the sale of these surplus quantities should be restricted to a certain territory has never been discussed. In view of I. G.'s desire, as expressed above, we ask you to kindly agree that such surplus quantities are to be sold only within the United States" (exhibit 21, supra).

On December 29, 1939, Mr. Howard answered Dr. Mueller's letter and said that:

"I agree that it was the intention of the parties that the licenses granted under Article 6 should not carry with them any rights to export the material involved as such, and I agree that the same limitation applies to the surplus quantities to be manufactured by us in the United States under an agreed royalty. In all cases, however, I have also assumed that there would be no restriction at all on the export of products produced from the Methanol produced under the licenses" (exhibit 22).

Dr. Mueller replied to this letter on May 9, 1940, and said that he had taken the matter up with I. G. and that he had been informed—

"* * * that they have no objection to the exports of products produced from the surplus quantities of Methanol manufactured by your company in the United States under an agreed royalty, and that the same applies to antifreeze containing Methanol, provided the antifreeze cannot economically be used as starting material in the production of Methanol. With regard to methyl chloride produced from Methanol for the manufacture of alkyl lead compounds, I. G. states that, in granting a license under their respective patent rights to your company, it was not their idea that this license should include the permission to ship the methyl chloride out of the United States and work it into alkyl lead compounds abroad. I. G. would appreciate it if you would agree to it" (exhibit 23).

On June 7, 1940, Mr. Mueller of Chemnyco wrote to I. G. that "the following is agreed upon in regard to the exporting of Methanol and such Methanol products which are to be used in further manufacturing processes:

"1. Methanol as such is not to be exported by Standard.

"2. Products which are to be used for further manufacturing processes and which are manufactured by adding Methanol, for which Standard pays a special license fee, may be exported.

"3. Antifreeze products which are manufactured from such Methanol for which no license has to be paid may be exported, unless the antifreeze products shall be used as basic material for the manufacture of Methanol in the country to which it will be exported.

"4. Methyl Chloride manufactured from Methanol is not to be exported for the purpose of transforming it into lead alkyl compounds abroad" (exhibit 24).

The committee has probably already noticed that du Pont is not mentioned in the agreement. The correspondence also clears up this apparent oversight.

On October 6, 1936, I. G. wrote to Mr. Carlisle that the memorandum prepared in Berlin in September had been approved by I. G., but pointed out:

"As a matter of record we would like to mention that with regard to the license for Methanol for antifreeze (paragraph 6 of the Berlin memorandum), we were asked whether the reservation our people had to make with regard to du Pont was understood between you and us, although it is not specifically mentioned in the paragraph referred to. We have no doubt whatsoever that this is the case, and are mentioning this point only for the sake of good order" (exhibit 25).

This letter was forwarded to Mr. Howard on October 12, 1936, and as to the question raised by I. G. regarding du Pont, it was stated that he had assured I. G. "that the reservation regarding du Pont is understood by you" (exhibit 26).

On November 16, 1936, Mr. Howard cabled Mr. Carlisle in regard to further details on Methanol:

"This may refer to one of two matters: (1) Definite confirmation by us of acceptance agreement arrived at and brought back by me (stop) you are author-

Digitized by Google

ized to transmit this (2) additional information or understanding that we would not build Methanol plant without first discussing matter with du Ponts (stop) we have made contract with du Pont for one year's supplies beginning next summer and are at the same time discussing with them our estimated investment and operating costs, with understanding that if they are willing to give us supplies at price level not showing satisfactory return on our investment we will take from them (stop) they seem entirely satisfied with our position" (exhibit 27).

SUMMARY OF THE AGREEMENT IN PRINCIPLE

The most important points in the "Agreement in Principle" of September 1936, may be summarized briefly as follows:

(1) The National Distillers Products Corporation, which held a 35 percent interest in the Standard Alcohol Co., were not either invited to take part in nor consulted about, any of the discussions between Howard and the I. G. In fact, Messrs. Russell, Murphree, and Fisher were afraid the "scheme might result in bringing the company (National Distillers Products Corporation) with large minority interests into a field of major potential profit possibilities" (exhibit 28). Mr. Howard replied (cable of August 31, 1936) that this was a secondary matter to be decided between the two companies (Standard and National Distillers Products Corporation) after the major agreement between I. G. and Standard was disposed of. He concludes with: *"Specifically I propose to change the entire method of handling alcohol company business, and by agreement every one concerned (agrees this) converts it virtually into a development of our company with minorities regarding themselves only as investors"* (exhibit 29).

(2) The agreement supplemented and in no way conflicted with the four party agreement of November 9, 1929 (exhibit 30). Article 2 reserves to I. G. the use of its own inventions for its own chemical business in the United States. Article 3 requires that Standard Alcohol grant to Standard "the right to pass to I. G. under the four-party agreement all its inventions, etc."

(3) The agreement limits Standard's use of methanol to the antifreeze market alone.

(4) Article 6 restricts Standard from exporting methanol and limits its sale of the product to the United States, and conversely, I. G. cannot export methanol from Germany and is limited to sale within Germany. (This is not stated specifically in the agreement, but is brought out clearly in the correspondence quoted, supra.)

(5) Subsequent exchange of telegrams between the parties show that it was understood by Standard that as one of the conditions to the agreement arrived at in September 1936, was that before Standard would construct any plant to operate under I. G.'s methanol license, it would approach du Pont and explain to them its intentions, with the understanding that if du Pont were willing to supply methanol to Standard at a satisfactory price, Standard would purchase all its supplies from du Pont.

SUBSEQUENT NEGOTIATIONS

Mr. Fisher was not at all satisfied with the provision in the agreement that Standard could use methanol only in the production of antifreeze. He wrote to Mr. Howard on January 13, 1937:

"You have previously indicated that, with further negotiation, the I. G. might be willing to remove this restriction. May I suggest that you develop this possibility with the I. G. on your next visit if possible" (exhibit 31).

During the middle of 1938, Standard was considering the possibility of Jersey making use of its gas supplies and making the best advantage of its alcohol processes and patents. A meeting was held by the chemical committee on July 15, 1938, to study the "utilization of Jersey's surplus hydrocarbon gases and chemical manufacturing (exhibit 32).

Mr. Murphree, in a letter of July 25, 1938, to Mr. Fisher and Dr. Hopkins, emphasized one of the main restrictions contained in the September agreement with I. G.; he says:

"In the case of the Methanol operation, there will be 1,500,000 gallons of Methanol to dispose of on the open market. Our agreement with I. G. does not allow us to market Methanol, and some further arrangement will have to be made with them before this will be feasible" (exhibit 33).

Digitized by Google

Because of Murphree's letter, Dr. Hopkins wired Carlisle in London on August 31 that it would be helpful to obtain, if possible, I. G.'s consent to marketing Methanol outside the antifreeze field.

All during the year 1938, Standard had conferences off and on with du Pont in regard to furnishing Standard with methanol. Of course, Standard was holding a club over du Pont's head, in that if du Pont did not furnish them with methanol at a price which Standard considered to its advantage, then Standard would construct a methanol plant, using the I. G. process.

As a result of these negotiations, there was executed on December 29, 1938, an agreement between Standard Alcohol and du Pont that was to run from January 1, 1939, to December 31, 1939 (exhibit 34). Under this contract, Standard agreed to take a minimum of 2,500,000 gallons and a maximum of 3,000,000 gallons per annum of methanol at 17½ cents per gallon in tank car shipments, f. o. b. Belle, W. Va.

Standard continued to use this bargaining position with du Pont during the year 1939. On October 17, 1939, Mr. Hopkins wrote to Mr. Howard:

"Our antifreeze business depends upon the ability to obtain Methanol at a satisfactory price. As long as du Pont knew that we could use an I. G. process to manufacture Methanol they were willing to offer us terms, which make a plant of our own only fairly attractive. If, as a result of war conditions, we are not able to build a plant, it is to be expected that there will be difficulty over extending the present agreement" (exhibit 35).

The contract with du Pont in regard to furnishing methanol to Standard was renewed for another year on December 11, 1939, at the same price of 17½ cents per gallon (exhibit 36). Mr. Hopkins wrote to Mr. J. W. Casterton on January 25, 1940, informing him about the contract that had just been executed with du Pont. In this letter he says:

"As you know, it has been our policy to obtain protection by contract sufficiently in advance to permit time to construct a plant in case du Pont decides not to continue to give us favorable terms" (exhibit 37).

Apparently, the contract with du Pont was renewed for the year 1941, as a memorandum in the files dated June 27, 1941, states:

"Early this year du Pont notified us that they would probably be unable to supply our full requirements of Methanol. In general, the reason for this was that plant capacity previously used for manufacturing Methanol was being rapidly converted to the production of ammonia, which, in turn, is urgently required for the manufacture of nitric acid used in the production of munitions" (exhibit 38).

On the same day there was drawn up a request to Standard's executive committee for an appropriation to install a methanol plant for a capacity of 6,000,000 gallons per year (exhibit 39). It is my information that this plant was started, but I do not know whether or not it has been completed.

The following table is presented to this committee to show the published price of methanol during the period Standard purchased its requirements from du Pont:

Published prices of methanol—tank-car lots—f. o. b. works

[Source: Bureau of Labor Statistics]

From—	To—	Price per gallon
		Cents
January 1939	March 1940	33.
March 1940	April 1940	32.4
April 1940	August 1941	30.

The committee will recall that during the period covered by the above table, Standard received its methanol requirements from du Point at a price of 17½ cents per gallon, which is almost one-half the published price.

Mr. Howard, in a report to the executive committee on December 17, 1940, admitted that the contract price at which Standard received its methanol from du Pont was much lower than the market price.

"Mr. Howard stated that in Section II of the Standard Oil Development Company's 1941 Capital Budget there is $1,250,000 for a methanol plant, which is under

Digitized by Google

consideration because an important percentage of this material, which is used in Company interests' anti-freeze, is purchased from the Du Ponts. In 1939, 2,500,000 gallons were so purchased in 1940, 3,100,000 gallons were purchased from the Du Ponts, and estimates for 1941 indicate 3,500,000 gallons and for 1942 slightly over 3,500,000 gallons. There is some question whether such quantities could be secured from Du Ponts and, even if they could, whether it is advisable to do so when it is considered that a saving of 30% can be made by a plant for the manufacture of this material as compared with the price which is paid on the Du Ponts, *this in face of the fact that the 17¢ per gallon contract price with Du Pont is considerably below the going market of 25¢ per gallon*" (exhibit 40).

I. G.'S METHANOL CATALYSTS

All of the catalysts used by I. G. in the production of methanol apparently were not included within the September 1936 agreement. At a meeting held in England on March 19, 1937, between I. G. and Mr. Howard, it was brought out that—

"I. G. did not contemplate giving Standard experience on the preparation of the Methanol catalysts. * * * If for any reason it is not advisable to purchase the catalyst from the I. G., the Standard is free to go ahead with its own Methanol catalyst manufacturing, having a license under the I. G. patents for the preparation of a methanol catalyst. It is clearly understood, however, that the I. G. cannot give us any of the very special technique and experience which they have developed for the preparation of this catalyst" (exhibit 41).

Again on October 20, 1939, Mr. Fisher wrote to Mr. Howard that he considered Standard's bargaining position with respect to du Pont is exactly as good as it was before, "with some slight question as to the catalyst."

"You will recall that I. G. did not wish to disclose to us the method of manufacture of their latest and most efficient Methanol catalyst. About a year ago Dr. Hochschwender and Dr. Mueller agreed to have this information available here in New York so that we could get it in case of an emergency" (exhibit 42).

It appears from the letter that the information as to the catalyst was not in New York at that time.

A conference was held on February 2, 1939, between Mr. Howard and Mr. Russell, of Standard, and Drs. Hochschwender and Mueller, of Chemnyco, to discuss methanol problems. Standard officials explained the du Pont situation, and pointed out that they were worried about the question of the methanol catalyst. It was finally agreed that Standard would purchase its supply of catalysts from the I. G. and "as a further protection in the case of an emergency, the I. G. are willing to dispose in the United States full directions for the manufacture of its catalysts, which would be available to us if necessary" (exhibit 43).

Mr. Hopkins informed Mr. Howard in October 1939 that—

"No additional information is needed from the I. G. to build a plant, but we are dependent upon them for catalysts. Chemnyco advises Bud Fisher that we can purchase the catalysts from Germany under present conditions. * * * Bud suspects that Chemnyco has directions for making catalysts in this country, but they could not say so until authorized by I. G." (exhibit 44).

On January 24, 1940, Howard received a letter from Hutz & Joslin, patent attorneys for I. G. in the United States, in regard to the methanol catalysts. In this letter it is stated:

"With reference to conversations had between Mr. Fisher and Dr. Mueller, I wish to confirm that I have received from I. G. sealed envelopes containing detailed instructions for the preparation of two catalysts, one known as 'K 5050' and the other as 'Braunoxyd'. I was informed by I. G. that these envelopes were being deposited with me pursuant to arrangements they have made with the Standard Oil Development Co. I am to turn over the envelopes to you in the event certain conditions are fulfilled and am to return the same to I. G. only in case the Standard Oil Development Co. agrees thereto. For the sake of convenience, I am giving you below a translation of I. G.'s directions regarding the deposit of said manufacturing formulae:

"We ask that you take these envelopes in safe-keeping and turn them over to the President of the Standard Oil Development Co. in the event the following conditions are fulfilled:

"1. The envelope entitled 'K 5050': In case the Standard Oil Development Co. addresses such a request to you and at the same time convinces you that a

Digitized by Google

need for methanol catalyst exists in the proposed Methanol Plant of Standard Oil in U. S. A. licensed by us, which need cannot in any way be filled by deliveries from us;

* * * * * * *

"Should the Standard Oil Development Co. have need for * * * the 'K 5050' * * * catalyst formulae, please let me know and at the same time give me the required proofs that the conditions precedent for the delivery of these formulae have been fulfilled" (exhibit 45).

Mr. Fisher wrote to Mr. Howard on November 25, 1940, stating that in his opinion it was necessary to secure from Hutz & Joslin the two sealed envelopes containing detailed instructions for the preparation of the methanol catalyst as soon as possible (exhibit 46).

Mr. Minton, secretary of Standard's executive committee, wrote to Mr. Howard on December 17, 1940, that the executive committee had confirmed his view of the probability of a shortage in domestic supplies of methanol, and it was "so real as to warrant the Standard Oil Development Company applying to the escrow agent for the release of the I. G. methanol formula, which the Committee understands is in that agent's custody in anticipation of the need which has now developed" (exhibit 47).

Two days later Mr. Howard directed a letter to Hutz & Joslin requesting the envelopes containing the methanol catalysts (exhibit 48).

Messrs. Hutz & Joslin answered Mr. Howard's letter on January 3, 1941, and stated:

"I have your letter of December 18, 1940, in which you requested that I turn over to you the envelope entitled 'K–5050' containing detailed instructions for the preparation of the methanol catalyst. You will appreciate from my letter of January 24, 1940, that it is my duty to convince myself that the conditions set forth in I. G.'s letter of transmittal actually exist before turning this envelope over to you. I feel reasonably certain that this is the case, but, as a matter of precaution, have cabled to I. G. upon receipt of your letter asking it to cable to me immediately whether it can guarantee prompt delivery of large requirements of the methanol catalyst in this country. No reply has yet been received and I intend to send a follow-up cable, if none comes in within the new few days" (exhibit 49).

Messrs. Hutz & Joslin addressed another letter to Mr. Howard on January 13, 1941, and stated they had received an answer from I. G. in regard to the methanol catalyst.

"In this answer I. G. advises that it is prepared to supply Standard Oil Development Co.'s requirements of methanol catalyst via Japan.

"In view of I. G.'s advice I would suggest that you immediately place an order with I. G. for the amount of catalyst which is needed. You should emphasize your desire to have the material delivered to you as soon as possible I assume from I. G.'s cable that I. G. can arrange to make delivery within a reasonable time. Should you fail to obtain such delivery, please let me know" (exhibit 50).

On February 6, 1941, Mr. Howard addressed a letter to Hutz and Joslin and said:

"Our people have been trying to get methanol catalyst from the I. G. since November 8, 1939, on which date an order was placed for 500 pounds. It is our understanding that the I. G. did actually make shipment of this order but it got only as far as Rotterdam. Our representative in the Netherlands at the time, who is now in the United States, was advised in correspondence with the I. G. that they had effected delivery of the material to the extent that the matter was under their control and under existing circumstances they could not assume any responsibility for materials after they left the boundaries of Germany proper. The whereabouts of the catalyst at the present time is unknown.

"If we ordered another batch of catalyst from I. G. they could assume no responsibility for its movement after it left Germany. They can, therefore, in no wise insure delivery to the United States.

"Our need for the catalyst is such that we cannot take the time to place another trial order and wait to see whether or not it is delivered. Furthermore, if one batch of catalyst were delivered, we would have no assurance of being able to continue to operate the plan since operation would be entirely dependent upon obtaining a continuing supply of replacement catalyst.

"Under existing world conditions, the only way we can operate satisfactorily is to know how to make the catalyst ourselves. *It was in anticipation of exactly such conditions that the I. G. deposited the catalyst information with you.*

Digitized by Google

"In view of this record and the fact that our plans to take care of methanol requirements are already seriously jeopardized, I believe you will agree that the conditions set forth in the I. G.'s letter of transmittal of the envelope containing methanol catalyst instructions actually exist and that the envelope should be turned over to us immediately" (exhibit 51).

Apparently Hutz and Joslin still insisted that the conditions upon which the methanol catalyst had been left in their custody by I. G. had not been fulfilled by Standard, because on March 4, 1941, Mr. Fisher of Standard addressed another letter to Hutz and Joslin in which he stated that the I. G. have been unable to guarantee delivery and that the estimated delivery time was 3 months, which he considered entirely too long for Standard to wait.

"In view of the situation as it has developed, we would appreciate your prompt advice as to whether you consider that you are justified in delivering to us the catalyst manufacturing information which you hold. In case you do not, we shall immediately place an order with the I. G. although as stated above, delivery within the time estimated will seriously handicap us. Since the I. G. are unable to guarantee delivery and only estimate it, and apparently assume no responsibility for it, failure to deliver within three months would place us in a most serious position" (exhibit 52).

Finally Messrs. Hutz and Joslin transmitted to Mr. Howard on April 2, 1941, more than 3 months after the request had been made, the sealed envelope containing the method of preparing I. G.'s methanol catalysts. This information was transferred to the executive committee by Mr. Howard on the same date it was received.

CONSENT DECREE

Under the consent decree entered in the *Standard Oil case* at Newark, N. J., the methanol agreement of September 1936 was adjudged unlawful under the antitrust laws and Standard was enjoined and restrained from the further performance of any of its provisions. The methanol patents of both Standard and I. G. were opened to the public royalty free during the duration of the emergency.

CONCLUSION

This alcohol project emphasizes the cooperation which existed between I. G., du Pont, and Standard in that as a condition precedent to the granting of a license to practice the Methanol process, I. G. required Standard to satisfy du Pont as to its ambitions in the chemical field. In other words, I. G. demanded that Standard convince du Pont "that nothing inimical to their interests in the chemical business was intended" by I. G. in granting to Standard the right to operate under I. G.'s methanol process. We have also seen that Standard was not interested in competing with du Pont in the chemical field but, rather, adopted a policy which had as its "fundamental purpose" to cooperate to the utmost with du Pont.

The following facts may be deducted from the evidence submitted in this statement:

(1) Standard, by an agreement in 1936, received the right to I. G.'s methanol process in the United States.

(2) I. G. demanded that Standard work out a satisfactory agreement with du Pont before going into the production of methanol.

(3) Standard did not receive from I. G., when the contract was executed in 1936, the "special technique and experience" which they (I. G.) have developed for the preparation of this (methanol) catalyst. It seems fair to assume that Standard never did seriously contemplate using I. G.'s methanol process because it did not receive this "special technique and experience" from Hutz & Joslin, I. G.'s patent attorneys in this country, until April 1941. Therefore, it appears that the only reason Standard wanted this license agreement with I. G. was to use it as a bargaining power against du Pont in order to obtain a favored price on its purchases.

(4) Standard purchased its methanol requirements from du Pont from January 1939 through the middle of 1941 at a price which was approximately one-half the published price as shown by the Bureau of Labor Statistics.

(5) Standard, because it purchased its requirements of methanol from du Pont at a price lower than other purchasers, did not start construction of a methanol plant until late in 1941.

(6) Standard has a surplus of refinery gases in 1938 from which to produce methanol, as Standard's chemical committee met on July 15, 1938, to study the "utilization of Jersey's surplus hydrocarbon gases and chemical manufacturing."

Digitized by Google

From I. G.'s standpoint, it appears reasonable to conclude that it used the 1938 agreement with Standard not only to receive strategic information from Standard to produce isoprophyl ether for aviation gasoline and to satisfy du Pont that I. G. was not going to compete with them in this country in the chemical business, but also to prevent Standard from constructing a methanol plant in this country. I. G. could have relied upon the fact that by requiring Standard to offer to purchase its requirements of methanol from du Pont before it constructed a plant, that du Pont would make every effort to prevent Standard from constructing this plant and thereby becoming a producing competitor to du Pont. This of course is exactly what occurred. I. G. also knew that by preventing Standard from constructing a plant to produce methanol it would later retard our defense program because the plant could be readily converted into the production of ammonia, which in turn, could be used in the production of munitions.

This committee will recall that I. G. used its methane steam patents in this country in such a way that it hindered two of our leading explosive companies from obtaining licenses to use this process. This same motive could very well have been paramount with I. G. in licensing its methanol process.

The use of the methanol patents in this country is another example of how a cartel arrangement between two large corporations operates to the detriment of the public. If Standard had constructed a methanol plant and gone into production instead of relying upon du Pont, it is fair to assume that this country would be further advanced in its productive capacity.

EXHIBIT 141

STATEMENT BY WILLIAM S. FARISH, PRESIDENT, STANDARD OIL CO. (NEW JERSEY)

MR. CHAIRMAN AND GENTLEMEN OF THE COMMITTEE: Because these hearing were begun after we were at war, we assume that their primary purpose was to obtain opinion and data on changes which might be made in our patent laws to aid the war effort.

We are not experts in patent law. We are in the oil business. The oil business is one of the country's basic industries. It is conducted on a highly competitive basis. We do approximately 10 percent of the over-all oil business of the United States. To compete successfully in our industry we find it necessary to conduct a most aggressive campaign of research and development work and to improve constantly our processes, equipment, and products.

As a result of our efforts and expenditures, those employees of ours who are engaged in development work make a considerable number of new discoveries and inventions. On these inventions we take out patents. Our principal reason for taking out a patent is that it is the best evidence that the invention originated with us. It is the best way of meeting claims by other people that they invented it before we did.

A patent also gives us rights which we can exchange for other rights needed by us but held under the patents of other people. In almost every major line of progress in the oil industry several companies are always at work trying to solve new problems, and the general result is that each makes contributions toward the desired improvement. The processes and equipment used for most of the major operations in the oil industry are so complex that they represent an assembly of a very large number of inventions. Each of these inventions is covered by a separate patent. Sometimes the inventions originate with independent inventors, although most of them originate with the various companies in the oil industry who have been working in that field.

Let me give you an example: Company A may have developed, in crude form, a new chemical synthesis by which an old product is more cheaply made from some abundant raw material not previously known to be a source. Company B, taking the cue, evolves and patents new apparatus which will react A's materials in a much more efficient way than A had discovered. Company C, pursuing the matter still further, discovers and patents a catalyst which when used in B's apparatus will greatly hasten the reactions involved in A's synthesis.

All three companies are in the business of selling the old product. Without merging their patented knowledge, none of them may use the best form of the

Digitized by Google

new method of making the product; that is, C's catalyst in B's apparatus to carry out A's synthesis. Obviously, no one of them alone may lawfully do so. Company A cannot, because he would infringe patents held by B and C. Company B and C cannot because, if they did, they would infringe patents held by A.

As a result, the public interest in getting new and cheaper products is blocked, for without some solution to the problem the patented knowledge may be forced to lie idle. Clearly, public interest demands that Company A and Company B and Company C get together.

PATENT POOLS

As a practical matter, modern industry has had to find its own solution to this problem in the so-called patent pool. Parties who have contributed to the development and perfection of a new process find it necessary to get licenses under one another's patents. They also find it necessary to pool, or merge, their licensing rights under all the necessary patents so that other companies who wish to use the process but who have made no important contributions to its development can themselves get the right to use it by making a single contract and paying a single reasonable royalty. Such pools have now been formed at the request of the Government for synthetic rubber and the raw materials used in synthetic rubber. The Government has repeatedly recognized the advantages of patent pools in the public interest.

The situation with regard to specialties or new products differs somewhat from that involving major oil products. In the oil industry, as in most other manufacturing industries, it is natural for a company to wish to specialize in certain limited fields and to enjoy the reputation of being the outstanding supplier, or the sole supplier, for some special product.

The development of a profitable business in a new specialty is usually a difficult undertaking. A very large proportion of all the enterprises of this kind—even when started by the most experienced companies—are commercial failures, often after large expenditures for research and technical and commercial development. The successful ventures must therefore not only pay their own cost, but must also pay for the unsuccessful ones.

A fair patent system provides about the only workable form of incentive we know of which will actually result not only in continuous creation of new products, but in launching new enterprises based upon them. The prospect to the inventor of a 17-year exclusive right, during which he may make good profits if he is successful, does not provide any too great an incentive to developments in this field, and it is indispensable as an attraction of capital to a new enterprise.

GOVERNMENT RIGHTS

Government can never be blocked by patents. Since 1910 Government has had the statutory right, in time of war as in time of peace, to use any patented invention for its own purposes. Largely through the efforts of President Roosevelt in 1918, when Assistant Secretary of Navy, this right of government to use all patents was broadened by an amendment to the law so that not only Government but anyone else acting for it, or manufacturing goods for the Government, could utilize any patented invention without consent of the owner or without any negotiation with him.

Much of the testimony before his committee seems to have ignored these existing statutes completely, and has created the widespread impression that patents or patent agreements have actually prevented the Government from getting war materials manufactured. This, so far as our company is concerned, is not borne out by the facts.

While the purpose of these hearings was to gather opinion on proposed legislation, they have produced a secondary result which is very much our concern. Statements made by witnesses before this committee, widely publicized in the press of this whole Nation, were based upon misinterpretations of contracts, bolstered up by selected paragraphs, memoranda, and letters from our files. This was after months of examination of the files of our company, with our full cooperation to help get at the whole facts of the matter.

There are more than 50,000 American employees in our company. I have the responsibility of speaking for them. Like me, they and all other red-blooded Americans know that a man's reputation among his fellow human beings is the most precious thing that a man—or a company—possesses. I hope, therefore, that you will let me take the time here to set the record straight.

Digitized by Google

The case which the witnesses attempted to build against Standard Oil Co. is a jerry-built house. And the foundation of sand upon which the whole thing rests is the assumption that the executives of our company—representing a typical cross-section of America, some veterans of the last war, some now in the armed forces, some with sons how in our Pacific and Atlantic expeditionary forces—have for one single minute forgotten that the lifelong policy of every American is first, last, and always to put almighty America above any consideration of the almighty dollar.

And that assumption, gentlemen, hardly requires my challenge, since it is not true.

All of you know now the enormous advantages to the public of our contracts with I. G. Farbenindustrie of Germany.

Our first contract was made in 1927, a few months after Germany was unanimously elected to the League of Nations.

This was democratic Germany, and this was when it was taken into the League of Nations.

Although I first entered actively into the administration of the I. G. contracts some years after they were made, let me say that it is my own conclusion from a full knowledge of actual operations under these agreements that the United States got far more from Germany than Germany ever received from us.

We are human beings. In 1927 we could not foresee 1942. But I want to say to you gentlemen that if in 1927 and 1929 we could have read the future, if we could have known that the Japs would strike Pearl Harbor on December 7, 1941, we would have been even more anxious than we were to sign those contracts to permit us to weave into technical knowledge and experience of the industries of our country a large part of the technical advances of modern German science. From catalytic chemistry applied to the hydrocarbons of oil over the period of this contract have come a long list of the industrial miracles of our present war production.

Out of our relations with I. G. Farbenindustrie America got (1) the first process for producing 100-octane aviation gasoline, one thing which puts the planes of this country and the United Nations ahead of the Axis; (2) synthetic toluol, the basic ingredient of the military explosive TNT, which has tremendously increased our capacity to manufacture this war necessity here in the United States.

Half of the bombs we are dropping on Japs and Nazis are made possible by the research based on that contract with I. G. Farbenindustrie. Today military leaders look upon the long-range bomber as the greatest single potential weapon for winning this war. American industry has performed miracles in producing vast quantities of these bombers. Without synthetic toluol we could not have made use of half of these bombers—there would be no bombs for them to carry. And without the 100-octane gas bombers used in their motors, which also originated from what we learned from I. G. Farbenindustrie, they would not have the flying range to get there and back.

From I. G. we also got (3) the most modern and efficient methods and apparatus for the manufacture of synthetic ammonia, the other ingredient of TNT, from natural gas; (4) paratone, which greatly improves hydraulic and recoil oils, and is used in every fighting plane, tank, cannon, and ship in the Army, Navy, and Air Corps; (5) paraflow, which freeze-proofs our best motor oils; (6) Buna rubber processes, which today are the foundation of the American synthetic rubber program; (7) Butyl rubber, potentially the most important of all synthetic rubbers, and which was developed from (8) vistanex, one of the special types of German synthetics, which are better than natural rubber for certain strategic purposes.

The I. G. contracts started us on the road which led to work on synthetic rubber. We spent millions of dollars on rubber research and production facilities before Pearl Harbor. At the time of Pearl Harbor Standard Oil Co. (New Jersey) had under construction entirely with their own capital nearly 20,000 tons per annum capacity of synthetic rubber and synthetic rubber raw material, an amount almost as great as the German Government had provided for itself before it went to war. Every oil synthetic rubber plant now being built by the Government is being built in large part with our plans and as the result of our engineering.

Gentlemen, what do you think Hitler would give today to be able to keep America from using these discoveries and processes?

A little later on I want to take up, one after another, some of the distorted pictures painted by the witnesses who have appeared before you. Since they bear upon our contracts with I. G. Farbenindustrie, let me start at the beginning

Digitized by Google

and tell you the story of what these contracts were and how we came to make them.

You will recall the setting under which our negotiations began in 1925—17 years ago. When the Germans were defeated in 1918, one of our invisible allies was the movement toward democracy and the rebellion against autocracy among the German people themselves. Our Allied victory made possible the creation of a democratic form of government in Germany. It was this new democratic Germany, struggling toward a respected place among the family of nations, that we were dealing with when we made our agreements.

In 1925 several officials of the I. G. Farbenindustrie were making a tour of the United States and asked permission to visit one of our refineries. We took them through our New Jersey refineries and laboratories and invited them to lunch with our directors afterward.

At luncheon they told us they were themselves doing some scientific work on oil, and that when they had progressed further they would like to have us visit their laboratories.

WE ARE SHOWN I. G.'S LABORATORIES

The next year 1926, they invited us to visit them at Ludwigshaven, Germany. This invitation we accepted and we were shown there for the first time the laboratory and pilot-plant work being done on hydrogenation of coal and of oil. Remember, 1926 was the year that the Assembly of the League of Nations unanimously admitted Germany to the League and to a permanent Council seat.

We were impressed with the scale and efficiency of their research, with the progress they had made on hydrogenation and with the potential industrial value of these inventions. We at once expressed our desire to find some basis on which we could take part in this new development.

After a year of discussion an agreement was first arrived at in 1927, under which we took over a half-interest in the oil hydrogenation process in the United States only. We gave to I. G., in lieu of cash payment, a half-interest in the proceeds from licensing some of our own refining processes. Under this arrangement, the financial interests were therefore equal, no matter who originated the invention, but the agreement provided that the original owner would have the deciding voice in licensing it.

It was agreed that Standard and I. G. would cooperate technically to the fullest extent in improving oil-refining processes, especially hydrogenation.

The 1927 agreement was to run until 1952. Remember, 1927 was the year that Germany dynamited all of the fortresses on her eastern boundary in accordance with the Paris Agreement. Because of this relatively long term, and because the last patents which would come under the agreement would have a life of 17 more years, during which the parties would be forced to remain limited partners, it was realized that many unforseen situations would arise. It was apparent that we would have to rely more on good faith than on legalistic interpretations, if the arrangement was to be a workable one.

A LETTER OF GOOD FAITH

Someone suggested that this situation be met by supplementing the agreement itself with an exchange of letters between the heads of the two companies—a declaration of good intention, good faith, and desire on both sides to settle any future questions which might arise in the spirit of of our agreement, instead of attempting to stand always on strict legal rights as these legal rights, or the abilities of the parties actually to enforce them against one another, might change over the years.

Fifteen years later, the Antitrust Division labeled this letter, which had been carried forward in the same language when the parties made their subsequent agreements in 1929, a coordination agreement, supposed to link together the several contracts of 1929 into an imaginary world cartel for the oil and chemical industries.

Now to me the word cartel means a combination of competitors to control production and fix prices.

I have read Mr. Arnold's article in the Atlantic Monthly for July 1942, in which he explains his understanding of what he means by a cartel:

"It inevitably pursues a policy of high cost and low turn-over, because short-run profits are always more attractive to a cartel than the struggle for competitive efficiency which comes of full production."

Digitized by Google

Let me say right here that our relations with I. G. have never constituted a cartel under either of these definitions.

The 1927 declaration of good faith from its origin had no possible purpose or effect except to record the good intentions of the parties under a simple oil patent contract applying to the United States only. The Antitrust Division represented it to the world as a separate pact made to coordinate the 1929 agreements—a pact by which Standard Oil and I. G. were to override all laws in effecting their purposes in the chemical field. It was not until a week or so ago that Mr. Gibson, of the Antitrust Division, publicly acknowledged that the "coordination agreement" of 1929 had, in fact, originated with the discussions of the first simple United States oil patent agreement.

A memorandum, made by I. G. in 1927 and taken from their files by the Antitrust Division in 1941, reported a discussion in which one of the I. G. officials somewhat extravagantly characterized this simple 1927 United States oil patent agreement, then under negotiation, as a "full marriage" between the parties. This statement was quoted and erroneously applied to the 1929 agreements as further proof of an alliance to rule the oil and chemical industries of the world.

Now I want you to bear this in mind in everything that follows. That quotation "full marriage" and that simple letter of good faith which was inflated into a significant "coordination agreement," were two of the foundations upon which they rested their jerry-built house.

CONTRACT INADEQUACIES

Just because it was so limited in its scope, the 1927 agreement was found to involve difficulties for both parties.

It did not prevent controversies over foreign rights to inventions resulting from the cooperation of both research staffs. There was still left the prospect of jealousies and disagreements which would tend to defeat honest technical cooperation in improving processes which both parties intended to license to the whole oil industry.

Also, the field of coal hydrogenation had been left completely outside of the agreement, even in the United States—because I. G. had valued this process so highly that it was unwilling to put it into the arrangement.

Standard Oil and I. G. were thus left in the anomalous position of cooperating to develop the oil hydrogenation process, at the same time not cooperating with one another in applying the results of their cooperation to the hydrogenation of coal, where much of the same improved techniques were useful.

I. G. also complained that it would be highly unfair if Standard were to take advantage of the new training in catalytic chemistry it was receiving from I. G. to embark in the purely chemical field by promptly applying this catalytic knowledge, for example, to the manufacture of dyes.

While Standard was quite willing to disclaim any intention of departing from the oil busines to enter the strictly chemical field, we had some small investments and some large ambitions in branches of the chemical business closely related to oil.

There was a further source of friction. Growing out of Germany's difficulty in paying for imports from foreign countries was the nationalistic urge to create synthetic oil from German coal. Although this meant loss of markets for our American oil, there was nothing we could do about it. What we thought we could do something about, however, was to protect the larget investment we had built up in German over the last 40 years. I. G., in marketing its synthetic oil, was ambitious to build up a duplicate distribution system for this new product paralleling the entirely adequate distribution system which Standard owned in Germany for handling its own imported gasoline. We hoped to persuade them that this was unnecessary and unsound.

A NEW CONTRACT

In 1929 therefore an effort was made to solve these problems by substituting for the original simple United States patent agreement of 1927 some arrangement which would be fair and workable on all matters which experience had shown must be provided for. By this time the technical departments of I. G. and Standard had been cooperating for 2 years. We had gained a wholesome respect for the research ability of their organization. We knew that we were just beginning to bring into this country most valuable knowledge on what catalytic chemistry could do in opening up new horizons for our whole oil industry.

Digitized by Google

Remember, 1929 was the year that the German Reichstag ratified the Kellogg Peace Pact.

The main agreement of 1929 was a simple purchase. Standard bought, for the world outside of Germany, full control of, and an 80-percent financial interest in, all of I. G.'s oil and coal hydrogenation processes, as well as their other inventions on oil refining. The 20-percent financial interest left with I. G. was for the purpose of keeping them active and interested in helping Standard with research to improve the processes.

I. G. refused to sell any of their patent rights for Germany, but a working arrangement between the two companies was arrived at under which Standard could continue, and expand, its regular oil refining business there and, in addition, handle on a profitable basis, through its local distributing organization, products made by I. G. in Germany from coal hydrogenation.

This straightforward purchase, widely hailed at the time in American newspapers, is the thing that is falsely labeled a world cartel for oil.

To give added color to this cartel picture they went to the length of quoting, as apparently having some pertinence, a provision which they found in an agreement between I. G. and the Shering Corporation (a company with which we have never had any relations of any kind) as follows:

"The existence, the content and the details of this agreement have to be kept secret by both parties notwithstanding the possible obligation of disclosing it to public officials."

This agreement we have never heard of, and we have always been at a loss to understand why it could have been considered either just or pertinent to inject an unverified and unexplained quotation of this kind from somebody else's records into an alleged exposition of our contract relations and policies. We are quite sure the members of this committee will agree with us that such procedure violates the rules of fair play.

How anyone could apply the term "cartel" to this 1929 purchase of German inventions is beyond our understanding. Our own views and intentions can best be judged by what we did. Even before we signed the contract we started to arrange for the sale of the oil and coal hydrogenation processes to the American oil industry at large through an industry company organized to take control—leaving us with only a minority stock interest and a right to future royalties.

We passed into the hands of the oil industry the control of, and responsibility for, new hydrogenation techniques which but for our purchase would certainly have been used by the German owners for their sole benefit. We were not trying to organize any cartels or to limit or prevent competition in the oil industry in any way. We are only a fraction of the world's oil industry, but we know that our own security rests on the general health and prosperity of that industry as a whole.

SUPPLEMENTARY AGREEMENTS

Supplementing the main agreement which dealt principally with hydrogenation processes, there were two other agreements, one relating wholly to Germany and the other to chemical processes. The agreement relating to Germany covered the sale by Standard of the gasoline made from coal in Germany and contained option provisions under which I. G. was to get rights to purchase shares in Standard's German subsidiary. It has never been able to exercise these options.

The difficulties which we had found to exist between us in the chemical field have already been referred to. The solution of these difficulties was attempted in a separate agreement, the provisions of which were as follows:

Each party confirmed the understanding of the other that it did not intend to depart from its existing policies to enter the industrial field of the other. I. G. was simultaneously selling to Standard all of its oil refining patents, and would therefore be handicapped if it tried to enter the oil business outside of Germany. There was therefore all the more reason why it should ask us to stipulate that we did not intend to depart from our own line of business, take advantage of the education in catalytic chemistry received from I. G. and attempt to set ourselves up in the general chemical business.

While these expressions of policy and intent were made in good faith, there was no actual prohibition against either party buying control of, or starting a company competing with the other anywhere in the world. The actual effect on their future operations was only the effect resulting from the sale of new developments to each other. In Standard's case, this was an agreement to sell to I. G. control of any new chemical development not closely related to Standard's

Digitized by Google

then existing business. There was a corresponding agreement by I. G. to sell to Standard control of any new chemical development so closely related to the oil business that it could only be carried on effectively as a part of the oil business. This still left to be settled new chemical developments which would be related to the then existing business of Standard (as for example, by the use of natural gas or petroleum products as raw materials) but which were not so closely related to the oil business as to be incapable of growth as independent enterprises.

I. G. agreed to offer to Standard a substantial but not controlling participation in any such new developments originating with them. The terms upon which I. G. would actually offer such participation, and the extent of such participation, were left entirely open.

Standard itself assumed no corresponding obligation. We were therefore in the position of having obtained a broad general option for a minority participation in I. G. oil chemical processes—even though they could be developed entirely independently of the oil business—while still retaining our own control over our own oil chemical processes of a similar character.

Without knowing the details, we knew that I. G. had gone very far in the development of several important processes for the production of chemical products from oil raw material. We knew that they were about ready to commercialize manufacture of fertilizers from natural gas, that they had processes for making acetylene from refinery gas, that they could make some kind of synthetic rubber from this acetylene, and that they were also working on the production of soap from paraffin wax. We were well satisfied, therefore, that our option would be of some interest and value to us in the future. And remember, the only thing we gave for it was a promise that we would not do something we had not done for 50 years and had no intention of doing in the future; that was, to make a sudden jump completely outside of the oil business and start ourselves up in the general chemical business.

This agreement which I have just described to you is the Antitrust Division's imaginary chemical cartel. It is the foundation of the claim that we violated the antitrust laws of the United States. We were absolutely sure that the agreement was proper and constructive, that it would advance the interests of our Nation, the American oil industry, and our company. We were advised by the most competent counsel that it constituted no violation of the antitrust laws.

A COOPERATIVE RESEARCH COMPANY

As I told you, the 1929 agreements gave us a general option to acquire an interest in oil-chemical developments of I. G. But the general option necessarily left unstated the terms on which any particular interest in any particular invention would be offered. It was therefore "an agreement to agree" rather than a final contract.

Actually we did not know at that time exactly what oil-chemical developments I. G. had or how valuable they might be. After the 1929 agreement was signed they gave us more specific information both on what they were doing and on what they hoped to do in this field of converting oil raw material into chemical products—soap, acetylene, and rubber.

After a year of study and talk we made another step forward. We worked out the Joint American Study Co. agreement, which was, with slight variation, a method of implementing the general option which we had obtained in 1929. It was agreed that we would organize an American corporation, the Joint American Study Co., afterward abbreviated to Jasco, in which the two companies would be equal partners. This company was the vehicle through which there were to be developed and licensed the processes of making chemical products from oil raw material.

The arrangement had one extremely significant provision, however. This was that neither party was obligated to put into Jasco any development, no matter what its nature, in a business in which he was already engaged. The whole thing was therefore limited in its scope to brand-new developments not yet commercialized by either party. This relieved Standard of all obligations to I. G. on the only lines of oil-chemical work on which it had any existing assets or prospects—the manufacture of alcohols and similar chemical solvents from oil and the manufacture of antiknock compounds for gasoline. In 1929 we had invested in these oil-chemical fields about $3,000,000, and we expected this business to grow. It has grown. Our investments have increased from about $3,000,000 to about $30,000,000.

Digitized by Google

As a result of this provision, I. G. was obligated to put into the new joint company many processes not yet commercially used, but upon which it had spent great sums of money—such as the acetylene process, the soap process, and the buna rubber process. On the other hand, Standard had no countervailing asets to offer.

THE REAL EFFECT

This inequity was met by adhering to the 50–50 ownership, but adding the provision that the party originating any process should receive five-eighths of the financial return on that process, and the other party only a three-eighths interest. It was natural that the majority interest should have the deciding voice on development and licensing.

In the practical operation of Jasco, therefore, the parties adopted the natural rule that the one originating a particular process should also have control of it.

The Jasco arrangement had the effect, therefore, of giving to Standard a three-eighths interest in some new oil-chemical processes in return for simply putting up one-half of the money used in their commercial development, and the development itself was to be done in the United States.

Standard was then a novice in this field. It had its education still to get. It had at the time no processes to contribute and, as a matter of fact, never contributed any during the 10 years of this arrangement. But if it had ever had any such process to contribute it would have given up only a three-eighths interest and retained control.

BUTYL BELONGS TO AMERICA

Mr. Gibson told you that we would not have had control of butyl rubber, even though we would have had a five-eighths financial interest in it. He is entirely wrong. Butyl rubber has not been and connot be, made on a large scale except as part of an oil business, and therefore control automatically remained with us under the 1929 agreement. The 1930 agreement only confirmed this situation, since under it the parties soon adopted the sensible working rule that the originator should have control.

The butyl rubber process of course came within the terms of the Jasco arrangement and would have eventually come into Jasco if the war had not intervened. If so it would have been a partial offset to the buna and other processes which I. G. had put in. As a matter of fact, the war did intervene and the entire arrangement was recast into a geograpical division rather than a partnership of the parties throughout the world, so that I. G. never even acquired a minority interest in butyl rubber in the United States, where its principal value will certainly always lie.

SUMMARY OF CONTRACTS WITH I. G. F.

The net result therefore of the so-called chemical cartel created by the 1929 general option agreement and the 1930 agreement implementing this general option was that Standard acquired a minority interest in a group of oil-chemical processes which I. G. had developed and owned and would have continued to own exclusively except for this arrangement. Standard gave in return an agreement to sell to I. G. at a price to be determined at the time, control of chemical inventions entirely outside the oil industry, none of which inventions of any consequence Standard had made before or has made since. In addition we agreed to give a minority interest in Standard inventions in the oil-chemical field, outside of the lines in which Standard might be engaged at the time. Although Standard's oil-chemical business actually expanded tenfold between 1929 and 1941, this expansion was in fields outside of the I. G. contract, and the first process of Standard's within the scope of this alleged world chemical cartel was the butyl process, which will become a commercial reality in the United States for the first time this December, 3 years after the Jasco contract was completely revised to eliminate all interest of I. G. in the United States patents coming under the contract.

SYNTHETIC ACETIC ACID

Now let me take up specifically some of the statements of witnesses who have attacked us here before you.

Mr. Irving Lipkowitz, an economic expert in the Antitrust Division, took more than a day of the time of this committee painting a distorted picture of our op-

Digitized by Google

erations with acetic acid, acetylene, and acetaldehyde. His own summary of this story was this:

"During the early 1930's I. G. Farben of Germany held the United States patents on a new and promising process for making acetylene, the principal material used in the manufacture of synthetic acetic acid. By an adroit manipulation of these patents, and by a clever use of its partnership with Standard Oil of New Jersey, I. G. Farben succeeded in preventing the full development and utilization of that process."

As Mr. Lipkowitz says, I. G. owned the process and the patents on it granted to them by our Government. When we signed our contract with I. G. covering this process they became obligated to put up some money with us for experiments to see what could be done with it. Those experiments cost $1,500,000, half of which I. G. had to put up. Out of those experiments we hoped to find a missing link in the synthetic rubber chain (cheap acetaldehyde), and incidentally to recover the cost of the work by selling any acetic acid we produced.

Now, gentlemen, if I. G. had wanted to prevent the development and utilization of this process, all they had to do, obviously, was not to sign such a contract with us. It was the contract which started something—not stopped something. Let's put it in the simplest terms. I. G. owned a mining claim. They gave us a share of the claim on condition that we put up some money jointly with them to sink a shaft and see if we could get any ore out of the mine.

This the witness called a deep-dye plot of I. G. to stifle the production of ore.

I may add, gentlemen, that after spending $1,500,000 we found out that the mine was worthless. We were never able to produce either acetylene or acetic acid by these methods on a commercially attractive basis, although we often thought we were just on the point of doing so. Nor were we ever able to persuade anyone to buy a license for the process, although we peddled the process industriously in an effort to get our money back that way.

The experiments on this process were conducted in the United States over the period 1931 to 1935. When these experiments were started, we had at Baton Rouge, La., power costing approximately 2 mills per kilowatt-hour. We also had a special cut of refinery gas from which the acetylene could be made with less power requirements than from any other cut. However, by 1935 our cost of available power at Baton Rouge had increased to about 4 mills per kilowatt-hour and shortly thereafter we were using the special cut of refinery gas for making another chemical product, ethyl chloride, needed in our business. As a result of these two factors, the cost of power for this process for producing acetylene from refinery gas was increased by about 120 percent. This was primarily an electrical process so that the cost of power was a controlling factor. Without cheap power and cheap gas it offered no attraction for us or anyone else.

So far as we are concerned, the most important outcome of the whole thing is that we satisfied ourselves that this process, which was the original I. G. scheme for making rubber from oil, was not going to work in the United States.

You gentlemen know the patent laws of this country. If the inventor wants to he can sit still for 17 years with his patent and not use it himself or let anyone else use it. You have often considered whether this phase of the law should be amended, and so far you have always decided that it shouldn't. Our contract forced I. G. to do something with a patent which they could otherwise have continued to let rest in peace. Since they had owned the patent in the first place, they still retained the deciding voice on just what was to be done with it, but after they signed up with us they had to do something, and in all fairness to them, they did—they spent their half of $1,500,000 and they taught us a lot of things.

The witness also drew the fanciful conclusion that we started to tear down the pilot plant used in this work on orders from Germany when Germany went to war in September 1939. The fact of the matter is that by the end of 1937 we had virtually abandoned experimenting in the production of acetylene and acetic acid and beginning in 1936 parts of the pilot plant were taken for use in the ethyl chloride plant, since that was a more promising experiment. In May of 1939 our own people at the Baton Rouge plant suggested that instead of spending more money for maintenance we should dismantle the plant and salvage whatever we could. Acting upon our own suggestion, several months before Germany went to war, steps were taken to carry out this decision by listing all equipment for sale or transfer and arranging to dismantle the outside structures which could not be used for any other purpose.

Thus there is no support in fact for the long and fanciful tale of the witness in respect to the acetylene and acetic acid venture.

PARAFLOW

Mr. John R. Jacobs, also a special attorney in the Antitrust Division, took a day of your time to present to you his picture of the injury to American interests which he says resulted from our handling of two inventions—called Paraflow and methane steam.

That witness summarized his testimony as follows:

"My testimony before this committee will be limited to a discussion of a product called paraflow and the methane steam process, both of which were directly affected by the cartel arrangement of 1929 between Standard Oil of New Jersey and the I. G. Farbenindustrie of Germany. The formation of this cartel between these two industrial empires operated, as to paraflow, to create a complete monopoly and give to I. G. royalties which should have gone to American industry. As to the methane steam process, the effect was to restrain its use and thus to prevent our strategic explosives industry from obtaining necessary licenses under the patents to increase our war production."

Let me dispose of that, also, in a few words.

A CHEMICAL CURIOSITY

I. G. had discovered how to make a very expensive synthetic lubricating oil which was to them only a curiosity and for which they had no practical use. One of our chemists, who had been searching for years for something to put into the highest grade Pennsylvania automobile oils to keep them from freezing in cold weather, picked up a laboratory sample of this German chemical curiosity on a visit to their laboratories, brought the formula home, and found it was exactly what he was seeking. He patented the process for freeze-proofing Pennsylvania type oils by adding a small quantity of product of the chemical nature of this German synthetic oil. But the only way we could make any such product practically was to get a license from the Germans to manufacture their chemical curiosity in America. We were entitled to do this under our 1929 agreements, but we had to pay a small supplementary amount to I. G.—as provided for in the same agreement.

The actual amount paid them was 3½ percent of the profits of the business. This is the basis for the witness' statement that we "gave to I. G. royalties that should have gone to American industry."

The entire paraflow business, which turned out to be a profitable one and some consolation to us for our share of the $1,500,000 we had just dropped in the "worthless mine" I told you about, could never have been started if the I. G. organic chemists had not discovered this chemical curiosity and handed us a sample to play with.

Now as to the monopoly business. We never had any monopoly on paraflow except the 17-year monopoly the patents gave us, and that is what Government patents are for. Other companies started manufacturing freeze-proofed oils that infringed our patents or conflicted with our pending applications. In order to avoid extended controversy and litigation over patents with respect to these conflicts, we settled the controversies by acquiring the conflicting rights or granting limited licenses under our patents, in each case without interfering with the use by the other parties of their products in the sale of their oils.

The truth of the matter is that no one has yet succeeded in getting up a competing product which does not depend on our patents and which is of good enough quality to take any large amount of the paraflow business.

Whatever monopoly we have enjoyed has been due to the merits of the invention and of the product.

Trade statistics show that there has been a reduction in wholesale price in these freeze-proof oils of about 2½ cents a gallon, which has resulted from the general use of paraflow in place of the more costly methods previously used to make an oil of inferior all-around quality. We have been fortunate enough to make a profit out of this invention. The public has gotten better automobile oils at lower prices.

METHANE STEAM PROCESS

In their study of the manufacture of synthetic ammonia, which is one of their main lines of business, the I. G. had invented a process for producing hydrogen from methane and steam. This also seemed to be the best process for getting the hydrogen needed for oil hydrogenation. So when we bought the hydrogenation rights we took the rights to this methane steam process, but only for hydro-

Digitized by Google

genation, not for synthetic ammonia. We have never been in the synthetic ammonia business, but we developed the methane steam process here in America on a large scale in connection with our oil hydrogenation. We improved on it and got som patents of our own on the improvements. We gave our designs to several large refiners and some of the best engineering contractors—always with the understanding that the rights we gave them under any patents of I. G. were limited entirely to hydrogenation of oil and coal.

When the national defense program had gotten under way here there was need for new synthetic ammonia plants. Some of the contractors who were negotiating for these new ammonia plants wanted to use the methane steam plant designs which they had gotten from us for use in oil hydrogenation. Germany was, of course, already at war. Efforts by the contractors and by us to get any action out of the I. G. in Germany on patent licenses for these synthetic ammonia plants proved fruitless. We therefore took it upon ourselves to see that the Government was advised, knowing that they had full power to cut this legal Gordian knot—the only thing that stood in the way of using the underlying German inventions for producing the hydrogen for synthetic ammonia.

CUTTING THE GORDIAN KNOT

Our procedure was to write the engineering contractors, explaining exactly what the situation was, then take the letters down to Washington and review the problem with the Office of Production Management, the war agency handling the matter. Our files show that this conference took place on August 25, 1941, with Dr. Reed, head of the Chemical Division, and Mr. Eaton, Associate General Counsel of Office of Production Management. The Office of Production Management Officials took all necessary action to deal with this matter. Since it is of interest I will pass on to you statements, which I believe to be reliable, that six large ammonia plants, built under Government sponsorship and making about one-half of all the emergency ammonia to be produced in connection with the war effort, are using this process. The engineers estimate the savings of money and proportionate savings of steel and other critical materials from the use of this process to be somewhere between twenty and forty million dollars as compared with the next best process. I should explain to you that the ammonia made for war purposes goes into explosives.

The witness's summary of the methane steam matter was: "As to the methane steam process, the effect (of our contracts with I. G.) was to restrain its use and thus to prevent our strategic explosives industry from obtaining necessary licenses under the patents to increase our war production."

On the contrary, the effect was to give to this country, in advance of the war, all the knowledge and plant designs necessary to go ahead with the best process for synthetic ammonia whenever the need arose, so that by a simple act of a war agency al lof the patent complications, assumed by the witness to have been sufficient to hamstring the United States Government, were swept away.

SYNTHETIC RUBBER

On May 20, 21, and 22, 1942, Mr. Robert M. Hunter, a Special Assistant to the Attorney General, presented to your committee his interpretation of 230 documents having to do with synthetic rubber. When these 230 documents are considered on their own merits, apart from the interpretation of the witness, they show a record of which we are proud.

That witness, in introducing himself to you, confessed that his knowledge of these matters had come almost exclusively from such files of the Standard Oil Co. as he had been able to examine and that he might "have distorted the picture of some matters widely as a result of the limited horizon" he had. He admitted also that he "had no chemical background," and that he did not "hold himself out as an expert on synthetic rubber, either as to the chemistry of it or any other phase of it."

The synthetic-rubber problem is inherently one of the most complicated chemical and industrial problems this country has ever had to face. Many competent men have given the Congress and the public honest and correct appraisals of the difficulties that had to be met but in my opinion these difficulties have been enormously aggravated by the widely publicized statements of a number of fake experts and notoriety seekers who didn't know what they were talking about. Unfortunately, most of them have lacked the frankness of Mr. Hunter in ad-

Digitized by Google

mitting their inadequacies. The fact remains, however, that the American public has been confused by what they have said.

I shall try to tell you the plain facts about this matter so far as our company is concerned in terms of plain common sense and without technical detail.

ORIGIN OF BUNA

The German I. G. developed a product called Buna rubber, which they made from coal. Under our 1929 and 1930 agreement we were entitled to a three-eighths interest in Buna rubber outside Germany, but only to the extent that it was made from oil or natural gas. The German Government subsidized the work in Germany on producing buna from coal, beginning sometime around 1935 or 1936, and at the outbreak of the war in September 1939 they had just gotten into operation their first large-scale commercial plant of 25,000 tons capacity, which was probably about one-tenth of their war requirements.

There was at that time no commercial production of buna rubber in the United States, but there had been nearly 10 years of study of the problem of producing buna from oil by us here and we had had considerable help from the I. G. The bottleneck was how to get butadiene cheaply enough and in large quantities. I told you that our company and I. G. spent a million and a half dollars between 1931 and 1935 on a process which was supposed to provide the missing link but which turned out to be much too expensive.

Both I. G. and Standard had tried out several other methods of producing butadiene from oil on a small scale and we knew they would work. We also knew that buna rubber itself had been developed into a fairly good product—good enough to be reliable as a tire rubber in case of necessity. There was also a good prospect for a small commercial business making special high-cost grades of buna rubber for special purposes. At the end of 1938 I. G. and Standard were conducting initial conversations with the leading rubber companies in the United States on the merits of the buna rubber process and product.

FIRST AMERICAN BUNA TIRES

During 1939—at the very time when Hitler must have had his war all planned—five leading rubber companies in this country were running tests on buna rubber tires, using product which I. G. had supplied them at our request. Actual manufacture of the tires was carried out with the help of an expert sent from I. G. for the purpose.

At the time the war broke out in Europe what was wrong with this picture? Only one thing—that is, the process still belonged to the Germans, and we had only a minority interest.

Our solution of this situation was to eliminate I. G.'s interest in the buna process in the United States completely. We proceeded at once. Before the end of September 1939, an agreement had been worked out under which we were to take over all of the rights in the buna rubber process for the United States and the British and French Empires, and give up all our rights for the rest of the world. Within 1 month after Europe went to war, and more than 2 years before America went to war, we had eliminated all foreign interest in this process and were free to do with it whatever seemed necessary.

In 1939 almost everybody in this country, including our national leaders, hoped and believed that we could keep from being drawn into war with anyone. But if we had been gifted with foresight, if we had known that we would be at war with Germany in 1942, we could have taken no wiser step.

MUNITIONS BOARD GETS DATA

What did we do with buna rubber when we had eliminated foreign control? We did three things: First, we reported the situation to the Army and Navy Munitions Board in November 1939 and asked for advice. From that time to this we have been constantly in contact with all appropriate agencies of our Government and followed the advice they gave us. The first advice given to us by the Army and Navy Munitions Board was to try to interest the rubber companies in some sort of common effort to develop buna rubber in the United States, in the belief that such concerted effort would afford the best foundation for the necessary Government assistance in developing the new industry as a safeguard in case of emergency. We made plans to pool our interests with

Digitized by Google

the rubber companies as suggested by the Army and Navy Munitions Board, but the plans were not approved by legal counsel.

The second thing we did was to begin at once our own plans for buna rubber production in the United States. We had the advantage of a 10-year background of study of butadiene production, which was the real problem. Actual production of the rubber was relatively simple. By the time America went into the war we were in commercial production of buna rubber and had nearly finished our first oil butadiene plant, which was designed for about 10 tons a day. This gave us a production which exceeded our ability to sell the product at that time.

The third thing we did was to offer licenses to all the rubber companies we thought would be interested in producing buna rubber. Two out of the four largest companies, Firestone and United States Rubber Co., accepted these licenses promptly, and Firestone began commercial production. The other two companies who were interested in synthetic rubber, Goodyear and Goodrich, preferred to continue to develop their own processes, which though very similar to the buna process, were not, in their opinion, under the buna patents.

In the 2½ years prior to Pearl Harbor, our company submitted on 46 occasions samples of various synthetic rubbers to 7 different Government agencies or their appointed representatives.

It was not until the middle of 1941 that the Government itself undertook to do anything definite about buna rubber production. We gave Government agencies all possible assistance and never suggested that our company should have any preferential position in the Government's manufacturing program.

PEARL HARBOR

With the outbreak of war in the Pacific, the Government acted promptly to greatly expand its rubber program. To expedite this, it wanted to get a complete pool of all patents and all information which anyone had on buna rubber. The pool was formed within 2 weeks after Pearl Harbor. We threw in all of our improvement patents, as did other parties, without royalty. A royalty of 1 percent was allowed us for the basic patents for the period of the emergency, rising to 2 percent after the emergency. Again there was no question of preference of any kind to our company in the actual manufacture of the rubber or in any of the raw materials for it.

As you all know, the buna rubber program is the foundation of the entire synthetic rubber program of the Government. They expect to make, as far as we know now, 700,000 tons a year of buna rubber. In this program we agreed to supply 7,000 tons of butadiene from a plant that we already had under construction, financed with our own money, before Pearl Harbor, and 45,000 tons from two plants we are building for the Government. We offered to make raw materials. At one time, impatient for quick action from other companies, the Government asked us to assume larger commitments for butadiene. This we were willing to do, but these additional commitments were very soon undertaken by others.

While we ourselves are making only a small percentage of butadiene for the Government's program and absolutely none of the buna rubber itself in this program, plant designs and detailed processes for buna rubber and for butadiene manufacture based on our engineering are being used widely throughout the rubber and oil industries under the information and patent pools which the Government initiated with the approval of the Attorney General.

BUTYL RUBBER

To complete the rubber picture I want to comment only on one more thing—butyl rubber. Our chemists first hit on this product in 1937 as an outgrowth of their work on a somewhat similar product, vistanex, a rubberlike substance which we had obtained from I. G. In 1937 and 1938 we filed patent applications for this butyl rubber in the United States and many other countries and at the same time reported it to I. G. as a development which would come under our contracts. We did not think at the time, and we have never had any reason to think since, that butyl rubber would ever be of interest or importance in Germany except as a specialty product.

The butyl development was never a secret process, although of course the latest improvements are kept secret under Government order since the war. We had applied for patents throughout the world. And these patents, which

Digitized by Google

would have given all the essentials to I. G. or anyone else, were actually published in 1938.

Although we have spent money freely on butyl rubber development, neither the product nor the process was sufficiently advanced at the time of Pearl Harbor to be relied upon for anything more than a small proportion of the Government's rubber program. We were asked to produce annually a total of 60,000 tons of butyl rubber out of 800,000 tons total synthetic rubber production provided for.

CAPACITY INCREASED

There has been, however, continuous improvement both in the quality of butyl rubber and its manufacturing process. A few weeks ago we were able to announce that War Production Board had authorized us to change our plant designs to incorporate latest improvements which will result in raising the capacity of the butyl plants from 60,000 to 132,000 tons per annum without additional critical construction materials and with a saving in the cost of the product. We announced last March that we were entirely ready to license anyone to produce butyl rubber royalty-free for the period of the war, and at reasonable royalty rates after the war.

The witness said that there were only three technical men working on butyl rubber in May 1941. That number was mentioned in a Standard report as the number of those working on a particular phase of butyl. Our records show that throughout the year 1941 there were an average of 80.5 men working on butyl daily. If the witness had been a technically trained man he would have known that all the reports he read of May 1941 butyl work could not have come from only three men.

There has been a further recent development in butyl rubber which we call flexon. This will be made by many other people. Flexon is a somewhat inferior grade of butyl rubber which can be made with makeshift facilities, using dry ice as a refrigerant. It is hoped that a substantial quantity of this flexon can be produced in small plants at widely scattered points throughout the United States within a few months, thus tiding over the situation until the regular Government rubber program is in full operation late next year. Although we are necessarily pioneering the production of flexon, it is at present contemplated that we will make only a small proportion of the total output.

I have taken considerable time to review the history of our research relationship with I. G. and, in as few words as possible, to dispose of misrepresentations of our operations that have been made here. I would like to have leave from your committee to file an extension of my testimony when the whole record has been made available to us, in case it seems desirable to do so.

CONSENT DECREE

I have said that in the case of these 1929 contracts with I. G., we consulted the best legal opinion available. Opinion was unanimous that the contracts in no way violated antitrust laws.

Twelve years later the Antitrust Division took the position that some of those contracts did violate the antitrust law as it is now interpreted. They advised us that unless we were prepared to accept their views they would immediately file suit against us.

This country was then at war. Rather than enter upon a long legal contest with an arm of the Government in wartime, we decided to go without further argument the way the Antitrust Division wanted us to go. We signed a consent decree on March 25 of this year. In that consent decree we did not admit, nor were we asked to admit, that we had violated the antitrust law. We simply agreed that in the future we would, in respect of these contracts, follow the interpretations now being given by the Antitrust Division to this country's antitrust law.

Our idea in signing the consent decree was to have done with the matter. Apparently we were mistaken.

Like all other American businessmen, our primary concern right now is meeting the demand of war agencies for the production of miracles—demand for more and more production of better and better war weapons out of less and less plant equipment.

To save time, material, and lost motion in the production of war materials, the war agencies of our Government are urging the most complete technical cooperation on the part of industry. In buna rubber our company is in a pool

Digitized by Google

with the leading rubber companies; in butadiene manufacture we are in a pool of four chemical and four oil companies; in styrene manufacture we are in a pool of four chemical and two oil companies; in alkylation process for 100-octane gasoline we are in a pool of six companies; in catalytic cracking and in toluene production pools are just now being set up in more effective form through consultation with war agencies.

In conclusion, may I say this, Senator:

Since the days of the first Yankee clippers Americans have roamed the four corners of the earth, bringing back to this great country of ours new products, new materials, new ideas which American ingenuity has used to improve the standard of living of our people. We employees of the Standard Oil Co. are proud to be a part of that American tradition.

The question has been raised here as to whether American scientists have been less capable than German scientists. I do not want to leave that thought in the record. American scientists and technical men have proved that they are as smart as those of any country on the face of this globe. They were, in fact, smart enough, when the need arose in 1927, to take advantage of important contributions to science already made instead of wasting time by starting from scratch.

We, as a company, are proud of the wealth of technical knowledge we have brought into this country, and we are proud of what we have been able to do with this knowledge once we get it here. The whole American public has benefited in the many ways we have tried to show you here during the past 3 days.

We of the Standard Oil Co. are happy and proud that events have enabled us to make our country stronger and better equipped when our Nation needs the very best that every one of us has to give.

All of us have come down here because we felt that during these hearings our reputations, our motives, our integrity had been questioned. Others have read into cold legal documents motives which were not there. We have tried to tell you at first hand what our motives were. We have tried to show what we did for America with what we got from Germany, because what we intended to do can best be judged by the record of what we did.

I hope that we have set the record straight in your minds. We certainly have done our best to do so.

But there are more important considerations today even than the reputation of Standard Oil Co., no matter how important that may be to those of us who make up the company.

The only really important thing today is to win this war, and to win it in the quickest possible time. That is going to take every resource of all of us working together.

Hitler's slogan is "Divide and Conquer." To promote lack of harmony among his enemies is Hitler's game.

I do not want to leave this room without saying that our ambition is to work with you and with all other Americans to win this war. If you can show us how we can change what we are doing to help bring that about, we want your help. This war has not gone well for us to date. But united, we can win. United we will win. We of the Standard Oil Co. are 50,000 Americans. We are determined, as are you, to preserve for our children and our children's children those four freedoms which are dearer than life to all of us—the freedom of speech, the freedom of religious liberty, the freedom from want, the freedom from fear.

EXHIBIT 142

COMPARISON OF CERTAIN SENATE BILLS RELATING TO PATENTS

(1) S. 2491, Seventy-seventh Congress, second session, a bill to amend the patent laws, to prevent suppression of inventions, to promote the progress of science and the useful arts, and for other purposes. This bill, as well as S. 2303, discussed below, were the subject of extensive hearings before the Senate Committee on Patents in 1942. S. 2491 contains provisions which would have carried out a number of the proposals made in the final report and recommendations of the

Digitized by Google

Temporary National Economic Committee (S. Doc. No. 35, 77th Cong., 1st sess., pp. 36 and 37). The recommendations dealt with in the bill are as follows:

"(a) Licensing of patents: In order to eliminate the use of patents in ways inimical to the public policy inherent in the patent laws, as well as that of the antitrust laws, we recommend that the Congress enact legislation which will require that any future patent is to be available for use by anone who may desire its use and who is willing to pay a fair price for the privilege. Machinery, either judicial or administrative, should be set up to determine whether the royalty demanded by the patentee may fairly be said to represent reasonable compensation or is intended to set a prohibitive price for such use.

"This proposal is intended to prevent the suppression of patents as well as to provide for their availability for use in an equitable manner in any industry where they are a major factor."

[Approved. Dissenting: Sumners and Taylor.]

"(b) Unrestricted licenses: We recommend that the owner of any patent be required to grant only unrestricted licenses, and that he not be permitted to impose restrictions upon the buyer in sales of patented articles. In other words, the holder of a patent should not be permitted to restrict a licensee in respect of the amount of any article he may produce, the price at which he may sell, the purpose for which or the manner in which he may use the patent or any article produced thereunder, or the geographical area within which he may produce or sell such article. There should be a further prohibition against any other restriction which would tend substantially to lessen competition or to create a monopoly, unless such restriction is necessary to promote the progress of science and the useful arts."

[Approved without objection.]

"(c) Recording of transfers and agreements: We recommend that any sale, license, assignment, or other disposition of any patent be evidenced by an instrument in writing and that the same be required of any condition, agreement, or understanding relating to any sale or disposition of any such patent, and that in any such case a copy of such written instrument be filed with the Federal Trade Commission within 30 days after execution. There should, of course, be a substantial monetary penalty for failure to file as required."

[Approved without objection.]

* * * * * *

"(e) Forfeiture of patent for violation: If any person who owns any interest in or right under a patent violates any of the prohibitions described in paragraphs (a) and (b) above, his interest therein should be forfeited, such forfeiture to be brought about in a civil action against such person by the United States. Any patent or interest therein so forfeited should become a part of the public domain."

[Approved. Dissenting: Taylor.]

(2) S. 2303, Seventy-seventh Congress, second session, a bill to provide for the use of patents in the interest of national defense or the prosecution of war, and for other purposes. S. 2303 proposed to vest power during any war in the President to grant to any person a license to manufacture, use, or sell under any patent when such license would be in the interest of national defense or prosecution of war. Reasonable royalties, determined in accordance with regulations promulgated by the President, were to be paid under licenses so issued. The term of such license was also to be determined by the President. S. 2303 further proposed during time of war or declared emergency to vest in the President the power to acquire by purchase, donation, taking, or otherwise, patent rights where acquisition would be in the interest of national defense. Upon acquisition by taking, the owner of the patent rights was authorized to see compensation in the Court of Claims. The purpose of this bill has in part been met by the enactment of Public Law 768, Seventy-seventh Congress, an act to provide for adjusting royalties for the use of inventions for the benefit of the United States, in aid of the prosecution of the war, and for other purposes, which provides for the scaling down of excessive royalty charges to Government suppliers.

(3) S. 928, Seventy-seventh Congress, first session, a bill to establish a Circuit Court of Appeals for Patents. This bill was directed toward revision of the judicial machinery for adjudicating patent rights. Among other things, it deals with the problems arising from diversity of jurisdiction among United States courts over patent suits and the situation created by patents having a different

Digitized by Google

status in different circuits. The creation of such courts was recommended in the final report of the Temporary National Economic Committee, which stated (p. 37):

"(f) Single Court of Patent Appeals: In order to improve the existing mechanism for the issuance of patents and the determination of disputes relating thereto, we recommend the creation of a single Court of Patent Appeals with jurisdiction coextensive with the United States and its territories. Such a court would replace the present 11 different and independent jurisdictions and should do much to assure uniform treatment of patents and to reduce the time and cost of patent litigation."

(4) S. 4410, Seventy-sixth Congress, third session, a bill to protect the United States in respect of inventions usable for or against the national defense, and to protect against disclosures detrimental to the public interest of matters relating to the national defense. The purpose of this bill has been in part carried out by amendments to the patent laws providing for the issuance of secrecy orders for patents in connection with the promotion of the war effort.

S. 702, Seventy-eighth Congress, second session, introduced by Senator Kilgore, on February 11, 1943, is directed primarily toward the establishment of a unified administration to coordinate the development and utilization of the Nation's scientific and technical resources in furtherance of the war effort and the national welfare.

The Kilgore bill and the bills referred to by Senator Bone in his testimony would complement each other. Those referred to by Senator Bone deal with substantive problems in our patent system or with the judicial administration of patents, while the Kilgore bill relates to administration in promoting and developing research and the utilization of available or new techniques. The basic objectives of all these bills might be said to be the same, although each approaches the problem with different emphasis.

There might be minor features of various bills that should be clarified in connection with their possible interrelationship, but such clarification must await the final form of the various bills and will depend on the order in which legislation dealing with different phases of the patent system and the mobilization of scientific and technical resources, are enacted.

Let me say right here that our relations with I. G. have never constituted a cartel under either of these definitions.

The 1927 declaration of good faith from its origin had no possible purpose or effect except to record the good intentions of the parties under a simple oil patent contract applying to the United States only. The Antitrust Division represented it to the world as a separate pact made to coordinate the 1929 agreements—a pact by which Standard Oil and I. G. were to override all laws in effecting their purposes in the chemical field. It was not until a week or so ago that Mr. Gibson, of the Antitrust Division, publicly acknowledged that the "coordination agreement" of 1929 had, in fact, originated with the discussions of the first simple United States oil patent agreement.

A memorandum, made by I. G. in 1927 and taken from their files by the Antitrust Division in 1941, reported a discussion in which one of the I. G. officials somewhat extravagantly characterized this simple 1927 United States oil patent agreement, then under negotiation, as a "full marriage" between the parties. This statement was quoted and erroneously applied to the 1929 agreements as further proof of an alliance to rule the oil and chemical industries of the world.

Now I want you to bear this in mind in everything that follows. That quotation "full marriage" and that simple letter of good faith which was inflated into a significant "coordination agreement," were two of the foundations upon which they rested their jerry-built house.

CONTRACT INADEQUACIES

Just because it was so limited in its scope, the 1927 agreement was found to involve difficulties for both parties.

It did not prevent controversies over foreign rights to inventions resulting from the cooperation of both research staffs. There was still left the prospect of jealousies and disagreements which would tend to defeat honest technical cooperation in improving processes which both parties intended to license to the whole oil industry.

Also, the field of coal hydrogenation had been left completely outside of the agreement, even in the United States—because I. G. had valued this process so highly that it was unwilling to put it into the arrangement.

Standard Oil and I. G. were thus left in the anomalous position of cooperating to develop the oil hydrogenation process, at the same time not cooperating with one another in applying the results of their cooperation to the hydrogenation of coal, where much of the same improved techniques were useful.

I. G. also complained that it would be highly unfair if Standard were to take advantage of the new training in catalytic chemistry it was receiving from I. G. to embark in the purely chemical field by promptly applying this catalytic knowledge, for example, to the manufacture of dyes.

While Standard was quite willing to disclaim any intention of departing from the oil busines to enter the strictly chemical field, we had some small investments and some large ambitions in branches of the chemical business closely related to oil.

There was a further source of friction. Growing out of Germany's difficulty in paying for imports from foreign countries was the nationalistic urge to create synthetic oil from German coal. Although this meant loss of markets for our American oil, there was nothing we could do about it. What we thought we could do something about, however, was to protect the larget investment we had built up in German over the last 40 years. I. G., in marketing its synthetic oil, was ambitious to build up a duplicate distribution system for this new product paralleling the entirely adequate distribution system which Standard owned in Germany for handling its own imported gasoline. We hoped to persuade them that this was unnecessary and unsound.

A NEW CONTRACT

In 1929 therefore an effort was made to solve these problems by substituting for the original simple United States patent agreement of 1927 some arrangement which would be fair and workable on all matters which experience had shown must be provided for. By this time the technical departments of I. G. and Standard had been cooperating for 2 years. We had gained a wholesome respect for the research ability of their organization. We knew that we were just beginning to bring into this country most valuable knowledge on what catalytic chemistry could do in opening up new horizons for our whole oil industry.

Digitized by Google

Remember, 1929 was the year that the German Reichstag ratified the Kellogg Peace Pact.

The main agreement of 1929 was a simple purchase. Standard bought, for the world outside of Germany, full control of, and an 80-percent financial interest in, all of I. G.'s oil and coal hydrogenation processes, as well as their other inventions on oil refining. The 20-percent financial interest left with I. G. was for the purpose of keeping them active and interested in helping Standard with research to improve the processes.

I. G. refused to sell any of their patent rights for Germany, but a working arrangement between the two companies was arrived at under which Standard could continue, and expand, its regular oil refining business there and, in addition, handle on a profitable basis, through its local distributing organization, products made by I. G. in Germany from coal hydrogenation.

This straightforward purchase, widely hailed at the time in American newspapers, is the thing that is falsely labeled a world cartel for oil.

To give added color to this cartel picture they went to the length of quoting, as apparently having some pertinence, a provision which they found in an agreement between I. G. and the Shering Corporation (a company with which we have never had any relations of any kind) as follows:

"The existence, the content and the details of this agreement have to be kept secret by both parties notwithstanding the possible obligation of disclosing it to public officials."

This agreement we have never heard of, and we have always been at a loss to understand why it could have been considered either just or pertinent to inject an unverified and unexplained quotation of this kind from somebody else's records into an alleged exposition of our contract relations and policies. We are quite sure the members of this committee will agree with us that such procedure violates the rules of fair play.

How anyone could apply the term "cartel" to this 1929 purchase of German inventions is beyond our understanding. Our own views and intentions can best be judged by what we did. Even before we signed the contract we started to arrange for the sale of the oil and coal hydrogenation processes to the American oil industry at large through an industry company organized to take control—leaving us with only a minority stock interest and a right to future royalties.

We passed into the hands of the oil industry the control of, and responsibility for, new hydrogenation techniques which but for our purchase would certainly have been used by the German owners for their sole benefit. We were not trying to organize any cartels or to limit or prevent competition in the oil industry in any way. We are only a fraction of the world's oil industry, but we know that our own security rests on the general health and prosperity of that industry as a whole.

SUPPLEMENTARY AGREEMENTS

Supplementing the main agreement which dealt principally with hydrogenation processes, there were two other agreements, one relating wholly to Germany and the other to chemical processes. The agreement relating to Germany covered the sale by Standard of the gasoline made from coal in Germany and contained option provisions under which I. G. was to get rights to purchase shares in Standard's German subsidiary. It has never been able to exercise these options.

The difficulties which we had found to exist between us in the chemical field have already been referred to. The solution of these difficulties was attempted in a separate agreement, the provisions of which were as follows:

Each party confirmed the understanding of the other that it did not intend to depart from its existing policies to enter the industrial field of the other. I. G. was simultaneously selling to Standard all of its oil refining patents, and would therefore be handicapped if it tried to enter the oil business outside of Germany. There was therefore all the more reason why it should ask us to stipulate that we did not intend to depart from our own line of business, take advantage of the education in catalytic chemistry received from I. G. and attempt to set ourselves up in the general chemical business.

While these expressions of policy and intent were made in good faith, there was no actual prohibition against either party buying control of, or starting a company competing with the other anywhere in the world. The actual effect on their future operations was only the effect resulting from the sale of new developments to each other. In Standard's case, this was an agreement to sell to I. G. control of any new chemical development not closely related to Standard's

Digitized by Google

then existing business. There was a corresponding agreement by I. G. to sell to Standard control of any new chemical development so closely related to the oil business that it could only be carried on effectively as a part of the oil business. This still left to be settled new chemical developments which would be related to the then existing business of Standard (as for example, by the use of natural gas or petroleum products as raw materials) but which were not so closely related to the oil business as to be incapable of growth as independent enterprises.

I. G. agreed to offer to Standard a substantial but not controlling participation in any such new developments originating with them. The terms upon which I. G. would actually offer such participation, and the extent of such participation, were left entirely open.

Standard itself assumed no corresponding obligation. We were therefore in the position of having obtained a broad general option for a minority participation in I. G. oil chemical processes—even though they could be developed entirely independently of the oil business—while still retaining our own control over our own oil chemical processes of a similar character.

Without knowing the details, we knew that I. G. had gone very far in the development of several important processes for the production of chemical products from oil raw material. We knew that they were about ready to commercialize manufacture of fertilizers from natural gas, that they had processes for making acetylene from refinery gas, that they could make some kind of synthetic rubber from this acetylene, and that they were also working on the production of soap from paraffin wax. We were well satisfied, therefore, that our option would be of some interest and value to us in the future. And remember, the only thing we gave for it was a promise that we would not do something we had not done for 50 years and had no intention of doing in the future; that was, to make a sudden jump completely outside of the oil business and start ourselves up in the general chemical business.

This agreement which I have just described to you is the Antitrust Division's imaginary chemical cartel. It is the foundation of the claim that we violated the antitrust laws of the United States. We were absolutely sure that the agreement was proper and constructive, that it would advance the interests of our Nation, the American oil industry, and our company. We were advised by the most competent counsel that it constituted no violation of the antitrust laws.

A COOPERATIVE RESEARCH COMPANY

As I told you, the 1929 agreements gave us a general option to acquire an interest in oil-chemical developments of I. G. But the general option necessarily left unstated the terms on which any particular interest in any particular invention would be offered. It was therefore "an agreement to agree" rather than a final contract.

Actually we did not know at that time exactly what oil-chemical developments I. G. had or how valuable they might be. After the 1929 agreement was signed they gave us more specific information both on what they were doing and on what they hoped to do in this field of converting oil raw material into chemical products—soap, acetylene, and rubber.

After a year of study and talk we made another step forward. We worked out the Joint American Study Co. agreement, which was, with slight variation, a method of implementing the general option which we had obtained in 1929. It was agreed that we would organize an American corporation, the Joint American Study Co., afterward abbreviated to Jasco, in which the two companies would be equal partners. This company was the vehicle through which there were to be developed and licensed the processes of making chemical products from oil raw material.

The arrangement had one extremely significant provision, however. This was that neither party was obligated to put into Jasco any development, no matter what its nature, in a business in which he was already engaged. The whole thing was therefore limited in its scope to brand-new developments not yet commercialized by either party. This relieved Standard of all obligations to I. G. on the only lines of oil-chemical work on which it had any existing assets or prospects—the manufacture of alcohols and similar chemical solvents from oil and the manufacture of antiknock compounds for gasoline. In 1929 we had invested in these oil-chemical fields about $3,000,000, and we expected this business to grow. It has grown. Our investments have increased from about $3,000,000 to about $30,000,000.

Digitized by Google

As a result of this provision, I. G. was obligated to put into the new joint company many processes not yet commercially used, but upon which it had spent great sums of money—such as the acetylene process, the soap process, and the buna rubber process. On the other hand, Standard had no counterrailing asets to offer.

THE REAL EFFECT

This inequity was met by adhering to the 50–50 ownership, but adding the provision that the party originating any process should receive five-eighths of the financial return on that process, and the other party only a three-eighths interest. It was natural that the majority interest should have the deciding voice on development and licensing.

In the practical operation of Jasco, therefore, the parties adopted the natural rule that the one originating a particular process should also have control of it.

The Jasco arrangement had the effect, therefore, of giving to Standard a three-eighths interest in some new oil-chemical processes in return for simply putting up one-half of the money used in their commercial development, and the development itself was to be done in the United States.

Standard was then a novice in this field. It had its education still to get. It had at the time no processes to contribute and, as a matter of fact, never contributed any during the 10 years of this arrangement. But if it had ever had any such process to contribute it would have given up only a three-eighths interest and retained control.

BUTYL BELONGS TO AMERICA

Mr. Gibson told you that we would not have had control of butyl rubber, even though we would have had a five-eighths financial interest in it. He is entirely wrong. Butyl rubber has not been and cannot be, made on a large scale except as part of an oil business, and therefore control automatically remained with us under the 1929 agreement. The 1930 agreement only confirmed this situation, since under it the parties soon adopted the sensible working rule that the originator should have control.

The butyl rubber process of course came within the terms of the Jasco arrangement and would have eventually come into Jasco if the war had not intervened. If so it would have been a partial offset to the buna and other processes which I. G. had put in. As a matter of fact, the war did intervene and the entire arrangement was recast into a geograpical division rather than a partnership of the parties throughout the world, so that I. G. never even acquired a minority interest in butyl rubber in the United States, where its principal value will certainly always lie.

SUMMARY OF CONTRACTS WITH I. G. F.

The net result therefore of the so-called chemical cartel created by the 1929 general option agreement and the 1930 agreement implementing this general option was that Standard acquired a minority interest in a group of oil-chemical processes which I. G. had developed and owned and would have continued to own exclusively except for this arrangement. Standard gave in return an agreement to sell to I. G. at a price to be determined at the time, control of chemical inventions entirely outside the oil industry, none of which inventions of any consequence Standard had made before or has made since. In addition we agreed to give a minority interest in Standard inventions in the oil-chemical field, outside of the lines in which Standard might be engaged at the time. Although Standard's oil-chemical business actually expanded tenfold between 1929 and 1941, this expansion was in fields outside of the I. G. contract, and the first process of Standard's within the scope of this alleged world chemical cartel was the butyl process, which will become a commercial reality in the United States for the first time this December, 3 years after the Jasco contract was completely revised to eliminate all interest of I. G. in the United States patents coming under the contract.

SYNTHETIC ACETIC ACID

Now let me take up specifically some of the statements of witnesses who have attacked us here before you.

Mr. Irving Lipkowitz, an economic expert in the Antitrust Division, took more than a day of the time of this committee painting a distorted picture of our op-

Digitized by Google

erations with acetic acid, acetylene, and acetaldehyde. His own summary of this story was this:

"During the early 1930's I. G. Farben of Germany held the United States patents on a new and promising process for making acetylene, the principal material used in the manufacture of synthetic acetic acid. By an adroit manipulation of these patents, and by a clever use of its partnership with Standard Oil of New Jersey, I. G. Farben succeeded in preventing the full development and utilization of that process."

As Mr. Lipkowitz says, I. G. owned the process and the patents on it granted to them by our Government. When we signed our contract with I. G. covering this process they became obligated to put up some money with us for experiments to see what could be done with it. Those experiments cost $1,500,000, half of which I. G. had to put up. Out of those experiments we hoped to find a missing link in the synthetic rubber chain (cheap acetaldehyde), and incidentally to recover the cost of the work by selling any acetic acid we produced.

Now, gentlemen, if I. G. had wanted to prevent the development and utilization of this process, all they had to do, obviously, was not to sign such a contract with us. It was the contract which started something—not stopped something. Let's put it in the simplest terms. I. G. owned a mining claim. They gave us a share of the claim on condition that we put up some money jointly with them to sink a shaft and see if we could get any ore out of the mine.

This the witness called a deep-dye plot of I. G. to stifle the production of ore.

I may add, gentlemen, that after spending $1,500,000 we found out that the mine was worthless. We were never able to produce either acetylene or acetic acid by these methods on a commercially attractive basis, although we often thought we were just on the point of doing so. Nor were we ever able to persuade anyone to buy a license for the process, although we peddled the process industriously in an effort to get our money back that way.

The experiments on this process were conducted in the United States over the period 1931 to 1935. When these experiments were started, we had at Baton Rouge, La., power costing approximately 2 mills per kilowatt-hour. We also had a special cut of refinery gas from which the acetylene could be made with less power requirements than from any other cut. However, by 1935 our cost of available power at Baton Rouge had increased to about 4 mills per kilowatt-hour and shortly thereafter we were using the special cut of refinery gas for making another chemical product, ethyl chloride, needed in our business. As a result of these two factors, the cost of power for this process for producing acetylene from refinery gas was increased by about 120 percent. This was primarily an electrical process so that the cost of power was a controlling factor. Without cheap power and cheap gas it offered no attraction for us or anyone else.

So far as we are concerned, the most important outcome of the whole thing is that we satisfied ourselves that this process, which was the original I. G. scheme for making rubber from oil, was not going to work in the United States.

You gentlemen know the patent laws of this country. If the inventor wants to he can sit still for 17 years with his patent and not use it himself or let anyone else use it. You have often considered whether this phase of the law should be amended, and so far you have always decided that it shouldn't. Our contract forced I. G. to do something with a patent which they could otherwise have continued to let rest in peace. Since they had owned the patent in the first place, they still retained the deciding voice on just what was to be done with it, but after they signed up with us they had to do something, and in all fairness to them, they did—they spent their half of $1,500,000 and they taught us a lot of things.

The witness also drew the fanciful conclusion that we started to tear down the pilot plant used in this work on orders from Germany when Germany went to war in September 1939. The fact of the matter is that by the end of 1937 we had virtually abandoned experimenting in the production of acetylene and acetic acid and beginning in 1936 parts of the pilot plant were taken for use in the ethyl chloride plant, since that was a more promising experiment. In May of 1939 our own people at the Baton Rouge plant suggested that instead of spending more money for maintenance we should dismantle the plant and salvage whatever we could. Acting upon our own suggestion, several months before Germany went to war, steps were taken to carry out this decision by listing all equipment for sale or transfer and arranging to dismantle the outside structures which could not be used for any other purpose.

Thus there is no support in fact for the long and fanciful tale of the witness in respect to the acetylene and acetic acid venture.

PARAFLOW

Mr. John R. Jacobs, also a special attorney in the Antitrust Division, took a day of your time to present to you his picture of the injury to American interests which he says resulted from our handling of two inventions—called Paraflow and methane steam.

That witness summarized his testimony as follows:

"My testimony before this committee will be limited to a discussion of a product called paraflow and the methane steam process, both of which were directly affected by the cartel arrangement of 1929 between Standard Oil of New Jersey and the I. G. Farbenindustrie of Germany. The formation of this cartel between these two industrial empires operated, as to paraflow, to create a complete monopoly and give to I. G. royalties which should have gone to American industry. As to the methane steam process, the effect was to restrain its use and thus to prevent our strategic explosives industry from obtaining necessary licenses under the patents to increase our war production."

Let me dispose of that, also, in a few words.

A CHEMICAL CURIOSITY

I. G. had discovered how to make a very expensive synthetic lubricating oil which was to them only a curiosity and for which they had no practical use. One of our chemists, who had been searching for years for something to put into the highest grade Pennsylvania automobile oils to keep them from freezing in cold weather, picked up a laboratory sample of this German chemical curiosity on a visit to their laboratories, brought the formula home, and found it was exactly what he was seeking. He patented the process for freeze-proofing Pennsylvania type oils by adding a small quantity of product of the chemical nature of this German synthetic oil. But the only way we could make any such product practically was to get a license from the Germans to manufacture their chemical curiosity in America. We were entitled to do this under our 1929 agreements, but we had to pay a small supplementary amount to I. G.—as provided for in the same agreement.

The actual amount paid them was 3½ percent of the profits of the business. This is the basis for the witness' statement that we "gave to I. G. royalties that should have gone to American industry."

The entire paraflow business, which turned out to be a profitable one and some consolation to us for our share of the $1,500,000 we had just dropped in the "worthless mine" I told you about, could never have been started if the I. G. organic chemists had not discovered this chemical curiosity and handed us a sample to play with.

Now as to the monopoly business. We never had any monopoly on paraflow except the 17-year monopoly the patents gave us, and that is what Government patents are for. Other companies started manufacturing freeze-proofed oils that infringed our patents or conflicted with our pending applications. In order to avoid extended controversy and litigation over patents with respect to these conflicts, we settled the controversies by acquiring the conflicting rights or granting limited licenses under our patents, in each case without interfering with the use by the other parties of their products in the sale of their oils.

The truth of the matter is that no one has yet succeeded in getting up a competing product which does not depend on our patents and which is of good enough quality to take any large amount of the paraflow business.

Whatever monopoly we have enjoyed has been due to the merits of the invention and of the product.

Trade statistics show that there has been a reduction in wholesale price in these freeze-proof oils of about 2½ cents a gallon, which has resulted from the general use of paraflow in place of the more costly methods previously used to make an oil of inferior all-around quality. We have been fortunate enough to make a profit out of this invention. The public has gotten better automobile oils at lower prices.

METHANE STEAM PROCESS

In their study of the manufacture of synthetic ammonia, which is one of their main lines of business, the I. G. had invented a process for producing hydrogen from methane and steam. This also seemed to be the best process for getting the hydrogen needed for oil hydrogenation. So when we bought the hydrogenation rights we took the rights to this methane steam process, but only for hydro-

Digitized by Google

genation, not for synthetic ammonia. We have never been in the synthetic ammonia business, but we developed the methane steam process here in America on a large scale in connection with our oil hydrogenation. We improved on it and got som patents of our own on the improvements. We gave our designs to several large refiners and some of the best engineering contractors—always with the understanding that the rights we gave them under any patents of I. G. were limited entirely to hydrogenation of oil and coal.

When the national defense program had gotten under way here there was need for new synthetic ammonia plants. Some of the contractors who were negotiating for these new ammonia plants wanted to use the methane steam plant designs which they had gotten from us for use in oil hydrogenation. Germany was, of course, already at war. Efforts by the contractors and by us to get any action out of the I. G. in Germany on patent licenses for these synthetic ammonia plants proved fruitless. We therefore took it upon ourselves to see that the Government was advised, knowing that they had full power to cut this legal Gordian knot—the only thing that stood in the way of using the underlying German inventions for producing the hydrogen for synthetic ammonia.

CUTTING THE GORDIAN KNOT

Our procedure was to write the engineering contractors, explaining exactly what the situation was, then take the letters down to Washington and review the problem with the Office of Production Management, the war agency handling the matter. Our files show that this conference took place on August 25, 1941, with Dr. Reed, head of the Chemical Division, and Mr. Eaton, Associate General Counsel of Office of Production Management. The Office of Production Management Officials took all necessary action to deal with this matter. Since it is of interest I will pass on to you statements, which I believe to be reliable, that six large ammonia plants, built under Government sponsorship and making about one-half of all the emergency ammonia to be produced in connection with the war effort, are using this process. The engineers estimate the savings of money and proportionate savings of steel and other critical materials from the use of this process to be somewhere between twenty and forty million dollars as compared with the next best process. I should explain to you that the ammonia made for war purposes goes into explosives.

The witness's summary of the methane steam matter was: "As to the methane steam process, the effect (of our contracts with I. G.) was to restrain its use and thus to prevent our strategic explosives industry from obtaining necessary licenses under the patents to increase our war production."

On the contrary, the effect was to give to this country, in advance of the war, all the knowledge and plant designs necessary to go ahead with the best process for synthetic ammonia whenever the need arose, so that by a simple act of a war agency al lof the patent complications, assumed by the witness to have been sufficient to hamstring the United States Government, were swept away.

SYNTHETIC RUBBER

On May 20, 21, and 22, 1942, Mr. Robert M. Hunter, a Special Assistant to the Attorney General, presented to your committee his interpretation of 230 documents having to do with synthetic rubber. When these 230 documents are considered on their own merits, apart from the interpretation of the witness, they show a record of which we are proud.

That witness, in introducing himself to you, confessed that his knowledge of these matters had come almost exclusively from such files of the Standard Oil Co. as he had been able to examine and that he might "have distorted the picture of some matters widely as a result of the limited horizon" he had. He admitted also that he "had no chemical background," and that he did not "hold himself out as an expert on synthetic rubber, either as to the chemistry of it or any other phase of it."

The synthetic-rubber problem is inherently one of the most complicated chemical and industrial problems this country has ever had to face. Many competent men have given the Congress and the public honest and correct appraisals of the difficulties that had to be met but in my opinion these difficulties have been enormously aggravated by the widely publicized statements of a number of fake experts and notoriety seekers who didn't know what they were talking about. Unfortunately, most of them have lacked the frankness of Mr. Hunter in ad-

Digitized by Google

mitting their inadequacies. The fact remains, however, that the American public has been confused by what they have said.

I shall try to tell you the plain facts about this matter so far as our company is concerned in terms of plain common sense and without technical detail.

ORIGIN OF BUNA

The German I. G. developed a product called Buna rubber, which they made from coal. Under our 1929 and 1930 agreement we were entitled to a three-eighths interest in Buna rubber outside Germany, but only to the extent that it was made from oil or natural gas. The German Government subsidized the work in Germany on producing buna from coal, beginning sometime around 1935 or 1936, and at the outbreak of the war in September 1939 they had just gotten into operation their first large-scale commercial plant of 25,000 tons capacity, which was probably about one-tenth of their war requirements.

There was at that time no commercial production of buna rubber in the United States, but there had been nearly 10 years of study of the problem of producing buna from oil by us here and we had had considerable help from the I. G. The bottleneck was how to get butadiene cheaply enough and in large quantities. I told you that our company and I. G. spent a million and a half dollars between 1931 and 1935 on a process which was supposed to provide the missing link but which turned out to be much too expensive.

Both I. G. and Standard had tried out several other methods of producing butadiene from oil on a small scale and we knew they would work. We also knew that buna rubber itself had been developed into a fairly good product—good enough to be reliable as a tire rubber in case of necessity. There was also a good prospect for a small commercial business making special high-cost grades of buna rubber for special purposes. At the end of 1938 I. G. and Standard were conducting initial conversations with the leading rubber companies in the United States on the merits of the buna rubber process and product.

FIRST AMERICAN BUNA TIRES

During 1939—at the very time when Hitler must have had his war all planned—five leading rubber companies in this country were running tests on buna rubber tires, using product which I. G. had supplied them at our request. Actual manufacture of the tires was carried out with the help of an expert sent from I. G. for the purpose.

At the time the war broke out in Europe what was wrong with this picture? Only one thing—that is, the process still belonged to the Germans, and we had only a minority interest.

Our solution of this situation was to eliminate I. G.'s interest in the buna process in the United States completely. We proceeded at once. Before the end of September 1939, an agreement had been worked out under which we were to take over all of the rights in the buna rubber process for the United States and the British and French Empires, and give up all our rights for the rest of the world. Within 1 month after Europe went to war, and more than 2 years before America went to war, we had eliminated all foreign interest in this process and were free to do with it whatever seemed necessary.

In 1939 almost everybody in this country, including our national leaders, hoped and believed that we could keep from being drawn into war with anyone. But if we had been gifted with foresight, if we had known that we would be at war with Germany in 1942, we could have taken no wiser step.

MUNITIONS BOARD GETS DATA

What did we do with buna rubber when we had eliminated foreign control? We did three things: First, we reported the situation to the Army and Navy Munitions Board in November 1939 and asked for advice. From that time to this we have been constantly in contact with all appropriate agencies of our Government and followed the advice they gave us. The first advice given to us by the Army and Navy Munitions Board was to try to interest the rubber companies in some sort of common effort to develop buna rubber in the United States, in the belief that such concerted effort would afford the best foundation for the necessary Government assistance in developing the new industry as a safeguard in case of emergency. We made plans to pool our interests with

Digitized by Google

the rubber companies as suggested by the Army and Navy Munitions Board, but the plans were not approved by legal counsel.

The second thing we did was to begin at once our own plans for buna rubber production in the United States. We had the advantage of a 10-year background of study of butadiene production, which was the real problem. Actual production of the rubber was relatively simple. By the time America went into the war we were in commercial production of buna rubber and had nearly finished our first oil butadiene plant, which was designed for about 10 tons a day. This gave us a production which exceeded our ability to sell the product at that time.

The third thing we did was to offer licenses to all the rubber companies we thought would be interested in producing buna rubber. Two out of the four largest companies, Firestone and United States Rubber Co., accepted these licenses promptly, and Firestone began commercial production. The other two companies who were interested in synthetic rubber, Goodyear and Goodrich, preferred to continue to develop their own processes, which though very similar to the buna process, were not, in their opinion, under the buna patents.

In the 2½ years prior to Pearl Harbor, our company submitted on 46 occasions samples of various synthetic rubbers to 7 different Government agencies or their appointed representatives.

It was not until the middle of 1941 that the Government itself undertook to do anything definite about buna rubber production. We gave Government agencies all possible assistance and never suggested that our company should have any preferential position in the Government's manufacturing program.

PEARL HARBOR

With the outbreak of war in the Pacific, the Government acted promptly to greatly expand its rubber program. To expedite this, it wanted to get a complete pool of all patents and all information which anyone had on buna rubber. The pool was formed within 2 weeks after Pearl Harbor. We threw in all of our improvement patents, as did other parties, without royalty. A royalty of 1 percent was allowed us for the basic patents for the period of the emergency, rising to 2 percent after the emergency. Again there was no question of preference of any kind to our company in the actual manufacture of the rubber or in any of the raw materials for it.

As you all know, the buna rubber program is the foundation of the entire synthetic rubber program of the Government. They expect to make, as far as we know now, 700,000 tons a year of buna rubber. In this program we agreed to supply 7,000 tons of butadiene from a plant that we already had under construction, financed with our own money, before Pearl Harbor, and 45,000 tons from two plants we are building for the Government. We offered to make raw materials. At one time, impatient for quick action from other companies, the Government asked us to assume larger commitments for butadiene. This we were willing to do, but these additional commitments were very soon undertaken by others.

While we ourselves are making only a small percentage of butadiene for the Government's program and absolutely none of the buna rubber itself in this program, plant designs and detailed processes for buna rubber and for butadiene manufacture based on our engineering are being used widely throughout the rubber and oil industries under the information and patent pools which the Government initiated with the approval of the Attorney General.

BUTYL RUBBER

To complete the rubber picture I want to comment only on one more thing—butyl rubber. Our chemists first hit on this product in 1937 as an outgrowth of their work on a somewhat similar product, vistanex, a rubberlike substance which we had obtained from I. G. In 1937 and 1938 we filed patent applications for this butyl rubber in the United States and many other countries and at the same time reported it to I. G. as a development which would come under our contracts. We did not think at the time, and we have never had any reason to think since, that butyl rubber would ever be of interest or importance in Germany except as a specialty product.

The butyl development was never a secret process, although of course the latest improvements are kept secret under Government order since the war. We had applied for patents throughout the world. And these patents, which

Digitized by Google

would have given all the essentials to I. G. or anyone else, were actually published in 1938.

Although we have spent money freely on butyl rubber development, neither the product nor the process was sufficiently advanced at the time of Pearl Harbor to be relied upon for anything more than a small proportion of the Government's rubber program. We were asked to produce annually a total of 60,000 tons of butyl rubber out of 800,000 tons total synthetic rubber production provided for.

CAPACITY INCREASED

There has been, however, continuous improvement both in the quality of butyl rubber and its manufacturing process. A few weeks ago we were able to announce that War Production Board had authorized us to change our plant designs to incorporate latest improvements which will result in raising the capacity of the butyl plants from 60,000 to 132,000 tons per annum without additional critical construction materials and with a saving in the cost of the product. We announced last March that we were entirely ready to license anyone to produce butyl rubber royalty-free for the period of the war, and at reasonable royalty rates after the war.

The witness said that there were only three technical men working on butyl rubber in May 1941. That number was mentioned in a Standard report as the number of those working on a particular phase of butyl. Our records show that throughout the year 1941 there were an average of 80.5 men working on butyl daily. If the witness had been a technically trained man he would have known that all the reports he read of May 1941 butyl work could not have come from only three men.

There has been a further recent development in butyl rubber which we call flexon. This will be made by many other people. Flexon is a somewhat inferior grade of butyl rubber which can be made with makeshift facilities, using dry ice as a refrigerant. It is hoped that a substantial quantity of this flexon can be produced in small plants at widely scattered points throughout the United States within a few months, thus tiding over the situation until the regular Government rubber program is in full operation late next year. Although we are necessarily pioneering the production of flexon, it is at present contemplated that we will make only a small proportion of the total output.

I have taken considerable time to review the history of our research relationship with I. G. and, in as few words as possible, to dispose of misrepresentations of our operations that have been made here. I would like to have leave from your committee to file an extension of my testimony when the whole record has been made available to us, in case it seems desirable to do so.

CONSENT DECREE

I have said that in the case of these 1929 contracts with I. G., we consulted the best legal opinion available. Opinion was unanimous that the contracts in no way violated antitrust laws.

Twelve years later the Antitrust Division took the position that some of those contracts did violate the antitrust law as it is now interpreted. They advised us that unless we were prepared to accept their views they would immediately file suit against us.

This country was then at war. Rather than enter upon a long legal contest with an arm of the Government in wartime, we decided to go without further argument the way the Antitrust Division wanted us to go. We signed a consent decree on March 25 of this year. In that consent decree we did not admit, nor were we asked to admit, that we had violated the antitrust law. We simply agreed that in the future we would, in respect of these contracts, follow the interpretations now being given by the Antitrust Division to this country's antitrust law.

Our idea in signing the consent decree was to have done with the matter. Apparently we were mistaken.

Like all other American businessmen, our primary concern right now is meeting the demand of war agencies for the production of miracles—demand for more and more production of better and better war weapons out of less and less plant equipment.

To save time, material, and lost motion in the production of war materials, the war agencies of our Government are urging the most complete technical cooperation on the part of industry. In buna rubber our company is in a pool

Digitized by Google

with the leading rubber companies; in butadiene manufacture we are in a pool of four chemical and four oil companies; in styrene manufacture we are in a pool of four chemical and two oil companies; in alkylation process for 100-octane gasoline we are in a pool of six companies; in catalytic cracking and in toluene production pools are just now being set up in more effective form through consultation with war agencies.

In conclusion, may I say this, Senator:

Since the days of the first Yankee clippers Americans have roamed the four corners of the earth, bringing back to this great country of ours new products, new materials, new ideas which American ingenuity has used to improve the standard of living of our people. We employees of the Standard Oil Co. are proud to be a part of that American tradition.

The question has been raised here as to whether American scientists have been less capable than German scientists. I do not want to leave that thought in the record. American scientists and technical men have proved that they are as smart as those of any country on the face of this globe. They were, in fact, smart enough, when the need arose in 1927, to take advantage of important contributions to science already made instead of wasting time by starting from scratch.

We, as a company, are proud of the wealth of technical knowledge we have brought into this country, and we are proud of what we have been able to do with this knowledge once we get it here. The whole American public has benefited in the many ways we have tried to show you here during the past 3 days.

We of the Standard Oil Co. are happy and proud that events have enabled us to make our country stronger and better equipped when our Nation needs the very best that every one of us has to give.

All of us have come down here because we felt that during these hearings our reputations, our motives, our integrity had been questioned. Others have read into cold legal documents motives which were not there. We have tried to tell you at first hand what our motives were. We have tried to show what we did for America with what we got from Germany, because what we intended to do can best be judged by the record of what we did.

I hope that we have set the record straight in your minds. We certainly have done our best to do so.

But there are more important considerations today even than the reputation of Standard Oil Co., no matter how important that may be to those of us who make up the company.

The only really important thing today is to win this war, and to win it in the quickest possible time. That is going to take every resource of all of us working together.

Hitler's slogan is "Divide and Conquer." To promote lack of harmony among his enemies is Hitler's game.

I do not want to leave this room without saying that our ambition is to work with you and with all other Americans to win this war. If you can show us how we can change what we are doing to help bring that about, we want your help. This war has not gone well for us to date. But united, we can win. United we will win. We of the Standard Oil Co. are 50,000 Americans. We are determined, as are you, to preserve for our children and our children's children those four freedoms which are dearer than life to all of us—the freedom of speech, the freedom of religious liberty, the freedom from want, the freedom from fear.

EXHIBIT 142

COMPARISON OF CERTAIN SENATE BILLS RELATING TO PATENTS

(1) S. 2491, Seventy-seventh Congress, second session, a bill to amend the patent laws, to prevent suppression of inventions, to promote the progress of science and the useful arts, and for other purposes. This bill, as well as S. 2303, discussed below, were the subject of extensive hearings before the Senate Committee on Patents in 1942. S. 2491 contains provisions which would have carried out a number of the proposals made in the final report and recommendations of the

Digitized by Google

Temporary National Economic Committee (S. Doc. No. 35, 77th Cong., 1st sess., pp. 36 and 37). The recommendations dealt with in the bill are as follows:

"(a) Licensing of patents: In order to eliminate the use of patents in ways inimical to the public policy inherent in the patent laws, as well as that of the antitrust laws, we recommend that the Congress enact legislation which will require that any future patent is to be available for use by anone who may desire its use and who is willing to pay a fair price for the privilege. Machinery, either judicial or administrative, should be set up to determine whether the royalty demanded by the patentee may fairly be said to represent reasonable compensation or is intended to set a prohibitive price for such use.

"This proposal is intended to prevent the suppression of patents as well as to provide for their availability for use in an equitable manner in any industry where they are a major factor."

[Approved. Dissenting: Sumners and Taylor.]

"(b) Unrestricted licenses: We recommend that the owner of any patent be required to grant only unrestricted licenses, and that he not be permitted to impose restrictions upon the buyer in sales of patented articles. In other words, the holder of a patent should not be permitted to restrict a licensee in respect of the amount of any article he may produce, the price at which he may sell, the purpose for which or the manner in which he may use the patent or any article produced thereunder, or the geographical area within which he may produce or sell such article. There should be a further prohibition against any other restriction which would tend substantially to lessen competition or to create a monopoly, unless such restriction is necessary to promote the progress of science and the useful arts."

[Approved without objection.]

"(c) Recording of transfers and agreements: We recommend that any sale, license, assignment, or other disposition of any patent be evidenced by an instrument in writing and that the same be required of any condition, agreement, or understanding relating to any sale or disposition of any such patent, and that in any such case a copy of such written instrument be filed with the Federal Trade Commission within 30 days after execution. There should, of course, be a substantial monetary penalty for failure to file as required."

[Approved without objection.]

* * * * * *

"(e) Forfeiture of patent for violation: If any person who owns any interest in or right under a patent violates any of the prohibitions described in paragraphs (a) and (b) above, his interest therein should be forfeited, such forfeiture to be brought about in a civil action against such person by the United States. Any patent or interest therein so forfeited should become a part of the public domain."

[Approved. Dissenting: Taylor.]

(2) S. 2303, Seventy-seventh Congress, second session, a bill to provide for the use of patents in the interest of national defense or the prosecution of war, and for other purposes. S. 2303 proposed to vest power during any war in the President to grant to any person a license to manufacture, use, or sell under any patent when such license would be in the interest of national defense or prosecution of war. Reasonable royalties, determined in accordance with regulations promulgated by the President, were to be paid under licenses so issued. The term of such license was also to be determined by the President. S. 2303 further proposed during time of war or declared emergency to vest in the President the power to acquire by purchase, donation, taking, or otherwise, patent rights where acquisition would be in the interest of national defense. Upon acquisition by taking, the owner of the patent rights was authorized to see compensation in the Court of Claims. The purpose of this bill has in part been met by the enactment of Public Law 768, Seventy-seventh Congress, an act to provide for adjusting royalties for the use of inventions for the benefit of the United States, in aid of the prosecution of the war, and for other purposes, which provides for the scaling down of excessive royalty charges to Government suppliers.

(3) S. 928, Seventy-seventh Congress, first session, a bill to establish a Circuit Court of Appeals for Patents. This bill was directed toward revision of the judicial machinery for adjudicating patent rights. Among other things, it deals with the problems arising from diversity of jurisdiction among United States courts over patent suits and the situation created by patents having a different

Digitized by Google

status in different circuits. The creation of such courts was recommended in the final report of the Temporary National Economic Committee, which stated (p. 37):

"(f) Single Court of Patent Appeals: In order to improve the existing mechanism for the issuance of patents and the determination of disputes relating thereto, we recommend the creation of a single Court of Patent Appeals with jurisdiction coextensive with the United States and its territories. Such a court would replace the present 11 different and independent jurisdictions and should do much to assure uniform treatment of patents and to reduce the time and cost of patent litigation."

(4) S. 4410, Seventy-sixth Congress, third session, a bill to protect the United States in respect of inventions usable for or against the national defense, and to protect against disclosures detrimental to the public interest of matters relating to the national defense. The purpose of this bill has been in part carried out by amendments to the patent laws providing for the issuance of secrecy orders for patents in connection with the promotion of the war effort.

S. 702, Seventy-eighth Congress, second session, introduced by Senator Kilgore, on February 11, 1943, is directed primarily toward the establishment of a unified administration to coordinate the development and utilization of the Nation's scientific and technical resources in furtherance of the war effort and the national welfare.

The Kilgore bill and the bills referred to by Senator Bone in his testimony would complement each other. Those referred to by Senator Bone deal with substantive problems in our patent system or with the judicial administration of patents, while the Kilgore bill relates to administration in promoting and developing research and the utilization of available or new techniques. The basic objectives of all these bills might be said to be the same, although each approaches the problem with different emphasis.

There might be minor features of various bills that should be clarified in connection with their possible interrelationship, but such clarification must await the final form of the various bills and will depend on the order in which legislation dealing with different phases of the patent system and the mobilization of scientific and technical resources, are enacted.

SCIENTIFIC AND TECHNICAL MOBILIZATION

THURSDAY, OCTOBER 14, 1943

UNITED STATES SENATE,
COMMITTEE ON MILITARY AFFAIRS,
SUBCOMMITTEE ON WAR MOBILIZATION,
Washington, D. C.

The subcommittee on war mobilization met at 10:30 a. m., pursuant to call of the chairman, Senator Harley M. Kilgore, West Virginia, presiding.

Present: Senator Harley M. Kilgore, West Virginia.

Also present: Herbert Schimmel, chief investigator.

The CHAIRMAN. The committee will come to order. We are reopening the hearings on Senate bill No. 702, the technical mobilization bill, The first witness, and the only witness today, will be the Vice President of the United States, the Honorable Henry A. Wallace.

Mr. Wallace, I wish you would go ahead in your own way and give us the results of your experience and investigation with reference to mobilization, cartels, patents, and anything pertaining to development of scientific research and its proper use in the United States and abroad.

STATEMENT OF THE HONORABLE HENRY A. WALLACE, VICE PRESIDENT OF THE UNITED STATES

Mr. WALLACE. Senator, my own personal experience has been largely based on my observation of the scientific work in the Department of Agriculture.

The CHAIRMAN. Well, Mr. Vice President, a study of this bill, I believe, would convince almost anybody that it is a bill to give to industry and business the same advantage that the Department of Agriculture has been endeavoring to give to the farmer of the United States.

Mr. WALLACE. That is why I am so much interested in the bill.

I welcome this opportunity to support your interest in one of the most urgent problems before the American people today—the full use of our technological resource to win a decisive victory and to build an enduring peace. In our struggle to translate the total capabilities of this Nation into an effective striking force, we have every reason to be proud of the splendid achievements of science, both in industry and in Government. We must realize, however, that in reality we have only begun to marshal the inventive skills and energy of the American people on the scale required for the tasks which lie ahead.

There is a new and vital power at work in the modern world. The constant and rapid evolution of science and technology is a force

SCIENTIFIC AND TECHNICAL MOBILIZATION

THURSDAY, OCTOBER 14, 1943

UNITED STATES SENATE,
COMMITTEE ON MILITARY AFFAIRS,
SUBCOMMITTEE ON WAR MOBILIZATION,
Washington, D. C.

The subcommittee on war mobilization met at 10:30 a. m., pursuant to call of the chairman, Senator Harley M. Kilgore, West Virginia, presiding.

Present: Senator Harley M. Kilgore, West Virginia.

Also present: Herbert Schimmel, chief investigator.

The CHAIRMAN. The committee will come to order. We are reopening the hearings on Senate bill No. 702, the technical mobilization bill, The first witness, and the only witness today, will be the Vice President of the United States, the Honorable Henry A. Wallace.

Mr. Wallace, I wish you would go ahead in your own way and give us the results of your experience and investigation with reference to mobilization, cartels, patents, and anything pertaining to development of scientific research and its proper use in the United States and abroad.

STATEMENT OF THE HONORABLE HENRY A. WALLACE, VICE PRESIDENT OF THE UNITED STATES

Mr. WALLACE. Senator, my own personal experience has been largely based on my observation of the scientific work in the Department of Agriculture.

The CHAIRMAN. Well, Mr. Vice President, a study of this bill, I believe, would convince almost anybody that it is a bill to give to industry and business the same advantage that the Department of Agriculture has been endeavoring to give to the farmer of the United States.

Mr. WALLACE. That is why I am so much interested in the bill.

I welcome this opportunity to support your interest in one of the most urgent problems before the American people today—the full use of our technological resource to win a decisive victory and to build an enduring peace. In our struggle to translate the total capabilities of this Nation into an effective striking force, we have every reason to be proud of the splendid achievements of science, both in industry and in Government. We must realize, however, that in reality we have only begun to marshal the inventive skills and energy of the American people on the scale required for the tasks which lie ahead.

There is a new and vital power at work in the modern world. The constant and rapid evolution of science and technology is a force

Digitized by Google

changing the lives of all men. The dynamic pressure and stimulus of technology have already altered the structure of society beyond the farthest vision of our ancestors. Yet we know that these developments are still in their early stages. The profound transformations in the economic and political basis of society resulting from technological change have posed inescapable problems to democratic governments.

If advances in science are to bring corresponding advances in well-being, freedom and opportunity for growth to the people of the world, democratic governments must assume their share of responsibility. To facilitate broad and fruitful research, to do with the adjustments which must be made, and to explore those areas of science which directly concern national welfare, it is essential for Government to offer both guidance and asistance to the creative ability of our people.

One of the most priceless possessions of this country is the inventive ingenuity of the American public. To give free play to this creative urge and to provide support and encouragement for its expression, Government must cooperate with industry and with individual inventors.

The purpose of this bill, S. 702, as I understand it, is to unleash the energies of the American people by full use of labor, resources, and technology. The method is to foster scientific research and make it available to all people. The possible results are beyond computation, but I would estimate that each dollar of Federal money spent in such an enterprise would return in a few years many dollars of increased income—more than enough to compensate the Federal Government for any Federal outlay.

Total war is primarily a contest for superiority in the quantity and quality of equipment. It is therefore essential that we summon every atom of ability we possess to provide our fighting men with the best weapons that can be made. There is no surer way to reduce the cost in lives of our soldiers than to give them arms with more deadly efficiency than the enemy can match. To this end we must make certain that every avenue of research is completely explored—that every improvement of worth is brought to the attention of the Army and Navy, and that every necessary technical facility is made available for our armed forces.

The CHAIRMAN. On that line, Mr. Vice President, recently a study of shipping disclosed that we had not shipped abroad in this war, with more shipping, as many men as we had in a commensurate period in the last war. That was occasioned by the fact that with those men we send so much equipment; that the amount of equipment necessarily curtails the number of men. It requires a tremendously greater volume of shipping to keep the same number of men abroad because of that heavy equipment brought about by technological advances.

Mr. WALLACE. As I remember, in the first instance we send with each man going overseas something like 5 to 10 tons of material, and in the case of the men in the air forces it runs something like 15 to 20 tons of material.

The CHAIRMAN. That's right.

Mr. WALLACE. And after that about a ton every month.

The CHAIRMAN. Which means that ordinarily we can send only about 600 men for every 10,000-ton ship we load out. Pardon me for interrupting.

Digitized by Google

Mr. WALLACE. Shipping of such large quantities of materials does save lives, however.

The winning of the war is only the first step in the job we have to do. If scientific discovery is to be used to repair the ravages of war and to create a society in which full employment and full production are maintained, we must open the door to technology for all our people. This war has given us an insight into the potential scientific and industrial developments of the future. In aviation, in housing, in medicine, and in a whole range of new industries we shall have the chance to find new opportunities, to create better conditions of living, and to release the dynamic energy of democratic society.

To stimulate new enterprise, technological freedom, no less than political freedom, must be safeguarded. It is the responsibility of Government to see that no artificial barriers are placed in the way of these developments. We must utilize our wealth of scientific skill to guarantee a constant flow of new ideas and industries into our economy.

Out of our laboratories, both Government and private, is coming a flood of discoveries. When the veil of secrecy imposed by war is lifted our people will stand amazed at the array of inventions. A new world is being fashioned in our laboratories. Developments of new airplanes and helicopters, light metals and plastics, television and radio, new foods and medicines, will open vast industrial frontiers. These must be turned to achieving full employment of labor and full utilization of our productive resources. Without the fullest play of the principle of free private enterprise we shall fall short of this goal.

But free enterprise will be shackled and restrained if research is dominated by a small number of large corporations and cartels. This control has already barred small businessmen from many of our industrial developments, as the hearings before your committee, as well as other congressional committees, have demonstrated.

The application of modern science should not be the exclusive domain of great corporations and cartels who can, if they desire, restrict and suppress new inventions and scientific information to suit their own interests instead of the public interest. Unless the little man has access to the bounties of technology, free enterprise will suffer to the detriment of full employment of labor and our resources.

Small business cannot support the large and costly laboratories which are necessary for modern industrial research. To fill this need Government must make available these facilities. The lack of scientific and technological resources in small business institutions has hampered the mobilization of small business for the war effort. Evidence before this committee has indicated that most of our present research is concentrated in about 100 companies. This concentration, which inevitably results in the restricted dissemination of scientific information and know-how and the restricted utilization of the benefits of science, must be replaced by the broad basis proposed by S. 702. The philosophy of this bill will give to the big man as well as the little man opportunity to make his full contribution to the maximum employment of labor and greatest utilization of our natural resources.

There is one field of research with which I feel that I am quite familiar. For more than two generations the Government has taken an active part in conducting, sponsoring, and coordinating research

Digitized by Google

in agriculture. In fact, by far the greater part of all research done in agriculture has been initiated or aided by the Government. I do not wish to detract from the credit which is quite properly being given to the farmers, food handlers, farm machinery manufacturers, processors, and distributors for the amazing job which is being done in feeding and clothing a large part of the world. I believe that they should receive all the credit which we have been giving them and more. I don't believe anyone will seriously dispute with me the statement that their ability to do this grand job is very largely due to the vast number of improvements in crop production, handling, and processing which the years have brought.

In colonial times it required 19 families on the land to produce food for themselves and for 1 family in town, whereas today 1 family on the land raises for itself and 4 families in town. For every acre the average farmer cultivated in 1850 he now can cultivate 3 acres with greater efficiency.

It is only because of the extraordinary technological discoveries of the United States Department of Agriculture and the State experimental stations in soil management, cross-breeding, and livestock feeding that we in the United States have been able so far this year to ship food abroad at an annual rate of about 10,000,000,000 pounds, and at the same time give our own consumers the best diet they have ever had.

The Department of Agriculture, the State experiment stations, financed jointly by the Federal Government and the States, the four great regional laboratories, furnish abundant and conclusive evidence that Government research can lead the way.

I read this bill, S. 702, with the background of my association with the agricultural research program. I know full well that there are great fields of necessary research which cannot and should not be entrusted to the sole control of private companies whose primary aim and responsibility is to further the interest of their stockholders. These companies, particularly the larger ones, are doing a fine job of industrial research and a very large percentage of our advancement in that field is, of course, traceable to work in large commercial laboratories. However, one needs to focus attention not upon the advancement which has been made but rather upon that which might have been made and was not and upon what should be and may not. In some cases the blame for lack of advance may be put squarely on the shoulders of private interests whose selfishness has blocked advance. In a far larger number of situations, the failure to move forward is not the fault of any single company nor of any group. It is due to the lack of an over-all agency which is so constituted as to take the long view and so equipped as to do something about it. Public-supported research has done exactly that in the field of agriculture.

The primary objective of S. 702 is to enable Government to do the same thing in industry as it has already done in agriculture, but on a broader scale. It would provide a supplementation and coordination of existing research facilities, both public and private. It would extend to all technology something similar to the benefit which has come from coordinated effort in the field of agricultural research.

I believe that the small manufacturer is in a position not unlike the owner of the family-size farm. In each case there is lacking the

Digitized by Google

money, the personnel, the time, and the facilities for conducting adequate research. The defeat and elimination of either a family-size farm or a small manufacturer may be a momentary victory for a powerful competitor, but as a rule society is the loser. The Nation cannot allow its small farmers to suffer discouragement and defeat. The extensive agricultural research program has been a real contribution to free enterprise.

I have spoken on behalf of releasing our human and natural resources for victory and for peace—on behalf of unleashing the energies of the American people by the full use of labor, resources, and technology for the benefit of all. We are well on the march to victory because we have marshaled the irresistible power of cooperation between science, Government, and all classes of our people. We shall not fail in securing a peace commensurate with the awful price we have to pay for victory if we perpetuate this spirit of cooperation—if business enterprise, statesmen, and governments here and in other lands make resources and technology and the fruits of labor and ingenuity fully available to the many.

The ingenuity of our men of science, both in Government and private enterprise, and the direction given through our democratic form of government, have overnight created vast new industries. We have diverted most of our enterprises to war purposes, but much of that we have done in the interest of speedy victory will be economic distortions in peace and will call for speedy correction. The task of converting the new plants and facilities and putting both public and private inventions to useful work will be great and complex. We will succeed if we fix our eyes on the simple rule of wise government and of truly great enterprise; namely, the greatest good to the greatest number.

Other peoples, their governments, their scientists and their private enterprises face even greater problems than ours.

I may say that yesterday I was talking with Lord Keynes and he indicated that he felt the problem in this country would be greater than in England. I want to indicate that while there are countries which will have a greater problem than we will have, yet nevertheless we will have a greater problem than some other countries, especially England, because of the fact that England has increased her total output during the war—over the immediate pre-war period—by only some 15 percent. Her industry was quite fully employed in 1938 to 1939. We, on the other hand, had as recently as 1940 about 9,000,000 people unemployed and as a result of the stimulus of war we have increased our productivity by at least 30 percent, and probably by more than 40 percent. Therefore, the problem of reconversion will be very much greater in this country than in England.

The CHAIRMAN. Isn't it true that where we have gone in strongly for the building of huge plants in this country, England has largely utilized existing facilities?

Mr. WALLACE. That is entirely right. The regional distribution of our plants was governed more by doing the job with the greatest possible speed, falling into the pattern habits of large industry, rather than from a standpoint of putting the plants where there was the greatest reservoir of unemployed labor, rather than putting the plants where they would do the greatest good for our economy in the future.

The CHAIRMAN. That was necessary because we had to get a vastly increased production in a very short time.

money, the personnel, the time, and the facilities for conducting adequate research. The defeat and elimination of either a family-size farm or a small manufacturer may be a momentary victory for a powerful competitor, but as a rule society is the loser. The Nation cannot allow its small farmers to suffer discouragement and defeat. The extensive agricultural research program has been a real contribution to free enterprise.

I have spoken on behalf of releasing our human and natural resources for victory and for peace—on behalf of unleashing the energies of the American people by the full use of labor, resources, and technology for the benefit of all. We are well on the march to victory because we have marshaled the irresistible power of cooperation between science, Government, and all classes of our people. We shall not fail in securing a peace commensurate with the awful price we have to pay for victory if we perpetuate this spirit of cooperation—if business enterprise, statesmen, and governments here and in other lands make resources and technology and the fruits of labor and ingenuity fully available to the many.

The ingenuity of our men of science, both in Government and private enterprise, and the direction given through our democratic form of government, have overnight created vast new industries. We have diverted most of our enterprises to war purposes, but much of that we have done in the interest of speedy victory will be economic distortions in peace and will call for speedy correction. The task of converting the new plants and facilities and putting both public and private inventions to useful work will be great and complex. We will succeed if we fix our eyes on the simple rule of wise government and of truly great enterprise; namely, the greatest good to the greatest number.

Other peoples, their governments, their scientists and their private enterprises face even greater problems than ours.

I may say that yesterday I was talking with Lord Keynes and he indicated that he felt the problem in this country would be greater than in England. I want to indicate that while there are countries which will have a greater problem than we will have, yet nevertheless we will have a greater problem than some other countries, especially England, because of the fact that England has increased her total output during the war—over the immediate pre-war period—by only some 15 percent. Her industry was quite fully employed in 1938 to 1939. We, on the other hand, had as recently as 1940 about 9,000,000 people unemployed and as a result of the stimulus of war we have increased our productivity by at least 30 percent, and probably by more than 40 percent. Therefore, the problem of reconversion will be very much greater in this country than in England.

The CHAIRMAN. Isn't it true that where we have gone in strongly for the building of huge plants in this country, England has largely utilized existing facilities?

Mr. WALLACE. That is entirely right. The regional distribution of our plants was governed more by doing the job with the greatest possible speed, falling into the pattern habits of large industry, rather than from a standpoint of putting the plants where there was the greatest reservoir of unemployed labor, rather than putting the plants where they would do the greatest good for our economy in the future.

The CHAIRMAN. That was necessary because we had to get a vastly increased production in a very short time.

Digitized by Google

Mr. WALLACE. But our problem is the greater.

Many countries have had their resources not only distorted to war purposes but actually destroyed by the ravages of war. Some of them fear that their post-war markets for their resources have been placed in great jeopardy by the sudden rise of substitute industries elsewhere. Great as is our need for the full release of our scientific discoveries so that none of our regions, none of our occupations, and none of our industries be plagued with joblessness, even greater will be the call in other countries upon the power of government and technology because of the dual need for rehabilitation and for creating new uses for their raw materials and labor resources. If we or any other country find it necessary in the general interest to retain the newly created industries that deprive other countries of their pre-war markets, the living standards of other countries need not be undermined if modern science has a chance to put itself to work in the interest of the general welfare.

Science and technology, like good will, have no natural bounds. They can now counteract the maldistribution of the world's raw materials, and make nations less dependent upon distant sources of supply. They have also demonstrated another fact of tremendous import; namely, that natural resources are transmutable, interchangeable, and capable of multiple uses.

Increasingly, technology has become a concern of statecraft. The abrupt impact of science often produces maladjustments in our own economy and in the economic life of other countries. Government must be competent to deal with such situations, and to work out fair and just solutions.

To meet such needs, Government requires sufficient technical resources and information to formulate and to carry out sound technological policies.

It seems clear to me that this committee, in investigating the mobilization of scientific and technical resources, is working on one of the most important factors in winning the war and creating a secure, prosperous peace. The welfare and safety of our Nation depends upon a rapid growth of our sciences and techniques. But it also requires that the scientific findings be used to the benefit of all sections of the Nation. Both wartime and peacetime experience shows that, to insure this, advances should be made along the lines of S. 702. The most important in my opinion are:

1. There should be set up a central technical authority of the Federal Government. This authority should coordinate the increasing activities of the Government in scientific fields. It should not dictate the methods to be carried out by existing Federal scientific bureaus, but should serve as a clearing house for these organizations. It should help their understanding and willingness to work together as a team.

2. Every business and institution should have full access to all patents and research findings which have been developed at Government expense. The Congress has provided large sums of money, which are being poured into Federal, university, and industrial laboratories. It is the intention of the Congress that this money be spent for the benefit of the general public, not for the exclusive benefit of a few corporations. Likewise, the enemy patents seized by the Alien Property Custodian should become the property of the Federal Government and be made available to all businesses. These

Digitized by Google

patents should not be turned over to a few corporations or returned to their former alien ownership. The compensation should eventually be made to Axis nationals under procedures prescribed for all types of seized enemy property.

3. Federal support of research has achieved remarkable results in this war. This support should be continued in the post-war period. Today large corporations hold a virtual monopoly over laboratory facilities engaged in applied research. But there are many fields of research which are not fully covered by existing laboratory set-ups. There are a number of fields which require Federal support. I believe that Federal funds should support especially (*a*) fundamental science, the mother of applied science, with which the welfare and prosperity of the Nation rests; (*b*) research and development wherever it affects national interest such as in national defense, public health, public housing and the balanced regional development of the entire Nation. The Federal Government should see to it that the results of this research be distributed throughout the South as well as the North, the West as well as the East. There should be no concentration of benefits in specific institutions or areas.

4. Small business is in drastic need of technical information. Each State should have a technical information center. This center could distribute existing information which is in the hands of Federal agencies. But, more important, it could initiate research projects which are of special importance to the local area.

I can see no reason why the Federal Government cannot conduct the above activities while the Nation at the same time continues to benefit from private research. It can even assist industries which have up to now not realized the value of conducting their own private research. The balanced growth of all industries is of great importance to the progressive economic development of the country in the war and the post-war period alike.

If we use the catalytic, that is the stimulating, power of Government to aid private enterprise to serve the economic needs of the common man; if we cooperate with other governments to direct the good will that is in all of us and the genius that burns in the real men of science and enterprise toward a common goal; and if that common goal is abundance, security, and happiness, the present hell of war will be more certainly succeeded by the happiness of peace.

The CHAIRMAN. Returning to the question of agricultural development with Federal aid, my understanding has always been that the Department of Agriculture never interfered with new developments advanced by private industry. In other words, if some company got out a better harvester, the Department of Agriculture sought to help push that harvester in order to get better work on the farm; is that right?

Mr. WALLACE. Well, the Department of Agriculture never invented a harvester. It has developed certain machinery, but it has always cooperated with private enterprise.

The CHAIRMAN. But it sought to bring to the attention of the farmer the results of the inventions of private enterprise?

Mr. WALLACE. That is correct.

The CHAIRMAN. I have also been informed that in the United States we produce more on the farm, per man, today than do the European nations, due to our advanced farming techniques.

Digitized by Google

Mr. WALLACE. The average farmer and farm worker in the United States produces about five times as much as the average farm worker on the Continent of Europe.

The CHAIRMAN. In other words, then, we can produce the same amount of food with one-fifth the number of people engaged, or in one-fifth the labor time required abroad?

Mr. WALLACE. That is correct. I would not want an incorrect conclusion to be drawn. My statement should not reflect on the industry and hard-working ability of the European farmer, the European peasant. Typically, he has a much smaller area of land available to work and therefore finds it impossible to use many of the methods which our farmers have used so effectively.

The CHAIRMAN. Isn't it true that he has not been educated in the use of the more modern techniques by his governmental agencies to the same extent as in the United States?

Mr. WALLACE. There is, so far as I know, in no nation a scientific set-up at the disposal of the farmer equal to that which we have in the United States.

The CHAIRMAN. Another thing I am interested in with reference to agriculture, isn't it true that the Department of Agriculture's activities are such that they contribute funds and help to the various State universities but do not dictate their policies or methods?

Mr. WALLACE. The Federal money for State experimentation has been turned over to the State institutions with so few strings attached that there has been, until rather recently, very little coordination between the activities of the different State institutions.

The CHAIRMAN. Taking the success of the Department of Agriculture, would it not be advantageous to business, big and small, if a similar coordinating agency were set up to see that there were made available the best techniques, the best shop practices, and the most modern technical developments, in the interest of a competitive industrial system in the United States?

Mr. WALLACE. I think it would bring in most astounding returns and I hope the committee will look into the following point: Isn't it true that while the United States has led the way in governmental leadership in agricultural research, that there are other countries, notably Germany, where governmental leadership in industrial research has been very, very much ahead of anything that we have done in this Nation?

The CHAIRMAN. That is correct, unquestionably.

Mr. WALLACE. There would seem to be a danger that this country might fall behind industrially, or that what industrial research is conducted would be so exclusively in the hands of a few great corporations that our business would tend more to fall into huge over-all patterns.

The CHAIRMAN. In Germany hasn't the result been that the research sponsored by the Government has come into the hands of a few companies that are Government-controlled, which is not the democratic process and which we must avoid in our process?

Mr. WALLACE. I certainly would not hold Germany up to emulation in respect to the way in which the governmentally sponsored research has been used; quite the contrary.

Digitized by Google

The CHAIRMAN. One more thing, will not a flourishing competitive business, extending to the small businessman and the small manufacturer, help us in the post-war period on the question of war debts, by increasing the earning power of the United States, which automatically increases the amount we can apply on these debts?

Mr. WALLACE. It seems to me to be the only way in which we can shoulder the post-war debt easily. You might be interested in an overall summary in that respect.

The CHAIRMAN. I would be.

Mr. WALLACE. If, for example, the war should stop at a time when we had a total debt of $200,000,000,000—say, sometime during the year 1944—the interest on that debt, plus the interest on private debt, assuming current interest rates, would be a sum which, relative to a national income of $130,000,000,000 would be about the same percentage as existed back in 1929. Therefore the problem in carrying a $200,000,000,000 debt as easily as we did in 1929 would consist of having a national income of $130,000,000,000. Today, the national income is running perhaps at the rate of one hundred and forty or one hundred and forty-five billion dollars. In the post-war period, to attain a national income of $130,000,000,000, turning out the goods of peace, rather than the goods of war, it will be necessary not merely to have the great corporations which have received the greater part of the war contracts doing their job in full, but also to have a large number of small businessmen producing their segment of this $130,000,000,000 worth of business a year.

The CHAIRMAN. Another thing is this: Improved shop practices will enable us to produce in competition, don't you think, with the cheap labor abroad, so that we can continue to do business and not be injured as we were, by small stuff particularly, when Japan debased the yen in order to cut the earning power of their workers to meet the competition of American business.

Mr. WALLACE. I would hesitate to make a sweeping statement with regard to that because I don't happen to be familiar, technologically speaking, with the degree to which further research might make it possible to apply our superior inventive power and our superior know-how to meet Japanese competition, which might be based on an 80-hour week and 40-cents-a-day pay.

The CHAIRMAN. However, there is only one way to keep a man's wages the same and make him produce more and that is to teach him a better, quicker way to do the same job.

Mr. WALLACE. I am convinced that over any long-run period you can't keep labor down the way Japan has kept her labor down.

The CHAIRMAN. Unless you have something further, I think that is all, Mr. Vice President, and we appreciate your contribution here.

Mr. WALLACE. I believe this problem is of the utmost importance and I hope the committee continues its work along this line.

The CHAIRMAN. We are going to keep studying this problem and get all the information available.

We will recess until tomorrow at 10 a. m.

(Whereupon at 11:35 a. m. the subcommittee recessed until 10 a. m., Friday, October 15, 1943.)

SCIENTIFIC AND TECHNICAL MOBILIZATION

FRIDAY, OCTOBER 15, 1943

UNITED STATES SENATE,
COMMITTEE ON MILITARY AFFAIRS,
SUBCOMMITTEE ON WAR MOBILIZATION,
Washington, D. C.

The subcommittee met at 10:05 a. m., pursuant to adjournment on Thursday, October 14, 1943, in room 104, Senate Office Building, Senator Harley M. Kilgore, West Virginia (chairman of the subcommittee), presiding.

Present: Senator Harley M. Kilgore, West Virginia.

Also present: Herbert Schimmel, chief investigator.

The CHAIRMAN. The committee will come to order. At today's hearing we will first hear the testimony of the Honorable Wendell Berge, who has been subpenaed from the Office of the Attorney General. Mr. Berge, I wish you would open by stating your name and official connection with the Office of the Attorney General for the purpose of the record.

TESTIMONY OF HON. WENDELL BERGE, ASSISTANT ATTORNEY GENERAL OF THE UNITED STATES

Mr. BERGE. Wendell Berge, Assistant Attorney General in charge of the Antitrust Division, Department of Justice.

The CHAIRMAN. As you know, Mr. Berge, we have been taking testimony for some time with reference to the subject of patent monopoly. We are primarily interested, of course, in the possibility of monopoly of public-developed patents or patents developed with public funds; also the question of the monopolization of technical research, at the beginning of the war and during the war, and what effect such monopolistic tendencies may have had on the war up to the present time and might have on future operations.

I wish you would proceed, Mr. Berge, and from the records of your Division give the committee the information you have.

Mr. BERGE. I shall undertake this morning to make a general statement as to our view on some of these problems and also to give some background information from the files of the Department that indicates the abuses of patent monopolies and cartels, particularly with respect to the hampering of free development of technology and research.

As I go along, I expect to cite chapter and verse to support some of the points that I wish to make and I expect to bring out specifically

Digitized by Google

some instances of flagrant abuses that have been developed. I am going to start with a brief, general statement of some of the pertinent data as we see it.

In the days of Adam Smith it was possible to measure the wealth of nations in terms of mineral resources, possession of fertile lands, and control of strategic geographical areas. Today we have a new index to the wealth and security of nations. Technology and applied science have become principal instruments in the maintenance of a high standard of living and for the protection of national interests. In fact, when we speak of the balance of power in the modern world, we must take into account the extent and quality of industrial and technological resources as a dominant factor in national welfare. The horizons which have been opened by applied science and research offer to the world, and to our own Nation in particular, new industries, greater opportunities for our youth, higher levels of health and comfort, and the attainment of that genuine social security which comes with all great advancements in human knowledge.

Technology—its directions, its applications, and its enjoyment—is today a primary concern of Government. In a system based upon freedom of enterprise, access to technology is the fundamental condition of rapid advancement toward the goals for which our Nation is striving. The power that goes with the development of modern technology has been perverted in totalitarian countries to provide instruments of aggression. Because totalitarian states have regimented science and have made it subservient to imperial ambitions, it has been used to destroy rather than to create. One of the principal problems which the United Nations will encounter in the peace to come will be the prevention of any abuse of new discoveries for the purpose of establishing war machines which can threaten the peace of the world.

The control of vital areas of research by monopolistic interests is a condition which cannot be tolerated. Monopoly control seeks to protect vested interests and to perpetuate its grip on the advancement of science and technology. It retards the introduction of new goods and services and the maintenance of full employment in time of peace. Our experiences in this war have demonstrated conclusively that monopolistic control of critical sectors of industrial research has a paralyzing effect on mobilization of our national strength. One of the most difficult problems we have encountered in arming this country has been the domination and restriction of technology by small privileged groups. It has required strenuous efforts on the part of Government and industry alike to overcome the stifling effects of complacent monopoly.

The CHAIRMAN. Mr. Berge, do you care to specify some of these groups?

Mr. BERGE. Yes. I can refer to aluminum, magnesium, military optical instruments, plastics, synthetic rubber, and a host of others. I suspect that later in these hearings we will develop in greater detail some of these specific case histories.

The CHAIRMAN. How about synthetic gasoline?

Mr. BERGE. Yes; that would certainly be one.

With rare exceptions industrial research at the present time can only be carried on by large numbers of scientists and technicians

Digitized by Google

combining their ingenuity to resolve the complex problems of both pure and applied science. In the last 50 years technology has moved at such a rapid pace that no longer is the small businessman in a position to maintain laboratories of sufficient size. Today we witness the gigantic research organizations of all major corporations, and no one desires to impair their efficiency.

There is, nevertheless, a gap between the promise of organized research conducted on a huge scale by great corporations and the fulfillment as measured by accomplishments for the public interest. So that there shall be no misunderstanding, I should like to pay tribute to the vast army of scientists and research workers who have done such remarkable work in the years of peace as well as in the years of war in bringing forth a multitude of amazing discoveries. It is not their fault that their contributions have not been fully realized.

The CHAIRMAN. Does the technologist employed by a large corporation determine the use that will be made of the discoveries he produces in the plant? In other words, it has been claimed that any effort on the part of the Government would amount to a strait jacket on the scientist. Does the technologist or scientist, working in a large laboratory, have anything to say about what is going to be done with what he invents?

Mr. BERGE. I don't think he has much to do about it, Senator. Our observation and our investigations would be that the universal practice, almost, is that the research worker or technologist obligates himself to assign to the corporation that he works for every invention or discovery that he makes while he is employed by it.

The CHAIRMAN. And that is for a very nominal figure, is it not?

Mr. BERGE. Generally, yes. They would claim, usually, that it is recognized in his salary, but I think usually it's just part of the consideration of his having the job. The way it usually works is that his superiors in his own department or officials from other departments in the company make the decision as to which, if any, of his ideas shall be used and developed, and we have found numerous instances of keen and severe disappointment and discouragement on the part of inventors—salaried inventors and scientists—at the failure of their superiors to pick up and utilize ideas which they have developed, inventions which they have made and which, as scientists, they at least feel are much in the public interest and which ought to be developed. But for some economic motive, usually, the company has felt that it couldn't go ahead and develop the invention and the man himself is not free to license it to others who might be willing to develop it.

The CHAIRMAN. Now, under the law, the corporation owning the laboratory cannot, of course, procure the patent, but under the contract with the individual the corporation requires the individual to procure the patent and assign it to the corporation which, under our patent law, is absolutely legal.

Mr. BERGE. That's right.

The trouble is that in many instances the misuse of research by monopolistic and cartelized groups has resulted in the restricting of production, withholding new products, and fencing in and blocking of new developments.

Our observation and our investigations would be that the universal practice, almost, is that the research worker or technologist obligates himself to assign to the corporation that he works for every invention or discovery that he makes while he is employed by it.

The CHAIRMAN. And that is for a very nominal figure, is it not?

Mr. BERGE. Generally, yes. They would claim, usually, that it is recognized in his salary, but I think usually it's just part of the consideration of his having the job. The way it usually works is that his superiors in his own department or officials from other departments in the company make the decision as to which, if any, of his ideas shall be used and developed, and we have found numerous instances of keen and severe disappointment and discouragement on the part of inventors—salaried inventors and scientists—at the failure of their superiors to pick up and utilize ideas which they have developed, inventions which they have made and which, as scientists, they at least feel are much in the public interest and which ought to be developed. But for some economic motive, usually, the company has felt that it couldn't go ahead and develop the invention and the man himself is not free to license it to others who might be willing to develop it.

The CHAIRMAN. Now, under the law, the corporation owning the laboratory cannot, of course, procure the patent, but under the contract with the individual the corporation requires the individual to procure the patent and assign it to the corporation which, under our patent law, is absolutely legal.

Mr. BERGE. That's right.

The trouble is that in many instances the misuse of research by monopolistic and cartelized groups has resulted in the restricting of production, withholding new products, and fencing in and blocking of new developments.

Digitized by Google

I think one of the ablest and clearest statements of the effect of restrictive arrangements upon research was made by Dr. F. B. Jewett, vice president of the American Telephone & Telegraph, and chief of their Bell Laboratories. In discussing an agreement between his company and other parties, he stated:

> Broadly speaking, the practical effect of the agreement is to limit the field of possible development of each party to its present major activities. * * *
> Thus, while a casual reading of the agreement by one not thoroughly conversant with all the factors may appear to establish the basis for an enlarged free development in most of the fields, this is not actually the case.
> * * * * * * *
> The far-reaching effect of the proposed agreement on the character and scope of our research and development work is apparent. Viewed both from the standpoint of the research worker in our laboratories and from the standpoint of those responsible for the expenditures incurred by the laboratories, the inevitable result would be a narrowing of the field of activity and failure to undertake anything which at the outset is not clearly directed to the field of our current business. From the standpoint of the man who has a brilliant idea which in its first nebulous form seems to be applicable outside our business, there will be little or no urge to go ahead in the face of a situation where he knows that the results of his work have been sold in advance outside of the Bell System. From the standpoint of management there will likewise be no incentive, but quite the reverse, to urging him on and appropriating money for his investigations.[1]

The CHAIRMAN. Mr. Berge, have you read Mr. Jewett's testimony before this subcommittee?

Mr. BERGE. I'm sorry, Senator, I have not.

The CHAIRMAN. In that testimony, as I recollect it—and I am speaking purely from memory—he describes the telephone corporate set-up and organization. He describes it as a public-service company, built up to give service to the public, and he describes its subdivisions, its research organization, its manufacturing organization, and its service companies and the method in which they are handled. I believe if you would analyze that testimony in comparison with Senate bill 702, you would find that Senate 702 parallels the organization of that group of companies to a large extent. In his testimony he stated that in his opinion the organizational set-up in that group of companies was an ideal organization of a public corporation, similar to a governmental organization whose purpose was to sell service to the people, and not to sell products to the people. Of course, that is the purpose of government, to sell service; we don't sell products.

Mr. BERGE. That is very interesting.

The CHAIRMAN. Please go ahead.

Mr. BERGE. I am going to speak briefly about the conflicting loyalties which the cartelization of industry brings about.

The CHAIRMAN. May I interrupt you at that point for a moment, Mr. Berge? Do you have in your mind a definition of the word "cartel"? It has been used so much in the newspapers; we hear it so much that I should like to have a comprehensive definition of a cartel. I know the old definition and I have a general understanding of the new one, but I should like the record to show the definition of the word "cartel" as it is used by American corporations.

Mr. BERGE. I think that this definition will suffice for our discussion and, of course, there are different notions on the parts of differ-

[1] Exhibit No. 143 on p. 935.

Digitized by Google

ent people as to what a cartel is, but I think this is a good generalized statement of it: In its simplest form, a cartel is an international combination or agreement between domestic and foreign monopoly groups which fixes prices, divides market territory and fields of production. In general, domestic concerns which dominate a national market enter into cartel agreements to prevent any possibility of competition. In other words, it is an international combination or agreement of monopolies. As we use the word, it is monopoly in an international field and the constituent members of the cartel are usually monopolies themselves within their domestic domains.

The CHAIRMAN. It amounts to a trade treaty without governmental participation?

Mr. BERGE. A private trade treaty without public ratification.

Mr. SCHIMMEL. How does that affect technology, as a rule, Mr. Berge?

Mr. BERGE. Of course, that calls forth, really, a good deal of discussion, and it will come out, I think, as we go along, both in this and in subsequent hearings; but I think, in general, if the monopoly controls an industry, the criterion as to whether particular inventions shall be advanced or not is largely profit, whether or not it is in the monopolistic interest to push the development forward. If you had, on the contrary, a competitive situation, no monopoly could control or suppress the development of technology, because if it didn't go ahead with it, others would. That might raise the question in the minds of some, "How could others go ahead with it if the competitor had the patent?" Of course, the answer to that would be that under a licensing system all comers who are ready, willing, and able to go ahead with the development could secure a license to use it at a reasonable royalty, if the holder of the patent did not desire to develop the product. But where you have monopoly control of an industry and of the patents, the private interest of the monopoly, rather than the public interest in technological advancement, determines whether the thing shall be developed or not. When you extend that to the international scale, nationalistic considerations come in. If you have the monopoly of one country assigning to a monopoly of another, its brother member of the cartel, the patents which have been developed at home, that means they become available for development for use in the other country, according to the terms of the licensing arrangement or the terms of the cartel agreement, which often provide that the developments can't be advanced in the respective countries of the members without joint approval of the respective members. Translated to more concrete terms, that means that an American company belonging to a cartel may be restricted to manufacturing products under its patents at home without the permission or consent of the foreign member. Of course, the details of the various agreements vary, but I think as we go along specific cases will reveal how technology at home has been restricted or stopped in certain industries because we were bound by agreements with German companies and by companies in other countries.

The CHAIRMAN. Isn't it a fact also that cartels compel American companies to disseminate information abroad, and that at the conclusion of the war inventions of vast strategic value will be available

Digitized by Google

to nations that may use those inventions against us at some future time?

Mr. BERGE. Precisely. That has happened in a number of cases, and often the effect of the agreement, as our companies have entered into it, is that the foreign countries are free to go ahead with the inventions while we are not. At least they do go ahead, sometimes perhaps in violation of their agreements, while our companies scrupulously observe theirs to the detriment of our national interest. I am going to show how that conflict has occurred.

A member of a monopoly or cartel group all too often finds itself in a position where it must choose between the national interest on the one hand and its cartel obligations on the other. This difficulty is accurately stated in a document taken from the Standard Oil Co. (New Jersey) files with reference to the development of 100-octane gasoline, one of the most vital materials of modern warfare. I quote from the document:

> This possibility is, of course, extremely attractive to the Army Air Corps, but there is one difficulty involved which Mr. Russell quite frankly discussed. The hydrogenation development originated in Germany, and through cooperation all around has now passed into the hands of the oil industry of the entire world, and to a certain extent, into the hands of the foreign chemical industry as well. There is a full and free exchange of technical information between all of the companies and units involved in the hydrogenation development and this exchange is not only by means of reports but by constant visits of technical men. To cut off these reports and shut our hydrogenation plants against these visitors would be not only a violation of these agreements, which would involve us in many difficulties, but would also be tantamount to a confession that we were engaged in some work of special military value which would mean that the plants would become a focal point for espionage. The costs and difficulties of protecting against leakage of information about large commercial operations under such conditions is hard to estimate. *It seems that the only practical way to handle this problem is to avoid carrying out the operation of producing 100-octane number aviation gasoline commercially as long as possible.* We would, of course, also have to breach our agreements to render full and complete technical reports to all of the companies associated with us (even to the American companies, for fear of leakage). We should also forfeit the advantage in producing at the least cost the best available gasoline for commercial purposes.
>
> *Any program by which the Army Air Corps can obtain their objective of a 1- or 2-year start over the rest of the world on this vital matter bristles with difficulties and sacrifices from our standpoint.* We will not have to cross the bridge finally until our present experiments are completed. When and if we are able to demonstrate that the hydrogenation plants are capable of turning out an aviation product which with the usual quantity of lead can be brought up to the 100-octane number, we shall be faced with the situation mentioned above. *To meet the very proper desires of the Air Corps as expressed to us we shall have to violate our agreements and perhaps forfeit the confidence of our associates, both American and foreign, and beyond this we shall either have to avoid any commercial use of the new method or run the very grave risk of finding that our efforts at secrecy have been abortive.* [Italics supplied.] [1]

The CHAIRMAN. That was contained in a communication in the files of Standard Oil Co., in explaining their actions several years before the war?

Mr. BERGE. That's right.

The CHAIRMAN. Mr. Arnold made a supplementary statement for the Truman commitee last year which showed that German technologists were sent to this country to get all possible information for constructing aviation-gasoline plants immediately prior to the invasion of Poland and the outbreak of the war. As I recall it, these men were

[1] Arnold exhibit No. 75, p. 4916, pt. 11, Hearings of the Special Senate Committee Investigating the National Defense Program, 1942.

Digitized by Google

welcomed into the laboratories and designing rooms of Standard Oil of New Jersey and its affiliates and given full information. In connection with the documents which revealed these facts, did you find any indication that this program of disclosure of information was brought to the attention of our Air Corps and their approval secured in advance?

Mr. BERGE. Our documents do not show any disclosure of that information to the Air Corps. I would be amazed if the Air Corps, knowing it, would have permitted it. We have no reason to think they knew it.

The CHAIRMAN. The hydrogenation process is the process where you can take petroleum and bring it to a high octane content cheaply and rapidly, and that would increase our production of aviation gasoline tremendously?

Mr. BERGE. Yes; I think so. There may be more to the process than that. I am not very familiar with the technical, scientific implications. Mr. Borkin may supplement that.

Mr. JOSEPH BORKIN (economic adviser on cartels and patents, Antitrust Division, Department of Justice). It is also the process where you make gasoline out of coal and that was an additional use.

The CHAIRMAN. But you could take petroleum, and by the incorporation of hydrogen at high temperature and high pressure, raise the octane content of the gasoline tremendously?

Mr. BERGE. That's right.

Dr. ROBERT M. HUNTER (Special Assistant to the Attorney General). Might I suggest something? You used the word "cheaply" in connection with this. I don't believe this can be characterized as a cheap process.

The CHAIRMAN. It is not cheap in money, but it is cheap in natural resources. At the present time we are having difficulty with our petroleum resources in getting the necessary materials to raise gasoline to 100-octane rating without the use of the hydrogenation process.

Mr. SCHIMMEL. Mr. Berge, doesn't your testimony show that the Standard Oil Co. was unwilling to go ahead with a commerical program of 100-octane gasoline?

Mr. BERGE. They felt that there was danger under the agreements which they had with these foreign companies.

Mr. SCHIMMEL. Who were these foreign companies?

Mr. BERGE. I. G. Farbenindustrie.

Mr. SCHIMMEL. Did I. G. find it so difficult?

Mr. BERGE. I think they closed the door to us.

Mr. SCHIMMEL. Did I. G. enter into the commercial production of aviation gasoline which the Standard Oil Co. found so difficult?

Dr. HUNTER. A very large part of the gasoline of Germany was prepared in these hydrogenation plants of I. G.

Mr. BERGE. In pointing out the inevitable conflicts between national loyalties and business interests which arise when industry is carried on through private international cartel agreements, I do not attack, nor do I intend to cast inferences against, the patriotic motives of any men or companies. I shall assume that the persons who have taken part in these international transactions to which I am going to allude have not consciously acted against the best interests of their country. But it is the cartel system that is at fault—a system of con-

Digitized by Google

ducting international business on the basis of international restraint of trade in the interest of private groups. The individuals caught up in the system are faced with a dilemma because it imposes on them choices which it is almost impossible to make without violation of an obligation to one of two conflicting interests.

The CHAIRMAN. Isn't it a fact that our companies, private corporations and not Government controlled, are dealing with governmental monopolies abroad in entering into this cartel agreement, thereby placing our private companies at the mercy of the Government decisions abroad, in case of an international crisis?

Mr. BERGE. I think, generally speaking, that is the way it works out.

The CHAIRMAN. And our people, being honorable business people, do not realize that the Government abroad may change the complexion and character of the corporations with which they are dealing.

Mr. BERGE. I think that's true.

One of the most serious limitations upon research has been the division of fields of technology by cartel groups. If a company is barred by agreement from an aspect of technology, there is little if any incentive to do research in that field. One possible consequence of such division of technology is that it permits foreign interests to exercise influence amounting to domination over research in this country.

No one doubts that synthetic rubber is a matter of national interest. The cartel arrangement between Standard Oil Co. (New Jersey) and I. G. Farbenindustrie was such that the latter dominated the development of synthetic rubber in this country as well as in Germany. I understand that your committee has caused the 10 volumes of Senate Patent Committee Hearings to be condensed into one volume.[1] In the story of synthetic rubber in that volume you will find clear evidence of the working of this arrangement and of the manner in which technology in this country was hampered as a result of it.

The CHAIRMAN. Mr. Berge, I want to invite your attention to Newsweek of September 27, 1943, and to call your particular attention to an article by Ralph Robey. Have you read that article?

Mr. BERGE. I haven't read it, Senator; no.

The CHAIRMAN. The article attacks the Vice President for alleged campaign of disunity, and it says:

> The particular cause of the Vice President's wrath is an agreement made by Standard during the twenties with I. G. Farbenindustrie of Germany, by which Standard, at a cost of about $35,000,000, obtained a part interest in certain patents held by Farben. It was not a "secret" agreement, as Mr. Wallace says. On the contrary it was widely covered by the press at the time. What is important is the following:

And it lists several items, including the following:

> 4. As a result of this agreement we got buna rubber—which is the basis of our synthetic-rubber program—and thereby had a chance to experiment with what could be done with it. Former Rubber Director Jeffers said last June that as a result of this experimentation our synthetic-rubber program is a year and a half further ahead than it otherwise would be.

What do the files in your office disclose with reference to the statements made by Mr. Robey in that article as to the development of

[1] Pt. 4, Hearings of the Subcommittee on War Mobilization of the Senate Committee on Military Affairs, 1943.

Digitized by Google

buna rubber and whether or not its development was advanced, or was it actually delayed, as far as you are concerned?

Mr. BERGE. I think Dr. Hunter is more familiar with that matter than I am.

Dr. HUNTER. I read the article and I think the Vice President's statement that Mr. Robey was criticizing undoubtedly had taken into consideration testimony which I gave before the Senate Patents Committee. I was allowed to see what purported to be all of the documents pertaining to buna and butyl ruber in the Standard Oil Co. files. In my testimony before the Patents Commitee I introduced every document which I thought had a pertinent bearing on the relationship between I. G. Farben and Standard Oil Co. of New Jersey, with reference to synthetic rubber. This statement that is quoted and that you read, "As a result of this agreement we got buna rubber." I think needs some explanation.

The agreement that was publicized at the time—never publicized in full, but publicity was given to it—was one which concerned the turning over to Standard Oil, or to Standard-I. G. Co., a subsidiary corporation, the hydrogenation patents for exploitation throughout the world.

The CHAIRMAN. Those hydrogenation patents were American, were they not?

Dr. HUNTER. American patents on file in the American patent office.

The CHAIRMAN. And on which they now base their aviation fuel program in Germany; isn't that the fact?

Dr. HUNTER. That's right. The hydrogenation agreement was only one of a series of four agreements executed at the same time. The other three were not given publicity at all. When Mr. Robey says that this was not a secret agreement, he's referring to the division of fields agreement, which Vice President Wallace mentioned, and that was a secret agreement and remained so until the Antitrust Division found it in the files and made it public.

The CHAIRMAN. Wasn't it also a fact that in that cartel, with reference to rubber, progress was retarded in this country because, under the cartel agreement, Standard had to get permission of I. G. Farben before they could release any of these patents, or any of these processes in the United States?

Dr. HUNTER. Before they could do anything toward exploiting buna rubber in this country.

The CHAIRMAN. Whereas the I. G. could go ahead and exploit hydrogenation processes in Germany without consulting Standard.

Dr. HUNTER. That's true. The statement that we got buna rubber from this agreement needs to be read in the light of this situation: In the fall of 1939, just after the outbreak of the war, Dr. M. B. Hopkins was placed in charge of the synthetic-rubber program for Standard Oil Co. A memorandum, which is in the Truman committee hearings, reports a conference which he had on October 18 or 19 with Dr. P. K. Frolich, now president of the American Chemical Society, who was then and is now head of the Chemical Division of Esso Laboratories of Standard of New Jersey. In reporting this discussion with Dr. Frolich, Dr. Hopkins said: "Our people have never made buna, but the chemical laboratories are starting experiment." This is in the fall of 1939, after the deal at The Hague, in which Standard was permitted to go ahead in this country. The memorandum continues:

Digitized by Google

The development division has assembled data, largely from patents which are sufficient to make preliminary estimates possible. The I. G. has not furnished anyone technical information, although Mr. Murphrey walked through one of the plants several years ago.[1]

The next day, on October 20, Dr. Hopkins reported to his superior, Mr. Frank Howard, president of Standard Development Co., as follows:

DEAR MR. HOWARD: You asked about the amount of technical information available on the manufacture of buna rubber. Excepting the information Mr. Murphrey was able to get when he went through an I. G. plant 8 years ago—

that was in 1931—

the only knowledge our people have is derived from published patents.[2]

It was testified before the Patents Committee, and is unquestionably the fact, that no information was obtained—no technical information was obtained—concerning buna rubber after the outbreak of the war. I quoted you these statements from the Standard files indicating they got no information prior to October 1939. I have made the statement that they got no information subsequent to that time from Germany, except what was contained in the published patents which any person could have obtained by going to the Patent Office. Therefore, when the statement is made that we got buna rubber from I. G. as a result of that agreement, what it really amounts to is this: Standard Oil got the right to sue anybody for infringement of these American patents which had formerly been held by I. G. Farben, and which they threatened to do and actually did do, about 6 or 8 weeks before Pearl Harbor, in suing a subsidiary of B. F. Goodrich Co. for infringement of the buna patents.

The CHAIRMAN. In other words, the patent does not contain the know-how with which to manufacture?

Dr. HUNTER. Definitely not. It very definitely does not contain all the information that is necessary to go ahead. In connection with these synthetic-rubber patents, Standard Oil, on its own hook, did develop know-how, but they said themselves that all they got was the buna patents, so far as I. G. Farben was concerned.

The CHAIRMAN. But the real know-how for making buna was developed in this country by Standard without assistance from Farben?

Dr. HUNTER. That is what the statements say and the man who made the statements was the man in charge of synthetic-rubber development for Standard Oil.

The CHAIRMAN. In the language of the country lawyer, Standard got the right to bring a lawsuit, whereas Farben had a process which they could use.

Dr. HUNTER. Also, a year and a half prior to this, in the spring of 1938, Standard had given full disclosure as to how to make butyl rubber, and samples of it, to the I. G. Farben people, who, at that time, were working directly under the Hitler government.

The CHAIRMAN. Isn't it also the fact that not only cartel proceedings in the courts were required but also public hearing before the

[1] Arnold exhibit No. 18, p. 4858, pt. 11, Hearings of the Special Senate Committee Investigating the National Defense Program, 1942.
[2] Arnold exhibit No. 19, Ibid.

Digitized by Google

Truman committee before we could get the rubber patents into the production process?

Dr. HUNTER. I think that's a fair statement.

Mr. SCHIMMEL. Dr. Hunter, did those documents show whether a greater amount of research on buna-type rubber was being done in Germany than in America?

Dr. HUNTER. Unquestionably more of it had been done by I. G. Farben and its associates and the other companies in Germany than had been done in the Standard Oil set-up in this country. Now, if you mean were any companies in this country engaged in research, the answer is "Yes." Goodrich and Goodyear for years were engaged in very exhaustive research in attempting to develop the buna-types of rubber, and were trying all through those years, from 1931 to and after the outbreak of war, to get the permission of Standard Oil and I. G. Farben to participate in the development and exploitation of buna-type rubber that Farben developed, but they had no success; that is, the efforts to get participation were without success.

Mr. SCHIMMEL. Did any of these companies hold up their research in the hope they would be able to get technical information from the German companies according to the agreements you refer to?

Dr. HUNTER. I can't say whether they held up their research; I do know they were anxious to get whatever assistance they could from Standard Oil and I. G., and weren't able to get it.

The CHAIRMAN. Isn't it true that butyl was an American development?

Dr. HUNTER. That's right.

The CHAIRMAN. And that it was furnished quite freely to Germany while Farben at the same time was withholding from Standard the know-how on buna?

Dr. HUNTER. That's right.

The CHAIRMAN. Under the cartel butyl was a problem to get into development, although it was needed for gas masks and for various other necessary purposes, including inner tubes.

Dr. HUNTER. That's right.

The CHAIRMAN. Mr. Berge, will you please go ahead. I'm sorry for so many interruptions.

Mr. BERGE. In the case of the Bausch & Lomb-Zeiss cartel on military optical glass, the heads of the Bausch & Lomb department responsible for military research were to be appointed only with the agreement of Carl Zeiss of Jena, Germany. This is provided for in a contract dated December 24, 1926, which stated:

> In furtherance of the aims of this agreement, the Bausch & Lomb Optical Co. in Rochester will create a new department responsible solely to the board of directors, which is charged with the independent development of all scientific and technical tasks within the military scope and the maintenance of associations with the firm of Carl Zeiss in Jena. The parties will come to an agreement as regards the heads to be placed in charge of this department.

The CHAIRMAN. Mr. Berge, as I recall, there was a shortage of field glasse in the United States at the outbreak of this war and private citizens were asked to donate their filed glasses that we might get lenses for use by our Army and Navy in combat. This situation was brought about because of the failure of the development and production of an American company—Bausch & Lomb?

Digitized by Google

Mr. SCHIMMEL. Is Bausch & Lomb an American company or a German company?

Mr. BERGE. An American company in Rochester, N. Y.; Zeiss is the German company.

Mr. SCHIMMEL. But the German company dictated the research personnel of the American company?

Mr. BERGE. As I understand it, Mr. Schimmel, the German company had a veto power over who was to conduct research in our country.

In regard to the cartel involving Plexiglas, probably one of the most important plastics, and one which has innumerable military uses, the Röhm & Haas Co. of Philadelphia, a member of this cartel, stated:

> * * * we could think of a price agreement on the finished product, or a division of our interests. I told him we have not only our own interests at stake but also the ones of our German house (Rohm & Haas of Darmstadt, Germany) and the I. G.

The CHAIRMAN. Do you have anything in your records with reference to the connection between Röhm & Haas of Philadelphia and Röhm & Haas of Darmstadt?

Mr. BERGE. Yes. Mr. Borkin will explain that.

Mr. BORKIN. Before the First World War—in fact, during the early part of the twentieth century—Röhm and Haas formed a partnership to exploit certain chemical processes in Germany. After a time, Mr. Haas came to the United States and formed a company here, also called Röhm & Haas, on the same basis as the German company was owned, or 50 percent each by Röhm and Haas. When the war broke out, that is, the First World War, the Alien Property Custodian seized the half owned by Dr. Röhm, so that we had the situation where the Alien Property Custodian and Haas owned the company. The Alien Property Custodian sold it to a chemical tanning firm of Chicago and after a few gyrations the ownership of that stock came back to Mr. Haas and then to Dr. Röhm, so that at the opening of this war it stood at the same position, practically, that it did at the start of the First World War, and I understand in this war again the Alien Property Custodian has seized a portion of the stock.

The CHAIRMAN. Plexiglas is the clear substance we used in the noses, sides, and tails of our planes?

Mr. BORKIN. It has a great advantage over glass because it is lighter and clearer.

The CHAIRMAN. And it is not subject to fragmentation; isn't that right?

Mr. BORKIN. That's right.

Mr. BERGE. To mention another one, the second largest producer of tungsten carbide, an essential machine tool ingredient, has testified, and I quote:

> The control of the tungsten carbide patents by the General Electric Co. and the Krupp Co. has resulted in keeping the prices at exorbitant levels. Now when the emergency has come, industry has not learned how to use tungsten carbide and has not the machines, the skilled men, or the technique which it would have had if the material had been available at the same low prices at which it was available to German industries.[1]

[1] Lewin exhibit No. 3, p. 219, pt. 1, Hearings of the Senate Committee on Patents, 1942.

Digitized by Google

The CHAIRMAN. Do you recall the differences in those prices?

Mr. BERGE. Roughly, yes. I think it was around $50 in Germany and as high as $453 in the United States.

The CHAIRMAN. For the same substance?

Mr. BERGE. For the same substance; yes.

In December 1934 a high official of the du Pont Co. wrote to E. W. Webb, president of the Ethyl Corporation, with copies to every member of its board of directors, as follows:

I learned through our Organic Chemicals Division today that the Ethyl Gasoline Corporation has in mind forming a German company with the I. G. to manufacture ethyl lead in that country.

I have just had 2 weeks in Washington, no inconsiderable part of which was devoted to criticizing the interchanging with foreign companies of chemical knowledge which might have a military value. Such giving of information by an industrial company might have the gravest repercussions on it. The Ethyl Gasoline Corporation would be no exception, in fact, would probably be singled out for special attack because of the ownership of its stock.

It would seem, on the face of it, that the quantity of ethyl lead used for commercial purposes in Germany would be too small to go after. It has been claimed that Germany is secretly arming. Ethyl lead would doubtless be a valuable aid to military airplanes.

I am writing you this to say that in my opinion under no conditions should you or the board of directors of the Ethyl Gasoline Corporation disclose any secrets or "know-how" in connection with the manufacture of tetraethyl lead to Germany.[1]

Yet, in the face of this warning from du Pont, on January 12, 1935, Webb wrote the Chief of the Army Air Corps that—

There is no technical data of military importance known to us which would be involved in the building of such a plant that has not already received wide publicity, or is of common knowledge in the aviation field.[2]

This statement strikingly ignores the warning received from du Pont only 1 month earlier that such a disclosure would "doubtless" be prejudicial to our national security. In this connection it should not be overlooked that du Pont and Dow were the sole producers of the chemical components of tetraethyl lead and, as such, were the concerns which alone possessed the essential know-how.

Why did Ethyl Gasoline disregard du Pont's warning? Webb himself has supplied the answer in the final paragraph of the statement of facts accompanying his letter of January 12, 1935, mentioned above. He frankly stated that—and I quote:

There is, furthermore, an equally, if not more, important business aspect to the German situation. We are owned by the Standard Oil Co. (New Jersey) and General Motors Corporation in equal shares. General Motors has important investments in Germany, producing there in excess of 50 percent of the motor cars. Standard Oil (New Jersey) has large investments in all phases of the petroleum business in Germany. * * * We feel * * * for the reasons specifically mentioned here, that it would be extremely unfortunate for all concerned if we do not proceed to carry out the agreement with I. G. * * * A refusal or undue delay on our part * * * might bring on some serious reprisal measures.[2]

This leaves nothing for surmise. It is not unfair to conclude, in view of these facts, that for the directors of Ethyl Gasoline the preservation of I. G. goodwill conflicted with the maintenance of good faith in dealings with their own Government. Though du Pont, from the beginning, was opposed to the entire deal on grounds of patriotic

The development division has assembled data, largely from patents which are sufficient to make preliminary estimates possible. The I. G. has not furnished anyone technical information, although Mr. Murphrey walked through one of the plants several years ago.[1]

The next day, on October 20, Dr. Hopkins reported to his superior, Mr. Frank Howard, president of Standard Development Co., as follows:

DEAR MR. HOWARD: You asked about the amount of technical information available on the manufacture of buna rubber. Excepting the information Mr. Murphrey was able to get when he went through an I. G. plant 8 years ago—

that was in 1931—

the only knowledge our people have is derived from published patents.[2]

It was testified before the Patents Committee, and is unquestionably the fact, that no information was obtained—no technical information was obtained—concerning buna rubber after the outbreak of the war. I quoted you these statements from the Standard files indicating they got no information prior to October 1939. I have made the statement that they got no information subsequent to that time from Germany, except what was contained in the published patents which any person could have obtained by going to the Patent Office. Therefore, when the statement is made that we got buna rubber from I. G. as a result of that agreement, what it really amounts to is this: Standard Oil got the right to sue anybody for infringement of these American patents which had formerly been held by I. G. Farben, and which they threatened to do and actually did do, about 6 or 8 weeks before Pearl Harbor, in suing a subsidiary of B. F. Goodrich Co. for infringement of the buna patents.

The CHAIRMAN. In other words, the patent does not contain the know-how with which to manufacture?

Dr. HUNTER. Definitely not. It very definitely does not contain all the information that is necessary to go ahead. In connection with these synthetic-rubber patents, Standard Oil, on its own hook, did develop know-how, but they said themselves that all they got was the buna patents, so far as I. G. Farben was concerned.

The CHAIRMAN. But the real know-how for making buna was developed in this country by Standard without assistance from Farben?

Dr. HUNTER. That is what the statements say and the man who made the statements was the man in charge of synthetic-rubber development for Standard Oil.

The CHAIRMAN. In the language of the country lawyer, Standard got the right to bring a lawsuit, whereas Farben had a process which they could use.

Dr. HUNTER. Also, a year and a half prior to this, in the spring of 1938, Standard had given full disclosure as to how to make butyl rubber, and samples of it, to the I. G. Farben people, who, at that time, were working directly under the Hitler government.

The CHAIRMAN. Isn't it also the fact that not only cartel proceedings in the courts were required but also public hearing before the

[1] Arnold exhibit No. 18, p. 4858, pt. 11, Hearings of the Special Senate Committee Investigating the National Defense Program, 1942.
[2] Arnold exhibit No. 19, Ibid.

Digitized by Google

Truman committee before we could get the rubber patents into the production process?

Dr. HUNTER. I think that's a fair statement.

Mr. SCHIMMEL. Dr. Hunter, did those documents show whether a greater amount of research on buna-type rubber was being done in Germany than in America?

Dr. HUNTER. Unquestionably more of it had been done by I. G. Farben and its associates and the other companies in Germany than had been done in the Standard Oil set-up in this country. Now, if you mean were any companies in this country engaged in research, the answer is "Yes." Goodrich and Goodyear for years were engaged in very exhaustive research in attempting to develop the buna-types of rubber, and were trying all through those years, from 1931 to and after the outbreak of war, to get the permission of Standard Oil and I. G. Farben to participate in the development and exploitation of buna-type rubber that Farben developed, but they had no success; that is, the efforts to get participation were without success.

Mr. SCHIMMEL. Did any of these companies hold up their research in the hope they would be able to get technical information from the German companies according to the agreements you refer to?

Dr. HUNTER. I can't say whether they held up their research; I do know they were anxious to get whatever assistance they could from Standard Oil and I. G., and weren't able to get it.

The CHAIRMAN. Isn't it true that butyl was an American development?

Dr. HUNTER. That's right.

The CHAIRMAN. And that it was furnished quite freely to Germany while Farben at the same time was withholding from Standard the know-how on buna?

Dr. HUNTER. That's right.

The CHAIRMAN. Under the cartel butyl was a problem to get into development, although it was needed for gas masks and for various other necessary purposes, including inner tubes.

Dr. HUNTER. That's right.

The CHAIRMAN. Mr. Berge, will you please go ahead. I'm sorry for so many interruptions.

Mr. BERGE. In the case of the Bausch & Lomb-Zeiss cartel on military optical glass, the heads of the Bausch & Lomb department responsible for military research were to be appointed only with the agreement of Carl Zeiss of Jena, Germany. This is provided for in a contract dated December 24, 1926, which stated:

> In furtherance of the aims of this agreement, the Bausch & Lomb Optical Co. in Rochester will create a new department responsible solely to the board of directors, which is charged with the independent development of all scientific and technical tasks within the military scope and the maintenance of associations with the firm of Carl Zeiss in Jena. The parties will come to an agreement as regards the heads to be placed in charge of this department.

The CHAIRMAN. Mr. Berge, as I recall, there was a shortage of field glasse in the United States at the outbreak of this war and private citizens were asked to donate their filed glasses that we might get lenses for use by our Army and Navy in combat. This situation was brought about because of the failure of the development and production of an American company—Bausch & Lomb?

Digitized by Google

Mr. SCHIMMEL. Is Bausch & Lomb an American company or a German company?

Mr. BERGE. An American company in Rochester, N. Y.; Zeiss is the German company.

Mr. SCHIMMEL. But the German company dictated the research personnel of the American company?

Mr. BERGE. As I understand it, Mr. Schimmel, the German company had a veto power over who was to conduct research in our country.

In regard to the cartel involving Plexiglas, probably one of the most important plastics, and one which has innumerable military uses, the Röhm & Haas Co. of Philadelphia, a member of this cartel, stated:

* * * we could think of a price agreement on the finished product, or a division of our interests. I told him we have not only our own interests at stake but also the ones of our German house (Rohm & Haas of Darmstadt, Germany) and the I. G.

The CHAIRMAN. Do you have anything in your records with reference to the connection between Röhm & Haas of Philadelphia and Röhm & Haas of Darmstadt?

Mr. BERGE. Yes. Mr. Borkin will explain that.

Mr. BORKIN. Before the First World War—in fact, during the early part of the twentieth century—Röhm and Haas formed a partnership to exploit certain chemical processes in Germany. After a time, Mr. Haas came to the United States and formed a company here, also called Röhm & Haas, on the same basis as the German company was owned, or 50 percent each by Röhm and Haas. When the war broke out, that is, the First World War, the Alien Property Custodian seized the half owned by Dr. Röhm, so that we had the situation where the Alien Property Custodian and Haas owned the company. The Alien Property Custodian sold it to a chemical tanning firm of Chicago and after a few gyrations the ownership of that stock came back to Mr. Haas and then to Dr. Röhm, so that at the opening of this war it stood at the same position, practically, that it did at the start of the First World War, and I understand in this war again the Alien Property Custodian has seized a portion of the stock.

The CHAIRMAN. Plexiglas is the clear substance we used in the noses, sides, and tails of our planes?

Mr. BORKIN. It has a great advantage over glass because it is lighter and clearer.

The CHAIRMAN. And it is not subject to fragmentation; isn't that right?

Mr. BORKIN. That's right.

Mr. BERGE. To mention another one, the second largest producer of tungsten carbide, an essential machine tool ingredient, has testified, and I quote:

The control of the tungsten carbide patents by the General Electric Co. and the Krupp Co. has resulted in keeping the prices at exorbitant levels. Now when the emergency has come, industry has not learned how to use tungsten carbide and has not the machines, the skilled men, or the technique which it would have had if the material had been available at the same low prices at which it was available to German industries.[1]

[1] Lewin exhibit No. 3, p. 219, pt. 1, Hearings of the Senate Committee on Patents, 1942.

Digitized by Google

The CHAIRMAN. Do you recall the differences in those prices?

Mr. BERGE. Roughly, yes. I think it was around $50 in Germany and as high as $453 in the United States.

The CHAIRMAN. For the same substance?

Mr. BERGE. For the same substance; yes.

In December 1934 a high official of the du Pont Co. wrote to E. W. Webb, president of the Ethyl Corporation, with copies to every member of its board of directors, as follows:

I learned through our Organic Chemicals Division today that the Ethyl Gasoline Corporation has in mind forming a German company with the I. G. to manufacture ethyl lead in that country.

I have just had 2 weeks in Washington, no inconsiderable part of which was devoted to criticizing the interchanging with foreign companies of chemical knowledge which might have a military value. Such giving of information by an industrial company might have the gravest repercussions on it. The Ethyl Gasoline Corporation would be no exception, in fact, would probably be singled out for special attack because of the ownership of its stock.

It would seem, on the face of it, that the quantity of ethyl lead used for commercial purposes in Germany would be too small to go after. It has been claimed that Germany is secretly arming. Ethyl lead would doubtless be a valuable aid to military airplanes.

I am writing you this to say that in my opinion under no conditions should you or the board of directors of the Ethyl Gasoline Corporation disclose any secrets or "know-how" in connection with the manufacture of tetraethyl lead to Germany.[1]

Yet, in the face of this warning from du Pont, on January 12, 1935, Webb wrote the Chief of the Army Air Corps that—

There is no technical data of military importance known to us which would be involved in the building of such a plant that has not already received wide publicity, or is of common knowledge in the aviation field.[2]

This statement strikingly ignores the warning received from du Pont only 1 month earlier that such a disclosure would "doubtless" be prejudicial to our national security. In this connection it should not be overlooked that du Pont and Dow were the sole producers of the chemical components of tetraethyl lead and, as such, were the concerns which alone possessed the essential know-how.

Why did Ethyl Gasoline disregard du Pont's warning? Webb himself has supplied the answer in the final paragraph of the statement of facts accompanying his letter of January 12, 1935, mentioned above. He frankly stated that—and I quote:

There is, furthermore, an equally, if not more, important business aspect to the German situation. We are owned by the Standard Oil Co. (New Jersey) and General Motors Corporation in equal shares. General Motors has important investments in Germany, producing there in excess of 50 percent of the motor cars. Standard Oil (New Jersey) has large investments in all phases of the petroleum business in Germany. * * * We feel * * * for the reasons specifically mentioned here, that it would be extremely unfortunate for all concerned if we do not proceed to carry out the agreement with I. G. * * * A refusal or undue delay on our part * * * might bring on some serious reprisal measures.[2]

This leaves nothing for surmise. It is not unfair to conclude, in view of these facts, that for the directors of Ethyl Gasoline the preservation of I. G. goodwill conflicted with the maintenance of good faith in dealings with their own Government. Though du Pont, from the beginning, was opposed to the entire deal on grounds of patriotic

[1] Exhibit No. 144 on p. 939.
[2] Exhibit No. 145 on p. 939.

Digitized by Google

scruples, nevertheless it eventually deferred. In an interoffice memo of the du Pont Co. appears the following:

* * * I think we should tell I. C. I.—

that is, the Imperial Chemicals of England—

that the technical and engineering information which we are giving I. G. in connection with tetraethyl lead is being given them entirely at the request of the Ethyl Gasoline Corporation. As they no doubt know, Ethyl Gas and I. G. set up some arrangements whereby they are going to participate jointly in the manufacture and sale of ethyl lead in Germany and we are turning over our information to Ethyl Gas which they in turn can submit to I. G. as part of the bargain in connection with this joint enterprise.[1]

The CHAIRMAN. Now, Mr. Berge, do I understand that an American corporation and I. G. Farben were joint owners of the plants for making tetraethyl gasoline, for making aviation gasoline for use by the Luftwaffe, and that that is what is enabling them to continue the fight in Germany?

Mr. BERGE. It's certainly one of the things; yes, sir.

I offer this chart for the record.

(The chart referred to was received in evidence and marked "Exhibit No. 154" and was held in committee files.)

Dr. HUNTER. Mr. Senator, that chart shows the rather complicated arrangement that has been worked out, by which American and British interests participated in ownership with I. G. in Germany in the tetraethyl lead production facilities of Germany. An American company, called the Forak Co., is the direct participant.

Mr. BERGE. Even the admonitions of the War Department sometimes have little effect upon a cartel member when the latter finds itself torn between national duty on the one hand and cartel obligations on the other. In a letter of July 9, 1929, from the Bausch & Lomb Optical Co. in Rochester, N. Y., to its German associate, appears the following:

Heretofore, the Government has merely been insistent that none of the details as regards the designs of these instruments be made public, but lately it seems as if the quantities, prices, etc., and the amount of the equipment purchased, etc., are also considered secret. Obviously, our agreement with Messrs. Carl Zeiss cannot work satisfactorily unless, at least the latter information, becomes common knowledge to both parties, but some arrangements must be made whereby we are assured this information will be kept in strictest confidence.

The statement accompanying this letter covers deliveries during the months mentioned of various articles such as antiaircraft range finders, 26½-foot range finders, periscopes, and telescopes.

The CHAIRMAN. Now, that was given directly to Germany; military information of the United States was given directly to Germany through a manufacturing company manufacturing war instruments; was it not?

Mr. BERGE. That's right.

The full extent of the dilemma in which cartel members are placed by the conflict of their cartel commitments with national interest is indicated in two statements made by a representative of one of the

[1] Exhibits Nos. 146, 147, 148 on pp. 942, 943, 944.

Digitized by Google

world's great industrial combines. In a letter written in 1939 after the outbreak of war it is stated:

> Pursuant to these arrangements I was able to keep my appointments in Holland, where I had 3 days of discussion with the representatives of the I. G. They delivered to me assignments of some 2,000 foreign patents and we did our best to work out complete plans for a modus vivendi which would operate through the term of the war, whether or not the United States came in. All of the arrangements could not be completed, but it is hoped that enough has been done to permit closing the most important uncompleted points by cable. It is difficult to visualize as yet just how successful we shall be in maintaining our relations through this period without personal contacts.[1]

Mr. SCHIMMELL. Who wrote that letter?

Mr. BERGE. Frank Howard, president of the Standard Oil Development Co.

The CHAIRMAN. Was that meeting in Holland designed for the purpose of preventing the Alien Property Custodian of the United States seizing these German patents as a war measure?

Mr. BERGE. I don't think it would be unfair to infer that.

The CHAIRMAN. It was a means of getting around the law which makes enemy-owned patents susceptible to seizure by our Government in wartime?

Mr. BERGE. That certainly can be inferred.

The CHAIRMAN. Farben went into Liechtenstein at the outbreak of the war. Liechtenstein has assiduously kept neutral. Farben incorporated a lot of their companies and vested title in the patents to try to prevent seizure by foreign countries—also as a part of their modus operandi.

Mr. BERGE. I think it is also significant that this same representative, Mr. Howard, brilliantly expressed the cartel point of view when he said:

> Upon completion of that agreement, the war intervened because our grouping of interested parties included Americans, British, Dutch, Germans, and the war introduced quite a number of complications. *How we are going to make these belligerent parties lie down in the same bed isn't quite clear as yet.* We are now addressing ourselves to that phase of the problem and I hope we will find some solution.
>
> *Technology has to carry on—war or no war*—so we must find some solution to these last problems. [Italics supplied.][2]

Illustrative of cases exhibiting restrictions on the practical application of technological advances is the limitation imposed upon magnesium production in the United States by the 1931 cartel agreement between the Aluminum Co. of America and I. G. This consortium (called the Alig agreement) was designed to fund all patents and know-how relating to the art of magnesium production and fabrication in a jointly owned company, which directly or through licenses was to exploit these techniques exclusively in the United States and not elsewhere. The Magnesium Development Corporation was formed shortly thereafter for this purpose. One of the provisions of the basic Alig agreement reserved to I. G. the sole right to fix, in its

[1] Exhibit No. 368, p. 4584, pt. 11, Hearings of the Special Senate Committee Investigating the National Defense Program, 1942.

Digitized by Google

discretion, the maximum output of magnesium, whether manufactured by Magnesium Development Corporation itself or under license granted for its territory, i. e., the United States, beyond or above 4,000 tons per year. In other words, Alcoa might participate on a 50-50 basis (which represented the relative shareholding of the two parties in Magnesium Development Corporation) in any decision in respect of the amount of magnesium to be produced in this country so long as the output remained less than 4,000 tons annually. But, if it were a question of expansion of capacity beyond 4,000 tons, I. G. alone was to make the decision. This is made clear in a stipulation in the Alig agreement, which reads as follows:

As long as magnesium is produced by any * * * producing company under a license or licenses granted * * * the holders of the I. G. shares in Alig * * * shall have the right to limit the increases in production capacity of every such producing company after the initial contemplated production capacity shall have been reached. The initial contemplated capacity *shall in no case be more than 4,000 tons per annum.*[1]

The CHAIRMAN. In other words, even though our needs might be the greater, we had to procure the consent of the Government-controlled I. G. Farben monopoly in Germany before we could increase that production?

Mr. BERGE. Right. We couldn't go above 4,000 tons unless I. G. agreed.

It may be stated almost as a law of their nature that cartels restrict the fullest development of new products, and that they attempt to place rigid handicaps on output. Very often they even adulterate the quality of products in order to exact the greatest possible toll from the public.

Several examples may be used to indicate the practices and mental attitude of monopoly groups in relation to the quality of material. The following quotation concerning flashlight bulbs, speaks for itself:

Two or three years ago we proposed a reduction in the life of flashlight lamps from the old basis on which one lamp was supposed to outlast three batteries, to a point where the life of the lamp and the life of the battery under service conditions would be approximately equal. Sometime ago, the battery manufacturers went part way with us on this and accepted lamps of two battery lives instead of three. This has worked out very satisfactorily.

We have been continuing our studies and efforts to bring about the use of one battery life lamps. I think you will be interested in the attached analysis which Messrs. Prideaux and Egeler have worked up covering the various points involved in going to the one battery life basis. If this were done, we estimate that it would result in increasing our flashlight business approximtely 60 percent. We can see no logical reason either from our standpoint or that of the battery manufacturer why such a change should not be made at this time.

Messrs. Parker and Johnson now have this matter up with the battery manufacturers and I would urge that every assistance be given them to put it over.

The CHAIRMAN. In other words, the agreement was to deteriorate the quality of a flashlight bulb so that when you used up the charge in one battery, everything except the shell became useless and you had to buy a new battery and new lamp and practically rebuild your flashlight.

Mr. BERGE. That's it.

Mr. SCHIMMEL. From what company's files did this correspondence come?

[1] Arnold exhibit No. 13, pp. 1036, 1043, pt. 2, Hearings of the Senate Committee on Patents, 1942.

Digitized by Google

Mr. BERGE. This comes from General Electric.

Although the following plan may not have been placed in actual effect, we can gain some insight into the shocking extremes to which monopolists will even consider going. Methyl methacrylate is the name of one of the best known plastics. It is used not only in the industrial field to make airplane windshielding and many other structural materials, but it also has excellent qualities for the making of dental plates or dentures. As a result of the monopoly control of this material by the du Pont Co. and Röhm & Haas of Philadelphia, its uses were divided into two fields—industrial and dental. At the time these firms were indicted a sharp difference in price was maintained. When methyl methacrylate was sold for industrial purposes, it cost 85 cents a pound, while the price to dental users was $45 a pound. The dental profession soon learned that there was no difference in the material, whether it was designed for industrial or dental use. As a result they began to purchase their requirements from industrial users, in order to gain the advantage of the cheaper industrial price which, we could assume, might possibly be passed on to the dental patient—at least in part.

The monopoly group considered this a form of bootlegging. The Vernon-Benshoff Co., a member of the monopoly clique, made a suggestion in a letter dated March 15, 1940, which I quote below:

> Our discussion of the Pure Food and Drug law and pulling the acrylic denture under it leads me to wonder if the manufacturers of the commercial molding powders might not add an ingredient which would not affect the molding properties, but which would disqualify it under the act—

that is, the Pure Food and Drug Act.

> Apparently a slight trace would suffice. Naturally it would be omitted from the strictly denture powder.
>
> Recently I asked Dr. Johnson to suggest an addition which might interfere with distillation of monomer or retard polymerization. He could not think of anything that wouldn't spoil the molding properties or clarity of the powders. But there the quantity needed to accomplish the result was the handicap.
>
> Under the very finicky regulations of the above act, however, it may be the slightest trace of the right agent, too little to constitute harm to molding (or health either as a matter of fact) would suffice to have bootleg products in bad.
>
> A millionth of 1 percent of arsenic or lead might cause them to confiscate every bootleg unit in the country. There ought to be a trace of something that would make them rear up.[1]

The CHAIRMAN. They were suggesting putting poison into the commercial powders that might possibly endanger human life if used in a denture?

Mr. BERGE. That's right.

The CHAIRMAN. Wouldn't you say they wanted to put the inspectors of the Pure Food and Drug Division to work to see that the dentures were sold at $45 a pound instead of 85 cents a pound?

Mr. BERGE. The effect would have been to make the Food and Drug Act inspectors policemen to enforce the price differentials they were making on this product between commercial and dental users.

The CHAIRMAN. Of course, there would be no factual reason for this price differential?

Mr. BERGE. None that I can see.

---

[1] Exhibit No. 149 on p. 947.

Digitized by Google

The Röhm & Haas Co. said in its reply that they were in agreement with the general principles presented in the letter of the Vernon-Benshoff Co., and that they would turn their research department to work on the matter. This is expressed in a letter of March 21, 1940, to the Vernon-Benshoff Co.

In reference to your letter of March 15th, we shall be glad to investigate whether denture materials come under the Pure Food and Drug Act. We agree with you that if we could put some ingredient in our commercial molding material which would disqualify it under the Pure Food and Drug Act, this would be a very fine method of controlling the bootleg situation. We shall take this matter up with our development department and advise you whether any such material could be used.[1]

The CHAIRMAN. What general type of ingredient would disqualify it under the Pure Food and Drug Act, taking the proper interpretation of the Pure Food and Drug Act?

Mr. BERGE. I am no scientist, but I suppose arsenic certainly would do it, or anything poisonous or injurious.

The CHAIRMAN. Would it have to be something that is injurious to health?

Mr. BERGE. I presume it would because I suppose the object of the Pure Food and Drug Act is to protect health against deleterious substances. If it wasn't of that nature, I suppose it wouldn't contravene the Pure Food and Drug Act.

Mr. SCHIMMEL. The word "bootleg" is used. We usually think of bootlegging as an illegal activity. Was there anything illegal about the dentist using commercial plastics?

Mr. BERGE. Of course not, but the monopolist or cartelist thinks of the maintenance of his artificial price structure as a private law and those who violate that private price structure are, in his view, bootleggers.

The CHAIRMAN. That is the difference between the operation of private law and public law.

Mr. BERGE. Except that they'd like to have the public authorities enforce their private law, whereas the public doesn't expect private police to enforce its laws.

A striking way in which research can be perverted is illustrated by another example. The dyestuffs industry is one which is basically monopolistic and cartelized. A tight grip is maintained over its price structure. This is especially true of dyestuffs for textiles. Recently the du Pont research laboratories developed a pigment which can be utilized either in paints or as a dye for textiles. The du Pont research laboratories considered various ways to be sure that the pigment could be limited in use to the paint and finishing field so as not to disturb the price structure of the textile dyestuffs field. The trend of du Pont's research thought on this subject was stated by the director of one of du Pont's laboratories:

* * * Further work may be necessary on adding contaminants to "Monastral" colors to make them unsatisfactory on textiles but satisfactory for paints.

After working on this problem for some time, the Jackson Laboratory of the du Pont Co. reported its progress on this research problem. Du Pont says of Jackson Laboratory that it is "one of the largest organic chemical research laboratories in the world." This particular

[1] Exhibit No. 150 on p. 947.

Digitized by Google

task was difficult, according to a report by the Jackson Laboratory dated June 26, 1940, from which I quote:

* * * Mr. Chatler was of the opinion that pigment mixtures unsuitable for textile printing would be very difficult to obtain.

(B) The suggestion was made that certain compounds that were white under ordinary conditions but that would be oxidized to give colored bodies when the prints are subjected to chlorine bleach could be used. A few experiments had been made along this line using such compounds as Chlorostain N, dianisidine, and du Pont Oxy Black Base. Complete data on this work are not available. Mr. Dahlen expressed the opinion that the addition of such compounds probably would cause as much or more damage to the paint trade as to textile printing.

Such substances as ground glass and carborundum were suggested for incorporation with the pigment. While these materials would undoubtedly scratch printing rolls, there is considerable doubt as to their effect in paints and lacquers.[1]

Two days later the problem was again attacked at a meeting between the representatives of General Aniline Works and the du Pont Co. Eight possible methods of adulteration were considered. I quote a few from the confidential memorandum of their discussion:

1. A new type of copper phthalocyanine (CPC) for the paint and lacquer trade which would be unsuitable for application on textiles.

* * * * * * *

The importance of solving these problems was recognized and it was agreed that both parties would work on promising ideas which resulted from this discussion. The three problems are closely related and it is possible that the solution of one or two will automatically solve the third. It was agreed that a powder would be the preferable standard. After detailed discussion of various modes of attack, the following appeared to be outstanding:

1. (*a*) Mixtures of CPC with lakes—The most promising mode of attack appears to lie in the formulation of a mixture of CPC with a lake, especially a lake of CPC. Such a mixture should have fairly good fastness to light and *yet be poor in wash fastness on textiles* or incompatible with the usual textile printing lacquers.

* * * * * * *

(*d*) *Deteriorate cotton.*—Compounds might be incorporated into CPC which when applied to textiles and followed by bleaching or heating treatment *might increase the deterioration of the cloth.* Compounds such as chlorates or aliphatic halides which would produce hydrochloric acid were specific examples.

* * * * * * *

(*g*) *Irritating substances.—It is known that certain resins and solvents are irritating to the skin, often causing dermatitis. It might be possible to formulate a CPC composition which will make textile materials irritating to the skin.* [Italics supplied.]

The CHAIRMAN. These great laboratories were seriously considering the possibility of spreading the itch in order to maintain their price structure?

Mr. BERGE. That's right.

The CHAIRMAN. Please go on.

Mr. BERGE. I am continuing to quote:

(*h*) *Incorporation of grit.*—It seemed too dangerous to attempt to add gritty material to CPC since, although it would interfere with the use of the material for textiles, it would also offer serious disadvantages in grinding on application of surface coatings.

It was agreed that the mere dulling of the material would not be a satisfactory solution since dull shades are often used in the textile trade. Most of the above comments were based on work on blue, and many of the solutions would apply equally well to the green. In fact it is believed that there is a larger market for the sale of green than the blue.[2]

[1] Exhibit No. 151 on p. 947.
[2] Exhibit No. 152 on p. 949.

Digitized by Google

So that shows some of the points they were trying to solve in order to maintain the price structure of the pigment used in the painting trade and textile printing.

Mr. SCHIMMEL. Was this discussion and research going on after the national emergency was declared?

Mr. BERGE. June 26, 1940.

Mr. SCHIMMEL. Then this evidence would show that one of the largest organic research companies of the world was concerned with these trivial problems after the national emergency was declared.

Mr. BERGE. That would seem to be correct. These are from memoranda in their files.

I think we must certainly conclude that we cannot afford as a Nation to place our sole reliance upon monopolistic corporations whose interests have only too often been divided, who have sought restricted production rather than full employment of our resources and labor, and who have sought for monopoly control rather than public welfare. We must learn by the bitter lessons of the early years of this war which found us lacking both materials and the know how to make them, resulting from the restrictive practices of monopolies which instinctively seek to produce as little as possible for the greatest profit.

There are those who scoff at all mention of cartels and refer to them as bogies conjured up to justify an attack on all business. Such an attitude is dangerous. Cartels present the greatest challenge to our system of free enterprise. The Antitrust Division is well aware of the difficulties which lie ahead in this connection.

It is fortunate indeed that the present Government of Great Britain may be expected to take a different attitude toward the cartel problem than that which was taken in the days of the appeasers. The peace of Munich has received its full measure of public consideration. Not so well know but of great importance was the peace of Dusseldorf. Unfortunately, this has been the subject of little public comment. It is important to know about the peace of Dusseldorf because it epitomizes the spirit and power of industrial monopoly in the world.

The conference of Dusseldorf took place on March 15 and 16, 1939, immediately after Hitler's invasion of Czeschoslovakia on March 14. The conference consisted of delegates from the Reichsgruppe Industrie of Germany and from the Federation of British Industries. These two groups represent a substantial portion of German and British industry. At the conclusion of the conference the delegates issued the following text of a joint declaration.

The Reichsgruppe Industrie and the Federation of British Industries, having concluded a general discussion on Anglo-German trade relations, issue the following agreed statement:

1. The two organizations welcome the opportunity which these discussions have given of developing still further the friendly relations which have existed between the two bodies for so many years.

* * * * * * *

4. The two bodies are agreed that the objective to be attained is that the export of all countries should be conducted in such a way as to insure a fair return for the producers of those countries. Hence it is agreed that it is essential to replace destructive competition wherever it may be found by constructive cooperation, designed to foster the expansion of world trade, to the mutual benefit of Great Britain, Germany, and all other countries.

Digitized by Google

5. The two organizations are agreed that it is desirable that individual industries in both countries should endeavor to arrive at industrial agreements which will eliminate destructive competition, wherever occuring, but prices must be fixed at such a level as not to diminish the buying power of the consumers.

6. The two organizations realize that agreements upon prices or other factors between Germany and Great Britain are only a step, although a most important step, toward a more ordered system of world trade. They would welcome the participation of other nations in such agreements.

Mr. SCHIMMEL. Mr. Berge, is this an agreement between Great Britain and Germany, or private parties in Great Britain and Germany?

Mr. BERGE. Private parties. I might tell you a little about these two groups. I have here a brief statement:

Reichsgruppe Industrie is the official organization of German industry. Membership is compulsory for all industrial enterprises under the law of 1934. It is one of the seven groups of the German Economic Chamber. The present Reichsgruppe Industrie is the successor to the National Federation of German Industries which existed from 1917 to 1934.

Well, it was, so far as Germany is concerned, a state-sponsored organization.

The CHAIRMAN. It would correspond, shall we say, to N. A. M., if it were compulsory for industry to belong to N. A. M.?

Mr. BERGE. Yes.

The CHAIRMAN. In other words, an association of manufacturers is a voluntary grouping in the United States, but if we passed a law saying every industrial establishment had to belong to that association and elect delegates, we would have something similar to the Reichsgruppe.

Mr. SCHIMMEL. And it would be part of the Department of Commerce.

Mr. BERGE. The British party to this agreement, the Federation of British Industries, is a voluntary organization of large British industrial concerns and trade associations. It is, according to its official pronouncement, the largest association of manufacturers in the world. I shall continue quoting:

8. The two organizations realize that in certain cases the advantages of agreements between the industries of two countries or of a group of countries may be nullified by competition from the industry in some other country that refuses to become a party to the agreement. In such circumstances it may be necessary for the organizations to obtain the help of their governments and the two organizations agree to collaborate in seeking that help.

The CHAIRMAN. What other countries do you suppose these British and German gentlemen were thinking of in that connection?

Mr. BERGE. I certainly don't think that takes much imagination, and moreover it was interpreted expressly in the critical British press to mean us. I can refer here to an extract from the London Economist of that period, in which, after considerable discussion of this agreement, it is stated:

The United States is one country that would be most unlikely to "become a party to the agreement." The clause consequently means that in given circumstances the Federation of British Industries contemplates seeking British Government subsidies to help German trade against American. Is there something in the atmosphere of Dusseldorf that causes sensible men to lose their wits?

Digitized by Google

The CHAIRMAN. In other words, the British press and the British people were not favorable to such an agreement. It was merely a group of industrialists; it was not the attitude of the people of England.

Mr. BERGE. That's what the London Economist indicates.

Mr. SCHIMMEL. I presume the German-controlled public press was favorable to it.

Mr. BERGE. I am sure they were. To continue to read:

9. The two organizations agree that it is their objective to ensure that as a result of an agreement between their industries unhealthy competition shall be removed. Their aim is to secure as complete cooperation as possible throughout the industrial structure of their respective countries.

I interpolate that our experience in the Antitrust Division through the years clearly shows that persons whose minds run in these channels always regard as unhealthy any competition which they can't beat out. Price cutting is unhealthy competition in their view; butting into territory which they regard as exclusively their own is unhealthy in their view; and the violation by their members of any fixed agreements to preserve monopolistic positions is unhealthy in their view. The interference of outsiders is unhealthy competition in their view.

Now, item 10 is this:

10. The two organizations have agreed to use their best endeavors to promote and foster negotiations between individual industries in their respective countries. They are encouraged in this task owing to the fact that a considerable number of agreements between individual German and British industrial groups are already in existence. There is thus available a large body of experience which inspires confidence that an immediate extension of this policy is both practicable and advantageous.

They are glad to state that approximately a further 50 industrial groups have already signified their willingness in principle to negotiate at an early date.

They also report with satisfaction that negotiations have already been started and are now taking place between 10 industrial groups.

The spirit exemplified in the above declaration is not dead. It is awaiting the moment of peace to step in and resume control of those very industries which are most essential to the rehabilitation of a war-torn world, to the fullest use of our labor and resources. If this spirit is permitted to continue it will sow the seeds of World War No. 3.

In every cartel arrangement which has come to the attention of the Antitrust Division technology has been a vital factor. It is the responsibility of government to see that technology remains free from artificial control and monopoly perversion.

The CHAIRMAN. Now, Mr. Berge, I realize in your official capacity you cannot give an opinion on a bill or principle or policy, but speaking as just Wendell Berge, would you care to express any opinion on the principle behind Senate 702, which is the bill under discussion here?

Mr. BERGE. I'll be glad to do that, Senator. I think the conclusion inevitably follows, from what I have stated this morning and from other facts that we expect to introduce at later hearings, that we can't continue to allow private monopolies and cartels to bottle up science, to bottle up research, for their own private profit alone without regard to the national public interest. Certainly there must be some kind of legislation which will put an end to the kind of abuses I have

Digitized by Google

discussed, and which will furnish positive, affirmative assistance to the development of research outside the particular fortified area occupied by these monopolies and cartels. Certainly one method which deserves most serious consideration is that of providing for the creation of a public research agency which can plan and develop and encourage scientific research from the standpoint of the public interest. Certainly such an important field as technological development cannot be left entirely to the whims of monopolies.

I should suppose that vigorous antitrust enforcement can do much to curb the abuses of which I have spoken and that some such measure as S. 702 can provide the constructive direction and encouragement that is needed to develop technology from the national standpoint.

I haven't made a sufficient study of the specific provisions of this present bill to give a final opinion as to whether in its present form it fully meets the situation, but it does seem to me that some such legislation as this is certainly needed, and that at these hearings progress will be made in developing the particular provisions that may be desirable.

In general, it seems to me that S. 702 points in the right direction. I might say that at later hearings I want to further develop certain aspects of these problems as they appear from the vantage point of the Antitrust Division. I hope to develop facts showing how the quasi-public research foundation has permitted itself to be prostituted to serve the purpose of selfish monoply groups. I also expect to present the case history of one cartel alone which contains within itself practically every objectionable cartel feature, a cartel which in itself is a microcosm of all these evils. I hope also to show how monoply control has prevented new and better war materials from being developed and adopted ~~in~~ certain fields.

Now, there is one item, if I could beg your indulgence for just a moment, that I intended to mention as I went along, although it perhaps doesn't directly relate to the technological restraint, but I think it is pertinent because it shows how monopoly control of an industry works against our interests in wartime.

There is a misconception, generally, I believe, in the public mind that transportation rates are fixed by public regulatory authority. Of course, we know that that is not so, that the tariff that is challenged to the extent that it becomes reviewed by public regulatory authority is exceptional, and that for every one that is passed on there are hundreds, probably thousands, that are simplified and become operative, and we know that rates on public transportation are, for the most part, fixed by the industry itself and often by agreement.

Here is a report or an excerpt from a report dated July 12, 1938, from the Western Commissioner to the members of the Committee of Directors for Commissioner Plan. That's a plan—it existed until this April.

This relates to reduced rates on wheat donated for distribution in China, and the excerpt states:

> At the last meeeting of the association, I advised of information reaching me regarding a movement to secure pledges to cover a minimum shipload of wheat to move the latter part of August for distribution to the common people in China, the wheat to be donated by the farmers and grain men of Texas, Oklahoma, and Kansas, and stated that question had been raised as to whether or not it would be possible to get the railroads to move this wheat to ports at less than published tariff rates.

Digitized by Google

So that shows some of the points they were trying to solve in order to maintain the price structure of the pigment used in the painting trade and textile printing.

Mr. SCHIMMEL. Was this discussion and research going on after the national emergency was declared?

Mr. BERGE. June 26, 1940.

Mr. SCHIMMEL. Then this evidence would show that one of the largest organic research companies of the world was concerned with these trivial problems after the national emergency was declared.

Mr. BERGE. That would seem to be correct. These are from memoranda in their files.

I think we must certainly conclude that we cannot afford as a Nation to place our sole reliance upon monopolistic corporations whose interests have only too often been divided, who have sought restricted production rather than full employment of our resources and labor, and who have sought for monopoly control rather than public welfare. We must learn by the bitter lessons of the early years of this war which found us lacking both materials and the know how to make them, resulting from the restrictive practices of monopolies which instinctively seek to produce as little as possible for the greatest profit.

There are those who scoff at all mention of cartels and refer to them as bogies conjured up to justify an attack on all business. Such an attitude is dangerous. Cartels present the greatest challenge to our system of free enterprise. The Antitrust Division is well aware of the difficulties which lie ahead in this connection.

It is fortunate indeed that the present Government of Great Britain may be expected to take a different attitude toward the cartel problem than that which was taken in the days of the appeasers. The peace of Munich has received its full measure of public consideration. Not so well know but of great importance was the peace of Dusseldorf. Unfortunately, this has been the subject of little public comment. It is important to know about the peace of Dusseldorf because it epitomizes the spirit and power of industrial monopoly in the world.

The conference of Dusseldorf took place on March 15 and 16, 1939, immediately after Hitler's invasion of Czeschoslovakia on March 14. The conference consisted of delegates from the Reichsgruppe Industrie of Germany and from the Federation of British Industries. These two groups represent a substantial portion of German and British industry. At the conclusion of the conference the delegates issued the following text of a joint declaration.

The Reichsgruppe Industrie and the Federation of British Industries, having concluded a general discussion on Anglo-German trade relations, issue the following agreed statement:

1. The two organizations welcome the opportunity which these discussions have given of developing still further the friendly relations which have existed between the two bodies for so many years.

* * * * * * *

4. The two bodies are agreed that the objective to be attained is that the export of all countries should be conducted in such a way as to insure a fair return for the producers of those countries. Hence it is agreed that it is essential to replace destructive competition wherever it may be found by constructive cooperation, designed to foster the expansion of world trade, to the mutual benefit of Great Britain, Germany, and all other countries.

Digitized by Google

5. The two organizations are agreed that it is desirable that individual industries in both countries should endeavor to arrive at industrial agreements which will eliminate destructive competition, wherever occuring, but prices must be fixed at such a level as not to diminish the buying power of the consumers.

6. The two organizations realize that agreements upon prices or other factors between Germany and Great Britain are only a step, although a most important step, toward a more ordered system of world trade. They would welcome the participation of other nations in such agreements.

Mr. SCHIMMEL. Mr. Berge, is this an agreement between Great Britain and Germany, or private parties in Great Britain and Germany?

Mr. BERGE. Private parties. I might tell you a little about these two groups. I have here a brief statement:

Reichsgruppe Industrie is the official organization of German industry. Membership is compulsory for all industrial enterprises under the law of 1934. It is one of the seven groups of the German Economic Chamber. The present Reichsgruppe Industrie is the successor to the National Federation of German Industries which existed from 1917 to 1934.

Now, there is one item, if I could beg your indulgence for just a moment, that I intended to mention as I went along, although it perhaps doesn't directly relate to the technological restraint, but I think it is pertinent because it shows how monopoly control of an industry works against our interests in wartime.

There is a misconception, generally, I believe, in the public mind that transportation rates are fixed by public regulatory authority. Of course, we know that that is not so, that the tariff that is challenged to the extent that it becomes reviewed by public regulatory authority is exceptional, and that for every one that is passed on there are hundreds, probably thousands, that are simplified and become operative, and we know that rates on public transportation are, for the most part, fixed by the industry itself and often by agreement.

Here is a report or an excerpt from a report dated July 12, 1938, from the Western Commissioner to the members of the Committee of Directors for Commissioner Plan. That's a plan—it existed until this April.

This relates to reduced rates on wheat donated for distribution in China, and the excerpt states:

> At the last meeeting of the association, I advised of information reaching me regarding a movement to secure pledges to cover a minimum shipload of wheat to move the latter part of August for distribution to the common people in China, the wheat to be donated by the farmers and grain men of Texas, Oklahoma, and Kansas, and stated that question had been raised as to whether or not it would be possible to get the railroads to move this wheat to ports at less than published tariff rates.

Digitized by Google

It was the sense of the meeting that the railroads are not financially able to grant reductions in freight rates, and resolution was therefore unanimously adopted, reading as follows:

"*Resolved*, That no reductions from normal tariff rates be authorized in Western territory for movement of wheat to ports intended for charitable distribution to the common people in China."

This resolution was adopted by the Western Association of Railroad Executives at its meeting next preceding July 12, 1938, a meeting of railway competitors at which this question of whether or not rate reductions should be made to accommodate this shipment of wheat for charitable purposes should be granted, was discussed.

As to whether the reason given was a sufficient one or not, it is not my province to express an opinion, but the point is that here was a decision on a question vitally affecting public policy, vitally affecting the movement of wheat pursuant to a Government policy for use in China, that was made by a meeting of private competitors by agreement, and there wasn't any public authority present to pass upon it, nor was it later passed upon.

Now, if I may say one further thing on this general problem—have I expressed myself sufficiently, Senator, on the bill itself?

The CHAIRMAN. I wanted to ask you one question on that phase. As you well know, the Alien Property Custodian now has, I believe, some 36,000 seized patents and formulae, and while this is not authentic, I was told yesterday that a sale of a group of these had been contemplated but due to the temper of the present Congress and the Department of Justice the people contemplating purchase decided not to go ahead with the deal for a while yet at least. Now, we have spent enormous sums of money in the leasing of big laboratories, in our own laboratories, in the employment of scientists, and the purchasing of equipment, and have developed a lot—and I say that advisedly—great numbers of almost revolutionary formulae and processes as a result of this war. If these should get into the hands of the small group of these cartel owners or former cartel participants who expect to renew their cartels, as they stated before the Truman committee, as soon as the war is over, and rather expect to hold them in abeyance pending completion of the war, what would be the effect on American industry as a whole with these competitions, and would it not place foreign countries in even better position industrially than we would be?

Mr. BERGE. I think it would certainly give them a vast advantage, and I think it would be very disadvantageous to our own people.

The CHAIRMAN. And these millions spent by the taxpayers in this country would really redound to the benefit of the foreign countries.

Mr. BERGE. It certainly looks as though it would work out that way.

The CHAIRMAN. In other words, those that were price saving, that would cut the cost of living, would not be permitted to go ahead, and, as in the case of the flashlight matter, the price would be stepped up, with the life cut down, under such agreement.

Mr. BERGE. That is right.

The CHAIRMAN. I have one other question, Mr. Berge. What is your intention, the intention of your Department, with reference to American companies who desire to go along with that federation of British industries and the Reichsgruppe arrangement at Dusseldorf, or do you have any announced intentions on that?

Digitized by Google

Mr. BERGE. We certainly have. I intend to prosecute them, whenever these activities are discovered by our staff and the evidence comes to our hands indicating these activities which fix prices, restrict production, allocate territories, restrict technological development, or accomplish any of the other things forbidden by the antitrust laws, and I would intend to have prosecution whether the participants are American companies or foreign companies. Many of these international cartel agreements and practices which are contrary to our public interest are violative of the Sherman Act without question.

The CHAIRMAN. To get it down to the man on the street, a lot of these cartels are just as much a violation of law as was the manufacture and sale of liquor during prohibition, and as the conspiracy to manufacture and sell narcotics, and other violations of law. We have the law of the land that prohibits that sort of thing, and those are in violation of the law of the land. Isn't that right?

Mr. BERGE. Absolutely. It is true that up to a few years ago we didn't have an organization that was in any way adequate to enforce the Sherman Act. In the last few years we have had an organization which at least has been able to accomplish some things, although we haven't been able, I think, to do all the things that should have been done or that ought to be done in the future to stop these abuses.

Many of these practices which have been discussed today have been uncovered only since the Antitrust Division became active 4 or 5 years ago, and as was apparent from the dates on these documents, they related to activities which in many cases had been going on for many years because there hadn't been any adequate antitrust enforcement.

For the future, I believe that vigorous enforcement of the antitrust laws can do much to break up illegal arrangements now in effect between American corporations and foreign companies. I also believe that vigorous antitrust enforcement during the present and early postwar periods should have the effect of serving notice to cartel-minded foreign industries that when they deal with American companies they will have to observe our antitrust laws.

I think that from the standpoint of American business, its balance of interest is far on the side of keeping out of international agreements which contain restrictive features such as were involved in some of the transactions which I have discussed this morning. In any event, I think it is only fair to say that while I am head of the Antitrust Division, every available legal sanction under the antitrust laws will be applied against domestic and foreign companies when we have evidence that they are violating antitrust laws. By so doing, I think we can accomplish a great deal to free technological development from some of the shackles that these cartels have imposed upon it. I am confident we can institute enough suits to stop some of these practices and serve notice on foreign cartels as well as our own that antitrust violations will not be tolerated.

I hope at these future hearings to supply some more facts that may be pertinent to this bill.

The CHAIRMAN. If it will be convenient for you to come back next Thursday morning at 10:30, October 21, we could hear them.

Mr. BERGE. I think it would. We are preparing some material for the next hearing. I think we can be ready Thursday.

The CHAIRMAN. That's fine.

Digitized by Google

Mr. BERGE. One more thing. It may be too bulky to reprint as part of the record of these hearings, but I am going to offer in evidence a copy of the study on cartels made by Dr. Corwin Edwards of our staff. I understand that this study is one of those subpenaed. It is material and I think would be of great interest to the committee.

(The study referred to was received for separate publication as a monograph of the subcommittee.)

The CHAIRMAN. We will recess, then, until next Thursday at 10:30 a. m.

(Whereupon, at 11:50 a. m., the hearing adjourned, to reconvene at 10:30 a. m., Thursday, October 21, 1943.)

Digitized by Google

SCIENTIFIC AND TECHNICAL MOBILIZATION

THURSDAY, OCTOBER 21, 1943

UNITED STATES SENATE,
COMMITTEE ON MILITARY AFFAIRS,
SUBCOMMITTEE ON WAR MOBILIZATION,
Washington, D. C.

The subcommittee met at 10:10 a. m., pursuant to adjournment on Friday, October 15, 1943, in room 104, Senate Office Building, Senator Harley M. Kilgore, West Virginia (chairman), presiding.

Present: Senator Harley M. Kilgore, West Virginia (chairman); Senator Rufus C. Holman, Oregon.

Also present: Herbert Schimmel, chief investigator, and John M. Jacobsen, consultant.

The CHAIRMAN. The committee will come to order.

Wendell Berge, of the Department of Justice, Assistant Attorney General, will continue with the testimony which he started on last Thursday.

Mr. Berge, I wish you would go right ahead with your testimony on the same line that you left off last Thursday.

TESTIMONY OF HON. WENDELL BERGE, ASSISTANT ATTORNEY GENERAL OF THE UNITED STATES

Mr. BERGE. Yes, Mr. Chairman.

I am going to review today certain facts disclosed by investigation conducted by the Antitrust Division. The over-all investigation related to the whole drug and pharmaceutical industry and as a result of this over-all investigation a number of indictments were returned and some cases were instituted under the antitrust laws. Court action has not been taken in the particular situation which I am about to disclose, primarily because the patents which were employed in this situation to effect the restraint were subject to a private suit. It was thought that the antitrust proceedings should not be instituted during the pendency of this private litigation, not because this private litigation would be necessarily controlling in the antitrust question, but because the decision as to whether antitrust proceedings would be necessary could more intelligently be made in the light of the outcome of that litigation involving the validity of the patents. But it is quite appropriate for this committee to have the facts now because of their unusual significance in connection with the proposed legislation considered by the committee.

I doubt if there is any situation which the Department of Justice could present which would bear more directly upon the subject covered

Digitized by Google

by S. 702 than the facts which I am going to disclose this morning. In disclosing these facts I have in mind primarily to enlighten the committee as to the abuses which may be committed in the name of privately subsidized nonprofit research foundations.

Some of the activities and practices which will be described may not be presently in effect and may not be carried on today, but their pertinence to the inquiry of this committee is none the less pointed if some of them may have recently been discontinued.

In the annals of monopoly few trusts are as malignant as those which affect the health of our Nation. Today I am going to present material involving the monopolistic control of one of the most essential products of our modern era—the sunshine vitamin, also known as vitamin D. The effect of this monopolistic control has been magnified by the fact that it is the poorer elements of our community which have the greatest need for this product, since it is a preventative and a cure for certain diseases most commonly found among the lower economic strata of our population. Vitamin D is essential for proper bone growth and development, the prevention and cure of rickets, and the prevention or reduction of tooth decay.

The CHAIRMAN. Let me interrupt just at that point, Mr. Berge. Are we not facing, as our troops advance into Europe and reoccupy the conquered countries that have been undergoing a period of partial starvation, to say the least, a situation in which it is going to be necessary to use a quantity of vitamin D if we would build those people up and prevent them from becoming permanent cripples, and will that not have to be furnished by the United States Government in large part?

Mr. BERGE. I am sure it will have to come from this country.

The CHAIRMAN. And, of course, will be a part of our war effort in getting those countries stabilized so they are not dependent on us for support in the future.

Mr. BERGE. I am sure that the export of this vitamin should be a very cardinal part of our program for rehabilitating Europe when the war is over.

The CHAIRMAN. Doesn't this involve, for instance, a thing called viosterol, with which all of us are somewhat familiar?

Mr. BERGE. Yes; it does; and as my discussion proceeds I am going into those things. Practically every family at some time or other has used viosterol, and as this story progresses I am going to bring out how these abuses directly involved viosterol.

The Wisconsin Alumni Research Foundation acts as a screen behind which a group of monopolistic chemical, pharmaceutical, and food companies control vitamin D. The story of the Wisconsin Alumni Research Foundation is of extreme importance to this committee because it indicates how a quasi-public research organization can be flagrantly misused.

At the outset, I should like to state that the Wisconsin Alumni Research Foundation has no formal connection with the University of Wisconsin, and that the University of Wisconsin has absolutely no control over the policies and practices of the alumni foundation. It should be clearly understood, therefore, that nothing contained in this report reflects in any manner upon the University of Wisconsin.

Digitized by Google

The report of the trustees of the foundation, dated June 22, 1931, defines the objectives and purposes of the foundation as follows:

Indeed, one of the soundest reasons for the development of the foundation as a suitable means of handling the Steenbock process lies in the rigid control through which it is possible to protect the public and prevent unscrupulous commercialism from capitalizing the Steenbock discovery.

The investigation by the Antitrust Division indicates, however, that somewhere along the line these laudable objectives were lost. Instead, a summary of our investigation discloses the following:

(1) The foundation has been the vehicle for creating a domestic monopoly resulting in division of fields, price fixing, control of container size, and limitation of potency of vitamin products. As a result, the public has been charged excessive and arbitrarily high prices. The foundation has been described by a licensee as being "merciless in beating out competition" in the field of vitamins.

(2) The foundation has considered plans to denature and adulterate vitamin D preparations in order to maintain high prices.

(3) The foundation has exhibited a lack of interest in research unless a commercial advantage could be obtained.

(4) The foundation has used threats of patent litigations under patents which it knew were very weak to eliminate competition. Some of these patents upon which the monopolistic scheme rested were, in fact, declared invalid in 1943 by the Circuit Court of Appeals for the Ninth Circuit.

The CHAIRMAN. A question just at that point. Isn't it a fact that in a great number of cases a patent is just really the basis for a lawsuit with which to drive a weak competitor out of the business? I am not speaking of the legal purpose, but of the use purpose as practiced by large groups or organizations.

Mr. BERGE. Patents have certainly been used that way, and I think studies that were made before the T. N. E. C. pretty clearly brought out that a multiplicity of infringement suits by well-established and large, financially well-off concerns have been an instrument of forcing economic monopoly in situations where, perhaps, there was no monopoly and in situations where, if the situation could have been thoroughly aired in court by contestants equally matched, the patents wouldn't have been upheld, but a lot of these infringement suits, of course, never go to court; the threat of the litigation or the institution of it is enough to drive competitors out of the field.

The CHAIRMAN. Pardon the interruption. Just go ahead.

Mr. BERGE (continuing). (5) The foundation has suppressed the use of competing processes.

(6) The foundation has organized international cartels with I. G. Farben, of Germany, and Joseph Nathan & Co., of Great Britain, in order to eliminate world competition by dividing world territory into noncompetitive areas.

(7) The foundation has attempted to suppress the publication of scientific research data which were at variance with its monopoly interest.

(8) The foundation, in order to maintain its price-fixing arrangements, has acted as a police organization for its licensees by setting up a black list of price-cutting distributors.

84949—44—pt. 6——3

Digitized by Google

(9) The foundation's licensing scheme has discouraged research by its licensees.

(10) The foundation has endeavored to suppress or prevent truthful advertising in order to eliminate competition.

(11) The foundation has required its licensees to charge unreasonable prices to the Government. A reasonable profit was deemed insufficient.

(12) The foundation has forced farmers to buy vitamin-enriched animal feeds in a monopoly market.

Since 1925 the production and use of vitamin D has been under the control of the Wisconsin Alumni Research Foundation. The control has been based upon the so-called Steenbock patents, and especially upon patent No. 1,680,818 which the foundation regards as the basic patent on vitamin D.

About 1925 Dr. Steenbock, then a professor at the University of Wisconsin, conducted experiments which eventually resulted in the Steenbock patents. Recognizing the commercial possibilities of his developments, Steenbock offered his patents to the university, but the regents of the University did not feel themselves in a position to commercialize them.

The president of the Wisconsin Alumni Association at that time was George I. Haight, a very able patent lawyer of Chicago, who immediately recognized the commercial possibilities of the Steenbock development. Mr. Haight, together with some of the other leading alumni of the university, founded the Wisconsin Alumni Research Foundation to undertake the exploitation of the Steenbock patents and such other patents as the foundation might from time to time acquire.

The CHAIRMAN. At that point, in connection with the research, not the exploitation, but the research leading to the discoveries that were patented, do you have any information as to how this research was financed? Was it financed wholly or in part from public or Federal funds, or did the foundation have any financial part in the conducting of the research work on which the patents were based?

Mr. BERGE. I understand that Steenbock's salary at the time he did this research was from the Wisconsin Agricultural Experiment Station, and partly also from Federal funds, so I think it is fair to say that the money on which the work was done leading to the development of this process was furnished jointly by State and Federal funds.

The CHAIRMAN. In other words, the foundation which now controls, handles and monopolizes the patents had nothing to do with the development of the invention or the formula from which the product comes, but are merely reaping a harvest from an investment of State and Federal funds by a public employee?

Mr. BERGE. That's true. The foundation was formed subsequent to the development of the process, after the work had been done, I guess after the patents had been obtained. In any event, whether the patent was obtained immediately after or just before, the foundation was formed to develop and exploit the process which Dr. Steenbock had developed as a research worker on State and Federal funds.

The CHAIRMAN. That is particularly interesting because that is in

Digitized by Google

line directly with the purpose of this bill that we have under consideration——

Mr. BERGE. That is what I thought.

The CHAIRMAN. Go right ahead, Mr. Berge.

Mr. BERGE. The Wisconsin Alumni Research Foundation was chartered on November 14, 1925, as a nonprofit corporation, and its purposes were stated in the charter to be:

> To promote, encourage, and aid scientific investigation and research at the University of Wisconsin by the faculty, staff, alumni, and students thereof, and those associated therewith, and to provide or assist in providing the means and machinery by which their scientific discoveries, invention, and processes may be developed, applied, and patented, and the public and commercial uses thereof determined, and by which such utilization or disposition may be made of such discoveries, inventions, and processes, and patent rights or interests therein, as may tend to stimulate and promote and provide funds for further scientific investigation and research within said university or colleges or departments thereof; * * *.

The foundation is managed by a board of trustees. Originally these trustees personally handled the work of the foundation, but in 1930 they secured the services of Henry L. Russell, former dean of the University of Wisconsin College of Agriculture. Russell was made director and executive head of the foundation. Later, as business increased, L. D. Barney was employed as business manager, and Ward Ross, an associate of Haight, was retained as general counsel. Steenbock himself appears to have handled most of the technical matters of the foundation insofar as they relate to vitamin D.

The royalties received by the foundation are invested, and the resulting income is utilized for research.

The foundation has controlled vitamin D by reason of its ownership of the Steenbock Patents Nos. 1,680,818, 1,871,135, 1,871,136, and 2,057,399. The underlying concept of all of these patents is that certain substances called provitamins may be activated so as to result in a product having a high vitamin D potency. This activation is accomplished by exposing the provitamin to ultraviolet light, and the basic patent is limited to activation by ultraviolet light produced by an artificial source such as a quartz mercury vapor lamp.

The commercialization of the Steenbock patents was phenomenally successful almost from the very outset. The report of the trustees of the foundation, dated June 22, 1931, states on page 2:

> The accumulation from royalties so far have been almost wholly from the ultraviolet patents. During the calendar year 1930, the gross income was $354,590, or very nearly $1,000 a day throughout the year. This income has been developed within less than 3 years.

The foundation's annual royalties showed a steady increase until 1936, when they amounted to nearly $1,100,000. After 1935, the annual royalties decreased slightly, and in 1939 they amounted to $936,610.70, or over $2,500 per day. Up to 1940, the foundation had received more than $8,500,000 in royalties.

The royalty rates charged by the foundation vary from 10 percent to 3 percent, and less, with the higher royalties applying to only a few products. The enormous size of the market is indicated by the munificent revenues yielded by royalties at these rates.

LICENSING PROGRAM

The first requirement for the success of the foundation's licensing program was the elimination of competition from nonlicensees. The foundation's practices in this respect are described in a memorandum dated February 20, 1935, from Connolly, a du Pont patent attorney, to Kupperian of du Pont. The memorandum states:

> The foundation has been merciless in beating out competition throughout the United States wherever such competition threatened to encroach upon the synthetic vitamin D field.

Some of the leading manufacturers in the country are licensees of the foundation. Many of these manufacturers have been licensees for years, while in some cases licenses were obtained by the acquisition of companies holding licenses. Both du Pont and Standard Brands obtained their licenses by the latter method.

Acetol Products, Inc., had a license from the foundation dated November 15, 1929. Du Pont acquired the assets of Acetol and on April 30, 1935, Acetol assigned its license to du Pont. On November 15, 1935, a new agreement was executed between the foundation and du Pont which superseded the Acetol agreement of November 15, 1929.

Standard Brands succeeded to the rights of the Fleischmann Co. under an agreement dated August 8, 1928.

The question naturally arises why these powerful manufacturers would pay the foundation such large royalties on the basis of the weak and limited Steenbock patents. The correspondence indicates that the licensees were not only willing but anxious to pay the royalties in return for the profit opportunities offered under the foundation's schemes

The desire of the licensees to cooperate in the foundation's promotional schemes is well expressed in a latter dated July 8, 1935, from Atkins of du Pont to Barney of the foundation. This letter states:

> The writer feels certain that you understand our desire and willingness to be considered as a part of the foundation. You know our desire to prevent the vitamin D field from falling into disrepute because of too many producers of various types of so-called vitamin D. We would much prefer centralized control in the hands of the foundation and you may count on us to support you even though, at times, we may have differences of opinion.

A memorandum dated January 25, 1937, from H. W. Elley, associate chemical director of du Pont, to a number of the executives of du Pont, explains the reason for centralizing control in the hands of the foundation. This memorandum states:

> He (Mr. Protto, assistant general manager of du Pont) felt that it would be preferable to deal with the Wisconsin Alumni Foundation since they could be of considerable value to the industry in policing and regulating matters. If for any reason such arrangements became unsatisfactory, it would then be possible to consider alternative procedures not involving the use of the foundation patents, that is, we might commercialize the Milas process.

The CHAIRMAN. This memorandum would seem to indicate that some business concerns are willing to go to great lengths to eliminate competition and to create and maintain monopolies.

Digitized by Google

Mr. BERGE. That is right. I think it is interesting also in regard to this extract I just read, that it is quite obvious from it that du Pont was merely thinking of the foundation in terms of its use to the industry in policing and regulating matters, and they indicate in here that if it should later become unnecessary to use the foundation for that purpose, that then they would be willing to disregard the Steenbock patents.

The CHAIRMAN. Go into the competitive field themselves.

Mr. BERGE. Yes. Then they would work under this other process, which is a rival process. I am also reminded that du Pont owned the Milas process, so they indicate their preference for using the Steenbock process with this commercial protection which they think they could get from the foundation and pay the foundation the royalties in preference to development of the use of a process which they owned.

The CHAIRMAN. And which may have been as good.

Mr. BERGE. Yes. The Wisconsin Alumni Research Foundation's licensing program is organized along the lines of an international cartel. The foundation is party to an agreement with the omnipresent I. G. Farbenindustrie of Germany and to another agreement with Joseph Nathan & Co. of Great Britain.

The CHAIRMAN. I. G. Farben—that name comes in every place, apparently. As you said, it's omnipresent. Can you tell me how many patent arrangements or agreements I. G. Farben is mixed up in according to your studies?

Mr. BERGE. We know of at least 162 agreements between Farben and other companies affecting American industry. I wouldn't be sure that those agreements are all with American companies, but they are either with American companies or with companies of other countries, affecting and containing provisions that affect business in this country.

The CHAIRMAN. I. G. Farben is a Government-controlled monopoly of Germany—is that not right?—and has become such under Hitler particularly?

Mr. BERGE. Certainly.

The CHAIRMAN. In other words, it is not a free industry of Germany, but a Government-controlled monopoly in Germany.

Mr. BERGE. That is right. The agreements, following the standard cartel pattern, create exclusive noncompetitive territories. Nathan and I. G. are prohibited from exporting to the United States, and the domestic licensees of the foundation are prohibited from exporting to Germany or Great Britain.

The CHAIRMAN. Are these agreements with Farben and Nathan still in effect?

Mr. BERGE. So far as we know, they are.

The CHAIRMAN. There has been no revocation of those agreements?

Mr. BERGE. Not that we know of.

The CHAIRMAN. In fact, we find a similar situation there that we find in Standard of Jersey, in which there is a cartel agreement, which, while not openly, in the courts, operative, is still held in abeyance and carried out as far as the conditions of war will permit without prosecution.

Digitized by Google

Mr. BERGE. I certainly think that is a fair statement of the factual situation as we understand it.

The domestic licensing policy of the foundation is characterized by a most complex and minute division of fields into noncompetitive areas. Generally speaking, these fields of activity are made exclusive so that all competition between the different licensees or groups of licensees is eliminated. Provisions of the various agreements, which will be later described, prevent any substantial overlapping of these fields. Often the provisions merely prohibit the licensee from accurately describing his product, but the essential object, elimination of competition, is attained.

The CHAIRMAN. Can you specify in more detail just how restrictions on accurate descriptions of products help to eliminate competition?

Mr. BERGE. I am going to specify that a little later on in my statement, Senator. I could go into it now.

The CHAIRMAN. Let's wait until you get down to it in your orderly way.

Mr. BERGE. Thank you.

Fields are divided along three distinct lines: (*a*) The product to be activated, (*b*) the method of activation, and (*c*) the use of the activated product. In the first category there are 13 principal divisions: (1) The pharmaceutical licensees are permitted to activate ergosterol, (2) Standard Brands is licensed to activate yeast and yeast products, (3) du Pont is allowed to activate ergosterol, cholesterol, and other sterols except yeast and yeast products, (4) S. S. Kovaks is allowed to activate sterols derived from yeasts but not yeast, (5) a group of licensees are permitted to activate evaporated milk, (6) a number of licensees are permitted to activate fluid milk, (7) Quaker Oats is allowed to activate cereals, (8) Borden is allowed to activate a milk product known as Dryco, (9) The Wander Co. is allowed to activate Ovaltine, (10) the Commander Larrabee Co. is allowed to activate flour.

The CHAIRMAN. Let me interrupt there with a question. Does this mean that the Quaker Oats Co., Commander Larrabee, and others are given exclusive rights in a particular limited field, and in that field only, so there can be no competition, and they cannot go out of that particular field?

Mr. BERGE. That is what it means.

The CHAIRMAN. In other words, you don't get the right to use the patent under this. You get to use the patent to do a certain minute process in what you are making, and that only, and you can't use research to go beyond that and possibly help out in something else.

Mr. BERGE. That's right; and if you did, you would be violating your license.

The CHAIRMAN. All right.

Mr. BERGE. (11) R. B. Davis & Co. is allowed to activate Cocomalt, (12) Loose-Wiles Biscuit Co. is allowed to activate crackers, and (13) Ayerst, McKenna & Harrison are allowed to activate a food product known as Glucose–D.

The extent to which the division of fields is carried is exemplified in an agreement dated June 27, 1939, between the foundation and the Loose-Wiles Biscuit Co. This agreement authorizes Loose-Wiles to activate graham crackers and wafers slightly sweetened, such as Eng-

Digitized by Google

lish style arrowroot wafers, but does not permit the activation of cakes and cookies.

The CHAIRMAN. Then consumers are forced to buy, say, cereals from Quaker Oats or flour from Commander Larrabee or crackers from Loose-Wiles, if they want a vitamin D enriched food, and that gives an unfair advantage and also enables the price-control scheme to work. In your opinion, does this arrangement substantially limit the output or distribution of vitamin D to the public? In other words, is it a limiting factor?

Mr. BERGE. It certainly must have that effect, Senator Kilgore, because the generally recognized beneficial properties of vitamin D are such that if the licenses weren't restricted in that manner, presumably every manufacturer who manufactures a product in the field would no doubt use the vitamin and no doubt for competitive reasons The free competitive operation in crackers, for example, would mean that if Loose-Wiles can activate crackers with vitamin D, competing crackers for advertising reasons, if for no other, would want to be free to do it and would do it, but the effect of the restricted licensing on crackers, say, would be to hold it down.

The CHAIRMAN. And would pay a royalty for doing it if they could get a chance?

Mr. BERGE. Oh, yes; certainly. In fact, the extent to which the division of fields is carried is exemplified by this agreement between Loose-Wiles and the foundation.

Mr. SCHIMMEL. Mr. Berge, do you know whether it is beneficial to activate these biscuits with vitamin D? It seems to me one or two alternatives exist. If it is beneficial then all crackers should be permitted to be activated; and if it isn't, vitamin D is being used as an advertising stunt.

Mr. BERGE. Yes. I should qualify my answer to the previous question that I am no authority on what products it is beneficial in and when it is not beneficial to activate with vitamin D. My answers to the last questions were based on the assumption that it is beneficial to activate crackers with vitamin D. If it is not beneficial, then the exclusive advertising privilege should not be given to one company, and if it is beneficial I should say they should all have the right to do it.

The CHAIRMAN. Especially when this is a publicly developed patent.

Mr. BERGE. Yes. We will see, as we go along, some products cannot be successfully activated and efforts to do it from a scientific standpoint have failed, yet nevertheless they have endeavored to continue doing it in order to have the royalties that come from an exclusive licensing arrangement to a single company to activate a single product. I suppose, again, if there were free competition in the field it would be impossible for one company to fraudulently represent that its use of the vitamin in its product improved the product, because others would come along and demonstrate the fallacy of it.

According to the method of activation, fields are divided into direct irradiation and activation by the introduction of an irradiated substance. Some few licensees are permitted to use either method of activation, but most are restricted to a single method. One of the most curious licenses issued by the foundation permits the activation of milk by feeding cows irradiated material.

Digitized by Google

The CHAIRMAN. Can you elaborate further on this license for feeding cows irradiated material?

Mr. BERGE. Yes, I can; but later I am going to discuss the milk licenses. We have licenses for evaporated milk, licenses for fluid milk which are confined to the feeding of irradiated material, and others which permit direct irradiation of the milk, and others which permit the introduction of irradiated substances in the milk, but I have a subject on milk and I believe I will defer that until we get to it.

The next method which we will discuss is the division of fields according to use, and this is most detailed but it can be broken up into several general classes. Licenses are issued for the human medicine field, for the human food field, for the fluid milk field, for the evaporated milk field, for the animal feed field, and for a field in which the product is not intended for internal use.

At the outset, it was pointed out that the stated objectives of the foundation are "to protect the public" and "to prevent unscrupulous commercialization." Over the years the foundation's devotion to these objectives appears to have wavered. The foundation appears to be primarily interested in royalties, with little or no regard for the public interest. Article VII of the agreement of November 1, 1938, with the milk companies states that if—

it should be found that the activation of unsweetened evaporated milk by ultraviolet rays under this license is substantially harmful to the user of such milk, or to the milk itself, the licensee shall have the right to cancel this license.

Dr. Russell, in a memorandum dated February 8, 1939, describes a similar position of the foundation in regard to high dosages of vitamin D. This memorandum states:

Steenbock is of the opinion that in view of the fact that vitamin D is no longer a distinctive Steenbock product but can be secured from a variety of sources that the foundation might as well favor the commercialization of high dosages unless there is *very* serious objection on the part of A. M. A. officials toward a move of this sort.

It is to be noted that in neither of these cases is the foundation concerned with public benefit or medical approval, but only with substantial harm and a very serious medical objection.

Another instance of the foundation's regard for the public interest was the Snider Packing Co. matter. In 1931 the Snider Packing Co. obtained irradiated yeast from Fleischman to add to Snider's tomato juice. The results were aparently not too satisfactory.

After this 1931 failure, Snider was persuaded to continue the license and the foundation undertook to supervise the activation of the tomato juice. Steenbock and Scott recommended Acetol irradiated ergosterol and this recommendation was followed.

Despite the recommendations and supervision and guarantees of the foundation, the vitamin D content of the Snider tomato juice did not come up to expectations. This inadequacy was known to Snider, Acetol, and the foundation, and on February 27, 1933, Russell wrote to Acetol stating:

It would be most unfortunate if any publicity was to occur as a result of the reduced potency of the Snider product for it would not only ruin the Snider business in this product, but would reflect most disastrously upon you as well as ourselves. If the Government were to discover this situation and publish the result, it would do irreparable injury to the whole vitamin D situation in foods.

Digitized by Google

The correspondence does not show whether any of the Snider products reached the market under false labels, but the foundation's concern in the matter is clear. The foundation feared only publicity or discovery by the Government.

The CHAIRMAN. At that point I want to ask this. From your study of all those agreements and those limitations placed in the agreements, isn't it rather apparent that the agreements limited research and activity by the licensees? They did not encourage better use by the licensees and a furthering of their activities in different fields, the limitation being for the purpose of controlling the market and the limitation removed would possibly have worked beneficially to the companies that were licensees in producing a better product that was not to be contemplated in the license, had they been able to go ahead with the proper research?

Mr. BERGE. I think the agreements are shot through with limitations of that kind. I think we will see it in this story.

The CHAIRMAN. I am going to ask Senator Holman to take charge for a few minutes.

(Senator Holman took the chair.)

Mr. BERGE. In 1934 and 1935 some research workers, and especially Dr. Reed, of the University of Illinois, found that large doses of vitamin D were highly beneficial in severe cases of asthma, hayfever, and arthritis. These large doses required a highly concentrated product which was most easily used in the form of gelatin capsules. The foundation and its licensees were greatly interested in this project, but feared the effect this concentrate might have on the pricing structure of viosterol. These fears and a suggested solution are referred to in a report of a conference between Russell and Ross, of the foundation, and Nielsen, of Abbott, held early in February 1935. This report, signed by Nielsen, states:

> Mr. Nielsen stated that if the capsules were priced considerably lower than the commercial product unit for unit, nothing would prevent the hospitals from opening the capsules and diluting the content with vegetable oil to obtain a "250D" solution far below the regular cost.
>
> Dean Russell asked for suggestions to prevent this. Mr. Nielsen stated that Abbott Laboratories would give further thought to this problem. Tentatively he suggested that the concentrate might be denatured by the addition of a drug also indicated in these cases—ephedrine, for example—that the product be considered as a drug, not a vitamin, and that it be distributed for clinical trial under a special name—all provided that the licensees agree. *Any untoward effects from it thus would not reflect on the viosterol products on the market.* [Italics supplied.]

I think it is clear what they were driving at, that the fear was that this high potency vitamin D if put out at a price within the reach of the limited market which would desire it; that is, the market for asthma, hayfever, and arthritis cases, might be taken and diluted and used in the other pharmaceutical channels where such potency was not required, and it would thus be possible to take the high potency vitamin and water it down, as it were, and thereby obtain viosterol for ordinary pharmaceutical uses at prices much lower than the prices that were being commercially maintained by the foundation on regular viosterol products.

Mr. SCHIMMEL. Can you explain, Mr. Berge, how they propose to prevent that?

Digitized by Google

Mr. BERGE. All we have is the suggestion here that it might be done by introducing into the high potency capsules another drug which they thought was consistent, at least they were willing to experiment and see whether it was consistent, with its use for asthma, hayfever, arthritis, which would disqualify it for general use. They discussed ephedrine, the idea being that by introducing this into the capsule, though it is quite unnecessary to have it there for the asthma, hayfever, and arthritis cases, it would create a situation whereby it couldn't be used for anything else and whereby the hospitals couldn't extract the oil or the substance.

Mr. SCHIMMEL. Why couldn't it be used for anything else? Would the ephedrine be harmful?

Mr. BERGE. I suppose it might. Ephedrine is a drug that certainly has its place in many types of ailments, particularly connected with the respiratory system, but also I believe is deleterious in other cases. I think there are some patients advised against the use of ephedrine. Certainly the average person taking viosterol for vitamin D doesn't want ephedrine, and I suppose you wouldn't want to give ephedrine to babies, except in special cases where it is called for.

Despite its lofty objectives, the licensing program of the Wisconsin foundation appears to have resulted actually in a substantial reduction of research and development. The foundation's own attitude toward research is indicated in a letter from Russell to the licensees dated August 24, 1936, which states:

> * * * We are hardly interested in the prosecution of problems of a purely scientific character that come to us from outside institutions. Nevertheless, if this is a problem that has definite commercial possibilities, we should not make a hasty adverse decision.

In a letter dated January 6, 1937, addressed to Elley, of du Pont, Waddell, of du Pont, refers to a meeting in Madison with members of the foundation and states:

> * * * He (Steenbock) mentioned that most of the pharmaceutical licensees had not been interested in obtaining rights to the manufacture of crystallin vitamin D (from ergosterol) and that the present situation might find them with the same attitude. He admitted, however, that if the patent situation and licensing arrangements worked out so that the five pharmaceutical companies were again in a position of having an exclusive hold of the synthetic vitamin D field that undoubtedly they would be very much interested.

Thus, in spite of the acknowledged physiological superiority of vitamin D_3, the foundation was reluctant to do any research whatever unless the willingness and cooperation of the licensees showed a definite promise of substantial profits.

The effect of the licensing policy on the research activities of licensees is explained in a letter from Killheffer of Acetol to Waddell, research director of Acetol. This letter states:

> According to my reading of the contract with Wisconsin Alumni Foundation, we are not at liberty to use yeast in connection with irradiated ergosterol, this field being reserved exclusively to Fleischmann. In view of this fact, I do not think we ought to waste time or money on experiments in connection with yeast.

In at least one case where the foundation sponsored and financed research, the publication of the results of the research was suppressed by the foundation because they were at variance with the foundation's commercial interests. In an attempt to eliminate the noninfringing product of General Mills from competition with the viosterol of the

Digitized by Google

pharmaceutical licensees, the foundation attempted to prove that viosterol was clinically superior to the General Mills product. To accomplish this, the foundation made a grant to Drs. Smith and Owens, of Freedman's Hospital, in Washington, D. C., to run certain tests comparing the effectiveness of the General Mills product and viosterol, and to prepare an article for the medical journals on the results. On June 17, 1936, Drs. Smith and Owens submitted to the foundation their article, which contains the following conclusion:

A comparative study of nine cases of varying degrees of rickets receiving 800 U. S. P. units of Squibb's Viosterol daily with eleven comparable cases receiving 800 U. S. P. units of American Pharmaceutical Co. Viosterol (General Mills product) shows no significant difference in rate or degree of healing as determined (1) by X-ray of the wrists and
(3) Ca and P determinations on the blood.

The attitude of the foundation and its licensees to this article is described in a letter from Lescohier of Parke, Davis to Anderson of Squibb, dated July 6, 1936. Dr. Lescohier states:

If this article is published the Steenbock group are certainly in the position of being hung with their own rope. I should like to see the publication suppressed but am pretty certain that Mead Johnson will see that it is published, since they are no longer vitally interested in viosterol. Certainly anything that can be done to delay publication would be advisable.

In a letter dated August 17, 1936, Scott, of the foundation, expressed the foundation's attitude on this article as follows:

* * * From the outset, of course, we have been opposed to publication of this paper in any form. We have advised Dr. Smith that it was necessary to get the opinions of the pharmaceutical committee, and we intend to confer with them in the near future, advising them that publication of the work is not desirable.

Mr. SCHIMMEL. Did this article ever appear, or did the foundation succeed in suppressing it?

Mr. BERGE. I think it did not appear. We have checked on that. I have a note here on it, which is the result of the check that was made last evening or this morning, and I will read it:

Drs. Smith and Owens received $3,000 from the foundation to carry on research in the comparative value of two kinds of viosterol in the treatment of rickets, but they neglected to stipulate in their agreement that the findings would be published regardless of the outcome. When the results showed that the rival viosterol was as effective as the foundation's product the foundation refused to permit publication. There has been no publication of the results of the comparative tests of the two kinds of viosterol. Some of the material from the study which did not bear on the comparison between the foundation's product and the other product was published in January 1940 in the Journal of Pediatrics. The foundation, therefore, was successful in preventing publication in a medical journal of the results of the study.

The only publication was of other matter collaterally obtained in the investigation, but the comparison of the two products was never published.

Mr. SCHIMMEL. Mr. Berge, did those five manufacturers represent any sizable proportion of the business?

Mr. BERGE. Certainly not in numbers of companies. We know of 190 pharmaceutical manufacturers. Now, some of those may be pretty small, but this would be a very small percentage of the total number.

Mr. SCHIMMEL. They limited the use of manufacture of vitamin D by pharmaceutical houses to 5 out of approximately 200 drug manufacturers?

Digitized by Google

Mr. BERGE. Of course, I said a moment ago many of these 190 may be small companies, and one can speculate that this is one of the reasons they are small, because they don't get in on the important licenses like this.

The foundation has also suppressed the use of competing patents. Article II of the supplemental agreements of June 3, 1937, between the foundation and Mead, Johnson, Squibb, Parke-Davis, and Abbott provides for the licensing of additional pharmaceutical manufacturers who had been using Sperti patent No. 1,676,579 on the irradiation of pharmaceutical products. This section provides:

> It is understood and agreed that such additional licensees shall be prohibited, by appropriate restrictions in any license agreements that may be entered into between the licensor and such additional licensees, from employing the process described and claimed in United States letters patent No. 1,676,579 to George Sperti and from advertising the use of said process in connection with products sold under said license agreements. * * *

Thus the results of the foundation's licensing program have been to stifle its own research activities and the research activities of its licensees, to prevent the publication of information which might jeopardize the foundation's financial interests, and to suppress competing patents. Certainly these are peculiar results of a program instituted "to protect the public" and "to prevent unscrupulous commercialism."

PHARMACEUTICAL LICENSES

One of the most important fields in the foundation's scheme of exploitation is the pharmaceutical field. All vitamin D products used in the treatment or prevention of human ills are embraced within the pharmaceutical field, and restrictions in this field thus have a direct and immediate effect on the health and well-being of the general public. Also, at the time the foundation embarked on its licensing program, the pharmaceutical field probably was one of the most promising, both from a publicity and a profit standpoint.

In or about March 1929 the foundation made agreements with five licensees, all manufacturers of pharmaceuticals: Mead, Johnson & Co., Winthrop Chemical Co., Abbott Laboratories, Parke-Davis & Co., and E. R. Squibb & Sons. These agreements have been amended several times by letter agreements and supplemental agreements. Two letters, dated March 20 and April 27, 1939, offer the licensees certain royalty reductions, and it is assumed that these reductions were accepted. These letters do not, however, make any substantial changes in the restrictive provisions of the agreement.

PRICE FIXING

This combination in restraint of trade between the foundation and its licensees is expressed in various ways throughout the pharmaceutical licenses. For example, article XII of the agreement of March 21, 1929, fixed minimum prices for the sale of irradiated pharmaceutical products. This article contains the following language:

> Such prices so established shall remain in effect indefinitely but may be changed by the licensor not less than ninety (90) days after consultation with all the licensees of this group.

Article XIII of the agreement of March 21, 1939, states that the potencies of the pharmaceutical products shall remain fixed "until

Digitized by Google

and unless changed by the mutual understanding of a majority of the licensees of this group." Article XVII prevents the assignment of the licenses "without the written consent of the licensor, the patentee, and the licensees under similar licenses." Each of the agreements with Abbott, Mead Johnson, Squibb, and Parke, Davis, executed June 3, 1937, also contain long recitals regarding the provisions to be introduced into a new contract with Winthrop Chemical Co., Inc.

Price stabilization was one of the main considerations offered by the foundation to its licensees in exchange for the royalties. It might almost be said that this price stabilization was the bait which made the licensing scheme of the foundation so attractive to the various manufacturers. Clough, of Abbott, wrote to R. Russell, of the foundation, on April 21, 1936, and referred to the importance of price-fixing activities of the foundation in this language:

It was argued by your trustees that under our arrangement with the foundation, we were given certain benefits of price stabilization which was well worth the additional 5 percent.

Mr. SCHIMMEL. How were these prices fixed, Mr. Berge?

Mr. BERGE. The licensees themselves fixed the prices and the foundation acted as the arbiter. The licensees agreed upon the prices and those became the foundation prices.

Mr. SCHIMMEL. So would it be correct for me to draw the conclusion that the so-called public foundation was a front behind which price-fixing monopolistic practices were being practiced?

Mr. BERGE. I think that is the logical conclusion; yes. Any anti-trust lawyer would advise his client that you can't fix prices by agreement. I don't think it was any more legal done this way, but at least it had the halo that goes with a foundation. The foundation accepted the prices that they agreed upon as the prices that would be enforced through the licensing agreements.

That price-fixing was one of the most important points in the pharmaceutical licensing plan and is described in a memorandum of a conference between Anderson and Lewis, of Squibb, and Ross and Barney, of the foundation, on February 3, 1939. The memorandum states:

We outlined the high potency D situation both with respect to Merrell and Winthrop. Their reaction was first that Squibb would have no objection to Merrell's continuing to sell its concentrated viosterol if we could line up Merrell on its regular viosterol from the standpoint of container size and price. We indicated that this latter could be accomplished.

Further, the papers indicate that this price fixing was carried over into the field of resale prices. This is brought out in a letter from R. D. Keim, of Squibb, to Dean Russell, of the foundation, dated July 23, 1934, in which Mr. Keim states:

We gave this matter our very serious consideration and wrote to all of the licensees, under date of July 19, 1934, as per copy enclosed and we firmly believe that our suggested full retail prices per package to the consumer and minimum retail prices per package to the consumer for viosterol in oil and cod liver oil with viosterol are more in line with present market trends and the present economic market conditions than those proposed by Parke Davis & Co.

We are desirious of acting in harmony with all the other licensees of the Wisconsin Alumni Research Foundation in regard to the stabilization of the market for viosterol in oil and cod liver oil with viosterol. However, we firmly believe that it is necessary to establish a schedule of minimum retail prices to the consumer such as we have suggested in order to bring about such stabilization.

Prices were not only fixed; they were fixed arbitrarily at levels which can only be regarded as extortionate in view of the economic status

Digitized by Google

Mr. BERGE. Of course, I said a moment ago many of these 190 may be small companies, and one can speculate that this is one of the reasons they are small, because they don't get in on the important licenses like this.

The foundation has also suppressed the use of competing patents. Article II of the supplemental agreements of June 3, 1937, between the foundation and Mead, Johnson, Squibb, Parke-Davis, and Abbott provides for the licensing of additional pharmaceutical manufacturers who had been using Sperti patent No. 1,676,579 on the irradiation of pharmaceutical products. This section provides:

> It is understood and agreed that such additional licensees shall be prohibited, by appropriate restrictions in any license agreements that may be entered into between the licensor and such additional licensees, from employing the process described and claimed in United States letters patent No. 1,676,579 to George Sperti and from advertising the use of said process in connection with products sold under said license agreements. * * *

Thus the results of the foundation's licensing program have been to stifle its own research activities and the research activities of its licensees, to prevent the publication of information which might jeopardize the foundation's financial interests, and to suppress competing patents. Certainly these are peculiar results of a program instituted "to protect the public" and "to prevent unscrupulous commercialism."

PHARMACEUTICAL LICENSES

One of the most important fields in the foundation's scheme of exploitation is the pharmaceutical field. All vitamin D products used in the treatment or prevention of human ills are embraced within the pharmaceutical field, and restrictions in this field thus have a direct and immediate effect on the health and well-being of the general public. Also, at the time the foundation embarked on its licensing program, the pharmaceutical field probably was one of the most promising, both from a publicity and a profit standpoint.

In or about March 1929 the foundation made agreements with five licensees, all manufacturers of pharmaceuticals: Mead, Johnson & Co., Winthrop Chemical Co., Abbott Laboratories, Parke-Davis & Co., and E. R. Squibb & Sons. These agreements have been amended several times by letter agreements and supplemental agreements. Two letters, dated March 20 and April 27, 1939, offer the licensees certain royalty reductions, and it is assumed that these reductions were accepted. These letters do not, however, make any substantial changes in the restrictive provisions of the agreement.

PRICE FIXING

This combination in restraint of trade between the foundation and its licensees is expressed in various ways throughout the pharmaceutical licenses. For example, article XII of the agreement of March 21, 1929, fixed minimum prices for the sale of irradiated pharmaceutical products. This article contains the following language:

> Such prices so established shall remain in effect indefinitely but may be changed by the licensor not less than ninety (90) days after consultation with all the licensees of this group.

Article XIII of the agreement of March 21, 1939, states that the potencies of the pharmaceutical products shall remain fixed "until

Digitized by Google

and unless changed by the mutual understanding of a majority of the licensees of this group." Article XVII prevents the assignment of the licenses "without the written consent of the licensor, the patentee, and the licensees under similar licenses." Each of the agreements with Abbott, Mead Johnson, Squibb, and Parke, Davis, executed June 3, 1937, also contain long recitals regarding the provisions to be introduced into a new contract with Winthrop Chemical Co., Inc.

Price stabilization was one of the main considerations offered by the foundation to its licensees in exchange for the royalties. It might almost be said that this price stabilization was the bait which made the licensing scheme of the foundation so attractive to the various manufacturers. Clough, of Abbott, wrote to R. Russell, of the foundation, on April 21, 1936, and referred to the importance of price-fixing activities of the foundation in this language:

It was argued by your trustees that under our arrangement with the foundation, we were given certain benefits of price stabilization which was well worth the additional 5 percent.

Mr. SCHIMMEL. How were these prices fixed, Mr. Berge?

Mr. BERGE. The licensees themselves fixed the prices and the foundation acted as the arbiter. The licensees agreed upon the prices and those became the foundation prices.

Mr. SCHIMMEL. So would it be correct for me to draw the conclusion that the so-called public foundation was a front behind which price-fixing monopolistic practices were being practiced?

Mr. BERGE. I think that is the logical conclusion; yes. Any anti-trust lawyer would advise his client that you can't fix prices by agreement. I don't think it was any more legal done this way, but at least it had the halo that goes with a foundation. The foundation accepted the prices that they agreed upon as the prices that would be enforced through the licensing agreements.

That price-fixing was one of the most important points in the pharmaceutical licensing plan and is described in a memorandum of a conference between Anderson and Lewis, of Squibb, and Ross and Barney, of the foundation, on February 3, 1939. The memorandum states:

We outlined the high potency D situation both with respect to Merrell and Winthrop. Their reaction was first that Squibb would have no objection to Merrell's continuing to sell its concentrated viosterol if we could line up Merrell on its regular viosterol from the standpoint of container size and price. We indicated that this latter could be accomplished.

Further, the papers indicate that this price fixing was carried over into the field of resale prices. This is brought out in a letter from R. D. Keim, of Squibb, to Dean Russell, of the foundation, dated July 23, 1934, in which Mr. Keim states:

We gave this matter our very serious consideration and wrote to all of the licensees, under date of July 19, 1934, as per copy enclosed and we firmly believe that our suggested full retail prices per package to the consumer and minimum retail prices per package to the consumer for viosterol in oil and cod liver oil with viosterol are more in line with present market trends and the present economic market conditions than those proposed by Parke Davis & Co.

We are desirious of acting in harmony with all the other licensees of the Wisconsin Alumni Research Foundation in regard to the stabilization of the market for viosterol in oil and cod liver oil with viosterol. However, we firmly believe that it is necessary to establish a schedule of minimum retail prices to the consumer such as we have suggested in order to bring about such stabilization.

Prices were not only fixed; they were fixed arbitrarily at levels which can only be regarded as extortionate in view of the economic status

Digitized by Google

of the people whose need for vitamin D was the greatest. Barney, the business manager of the foundation, stated on examination in a lawsuit:

It is my understanding that rickets is found to a great extent in the so-called poorer class of people.

Despite this full awareness of the incidence of their high-price policy, the foundation and its licensees remorselessly maintained prices on the viosterol products so high that their use was practically restricted to those who had least need for them. This is recognized in a letter dated March 30, 1934, from Russell to the pharmaceutical licensees, which states:

3. Very severe criticism from certain prominent pediatricians has been lodged against the foundation on account of the alleged high retail prices of certain vitamin D preparations.

The ACTING CHAIRMAN. May I interpose a question here? Presumably the consumption of these food and drug items containing vitamin D must be enormous to produce the revenue that has been indicated previously in your statement.

Mr. BERGE. It is.

The ACTING CHAIRMAN. But the consumption, you believe, is, even so, among the well-to-do.

Mr. BERGE. Well, you see, Senator, that total revenue from royalties that I mentioned earlier is the over-all royalty figure which comes from the use in foods. I think before you came in I went over a long list of the type of licenses which they grant.

The ACTING CHAIRMAN. You needn't repeat it. I'll get it from the record.

Mr. BERGE. Now, viosterol is one of the more expensive unit products; that is, it is very highly concentrated, and the use of vitamin D in bread, milk, crackers, and for animal feeds would no doubt be less per unit than in this concentrated form, but I am speaking here, of course, about the product that is used particularly in the additional nourishment needed for small children, and we have here this evidence. I merely cited one extract, but there are complaints by pediatricians that the cost of it inhibited its use by those that most needed it.

The price-fixing activities of the foundation also extend to sales to Federal, State, and local governments and Government agencies.

On May 10, 1940, W. S. Merrell Co. wrote to the foundation:

We have an inquiry from the Government for a substantial quantity of irradiated ergosterol and are wondering if we shall have to abide by the price schedule in our license agreement in quoting. In other words, would our quotation have to be the same as our minimum price to wholesalers, or could we figure on a reasonable profit basis, taking our cost on such a large quantity for one shipment into consideration?

The letter also contains a postscript:

We know that the price would have to be much lower than our price to wholesalers to secure the order.

In spite of the fact that Merrell was merely asking to quote on a "reasonable profit basis," and assured the foundation that the price would have to be "much lower * * * to secure the order," Barney, of the foundation, replied on May 13, 1940, stating:

Under the present license agreement with your company and the other pharmaceutical licenses of the foundation under the Steenbock patents, the minimum

Digitized by Google

price to be quoted to Government institutions is the minimum wholesale price as outlined in your contract, less 2-percent discount for cash if paid by the 10th of the following month.

All of the other pharmaceutical licenses of the foundation have operated under this arrangement for some time. We note, however, your postscript which indicates that the quotation to the Government will have to be lower than the price to wholesalers in order to secure the order. We dislike to see your company or any of our other licensees lose business.

In other words, they were sorry about it, but the same price to wholesalers would have to be maintained on Government orders, even though the company, because of the large volume of the order, could have afforded to quote a lower price and still have made a reasonable profit.

CONTROL OF POTENCY AND CONTAINER SIZE

The pharmaceutical agreements fix both the potency and the quantities in which vitamin D concentrates may be sold by the pharmaceutical licensees. The purpose and effect of these additional controls was described by Barney, of the foundation.

We feel that it is perfectly proper to control the price of viosterol and cod-liver oil from a legal standpoint, and unless we control the potency of the product and size of the container, price control of the product, of course, would be rather useless.

The pharmaceutical agreements specified that potencies could be changed only by "mutual agreement of licensees of this group," while container sizes could be changed by "mutual understanding of a majority of the licensees of this group." Operations were in exact accord with these provisions, and only unanimous approval by the licensees could authorize potency changes. Notes of a telephone conversation of March 30, 1932, between Nielsen, of Mead, Johnson, and Russell, of the foundation state:

Russell said under no condition could such approval be given. That Mead, Johnson had no warrant in changing the potency without the knowledge and approval and consent, not only of the foundation but also of the other four licensees.

(Senator Kilgore resumed the chair.)

The CHAIRMAN. Mr. Berge, right at that point, there has been a lot of talk about strait jackets on research and science. Would you call that anything but a strait jacket, or is it just a pair of handcuffs?

Mr. BERGE. It is probably both. Here are five companies, supposed by the public to be competing companies, which, if competing, would like to get business from each other by making a superior product and selling it at the lowest cost possible.

The CHAIRMAN. And as pharmaceutical companies they had laboratories.

Mr. BERGE. Yes, and presumably they might have been able to improve some on the product and on the manner of putting it out, increasing the potency. I suppose that would mean decreasing the unit cost. But here they are, bound up by an agreement which denies them the right to change the potency without the approval and consent of four of their principal competitors.

The CHAIRMAN. The interesting thing, to me, is that not only they joined the foundation, which might have said it was interested in maintaining the purity of the product, but they also joined the com-

Digitized by Google

petitors so that one competitor can't go ahead with any improvements unless the other three agree with him.

Mr. BERGE. That's right. That's certainly a strait jacket or handcuffs, or any other simile which denotes restriction would, I think, be applicable.

BLACKLISTS AND WHITELISTS OF DEALERS

Prior to December 24, 1936, the foundation and its pharmaceutical licensees maintained a very effective black list and white list of dealers. While the approval of dealers was ostensibly within the exclusive control of the foundation, actually it was again a matter for vote by the licensees. L. D. Barney, business manager of the foundation, described the program to Dr. Russell, director of the foundation, in a memorandum dated November 6, 1935, in the following language:

As you know, the usual procedure in handling requests of wholesale drug concerns with respect to their addition to the approved wholesaler list for the sale of viosterol products is for the foundation to send the name and address of this company to the five licensees. They, in turn, investigate the company and report back to us whether or not they favor the addition of the said company to the list. The general procedure set up several years ago was that a majority of the licensees (three) would constitute sufficient authority on the part of the foundation to add the name of the company to the approved list.

By reason of the manner in which these are handled, it is impossible for us to tell the licensee when we refuse their request anything other than the fact that the committee, which handles the request, did not approve their application, or, stated in another way, the committee voted in the negative.

What he is saying is that "we can't tell an applicant who has been rejected, anything except that the committee hadn't approved the application, the committee voted in the negative."

Obviously we cannot say that our licensees did not favor the addition of this company to the group.

Now, if I understand what that means, they didn't want the wholesalers to know that in fact it was the licensees passing on this. If you just said the committee it might be inferred it is foundation action, but the object obviously would suggest illegality on the face of it if the wholesalers knew they had been blacklisted by the vote of the licensees.

The CHAIRMAN. In other words, the foundation descended there to outright deceit.

Mr. BERGE. I think that's what happened.

W. N. Larson, of Mead, Johnson, recognized that this blacklist and whitelist might be illegal, and referred to it in a letter dated December 22, 1936, to Ward Ross, counsel for the foundation. He sent copies to each of the other pharmaceutical licensees. Larson's letter states:

We would have no objection to the foundation acting as a clearing house for information relative to those to whom wholesale terms on viosterol and cod-liver oil with viosterol are extended, except we wonder if such action might not be construed as a violation of law. Anyone investigating this activity might well inquire as to why this was done, if some action which could be construed as collusion or restraint of trade were not contemplated.

One of the principal functions of the blacklisting and whitelisting of wholesalers and retailers was the maintenance of resale prices. This is explained in a letter dated June 29, 1931, from W. N. Larson,

Digitized by Google

of Mead, Johnson, to N. A. Buttle, of Winthrop, with copies to the other licensees and to the foundation. This letter states:

To our knowledge there have been very few departures from the suggested minimum price, and these departures have been confined to a very few relatively unimportant wholesale druggists whose objectives, unlike ours, are not to stabilize conditions in the drug trade. It is the legal right of any manufacturer to refuse to sell to a wholesaler or any other customer in fact, who will not carry out his wishes. I hope that it will not be necessary, but it is entirely possible that it may become desirable, for the foundation to make the list of preferred jobbers a trifle more exclusive than it is at the present time. We would work with the foundation in any reasonable steps in that direction. Better proof of our desire to have this matter straightened out could hardly be given, we believe.

At least as early as 1933 the foundation and the pharmaceutical licensees realized that this blacklist was illegal. On May 1, 1933, Larson, of Mead, Johnson, wrote to Gunn, attorney for the foundation, regarding this blacklist, and said:

Licensees cannot make agreements among themselves in these matters and must, of course, take the position that they are acting under instructions from the Wisconsin Alumni Research Foundation. The revelation that that is not the case might prove to be very embarrassing, as you probably realize. My suggestion is that, in cases of this kind, you simply inform the inquiring party that your action was guided by a committee, operating under the Wisconsin Alumni Research Foundation, and that this committee does not reveal its reasons for taking any action of this kind.

Probably in part on account of this growing disquietude concerning the lawfulness of their undercover boycott, in part also, perhaps, because of the vast amount of detail work involved in maintaining the list, the foundation ceased rendering this service for its licensees some time late in 1936. On December 24, 1936, Barney, of the foundation, referred a prospective wholesaler to the pharmaceutical licensees for direct action.

The pharmaceutical agreements were thus far more than mere restrictive patent licenses. Prices, potencies, dosages, and container sizes were fixed by the licensees jointly and black lists of price-cutting dealers were established and maintained. The foundation offered little more than a facade of respectability to conceal these activities, and it was for this concealment that the licensees were willing to pay so handsomely.

PROTECTION OF PHARMACEUTICAL LICENSES

The remaining agreements of the foundation prohibit the other licensees from invading the pharmaceutical field. Several of the agreements prohibit in express terms sales of activated products for pharmaceutical uses, others so limit the potency of the licensed product as to make it worthless for medicinal purposes, while still others merely limit the right of the licensee to claim curative properties for his product in his advertising.

All the agreements of the foundation clearly show the intention to protect the exclusive market of the pharmaceutical licensees in the human medicine field. Actually this practice is carried to a ridiculous extent. In a memorandum dated November 14, 1935, written by Ward Ross, general counsel for the foundation, regarding a conference with Dr. Hooper, of Withrop, Ross states:

With regard to the comparison between viosterol and drisdol, I asked Hooper how he would like it if our milk licensees said that 1 quart of irradiated milk

Digitized by Google

was equal to 10 drops of viosterol. Hooper claimed that this would be an invasion of the pharmaceutical field by our milk licensees and that they would be selling milk as medicine.

Apparently the licensees are prevented from telling the truthful merits of their products if the truth would cause an overlapping of the artificial division of fields.

BREAD

Another industry capable of using large quantities of vitamin D was the bread industry. Under an agreement dated November 15, 1935, this field is allocated exclusively to du Pont. Du Pont's chief concern in the bread field was price "stabilization," which to du Pont meant the maintenance of high price levels. Du Pont was even willing to share the field with Standard Brands to accomplish this end. A memorandum, dated September 19, 1935, from Mr. Kenneth T. King, of du Pont, to Mr. Ralph Horton and Mr. W. S. Kies, a trustee of the foundation, states:

We would be willing for the foundation to grant nonexclusive license for the sale of vitamin D from ergosterol in the bread field to the Fleischmann Co., providing the price of the vitamin D in the bread field shall be stabilized.

The CHAIRMAN. This word "stabilize" has been used in many of these letters. By stabilization they mean artificial price levels rather than the thing we talk so much about and do so little about, the law of supply and demand with cost and overhead governing a price; isn't that right?

Mr. BERGE. Yes.

The CHAIRMAN. The public thinks of stabilization as a question of supply and demand, the cost of manufacture, the cost of distribution, and a fair profit, but this price stabilization is not designed for stabilization.

Mr. BERGE. This is to fix an artificial price level on it. That is the kind of price stabilization that they mean in agreements of this kind, and we find it all through these price-fixing cases.

Senator HOLMAN. That's the word—"price fixing."

Mr. BERGE. Yes.

The CHAIRMAN. The Wisconsin Research Foundation is not a manufacturing group, is it?

Mr. BERGE. That's right.

The CHAIRMAN. They are simply an agency to control a certain process developed with public funds, and their entire object in life is to allocate that and distribute it to certain preferred licensees.

Mr. BERGE. The foundation holds these patents.

The CHAIRMAN. The foundation has no investment other than their legal investment, office expense, and publicity; is that right?

Mr. BERGE. I understand that in a limited field they sell concentrates which they don't manufacture, but that's in regard to milk.

The CHAIRMAN. In other words, they are dealers in concentrates which are manufactured by others for them?

Mr. BERGE. That's right. They do no manufacturing and they hold these patents and license them on these terms. They have an administrative organization for supervising this work.

Senator HOLMAN. I want to interpose a question at this point. The foundation is operated for personal profit; it's a private corporation; is that correct?

Digitized by Google

Mr. BERGE. Yes.

Senator HOLMAN. What becomes of the accumulated surplus resulting from their operations? Is it distributed to private persons, or is it a public philanthropic fund?

Mr. BERGE. It's set up as a nonprofit corporation, Senator, and these large royalties, according to the articles establishing the foundation, are turned over to the university for research purposes. That is, the income is made available to the University of Wisconsin, and it is stated to be for purposes of research.

The CHAIRMAN. In other words, the record purpose of the foundation is all right if they would change their technique and their method of handling and make the result of this research available. The purpose of the foundation is all right, but the foundation has been warped into a cash register, really.

Mr. BERGE. I am glad to make it clear that we are not complaining here that the moneys realized from these royalties are spent for any ulterior or improper purpose. I stated that it goes to the University of Wisconsin for research; I also stated that the university does not control the foundation, nor is there any formal connection. In other words, I would say that the position of the university with respect to the receipt of these funds is about the same as the university's position would be with respect to any donor. Most of our public universities, as well as our private institutions, receive gifts from wealthy alumni, or from the wills and bequests of persons who leave the residuary interest of their estates for the establishment of a foundation or fund for research or science or law or other purposes, and I don't take it that the recipients of the bequests thereby undertake to guarantee the legitimacy or the purity of all the activities of the donors. I don't think it is any reflection on my own alma mater that she has accepted certain bequests from industrialists who may have been engaged, in the early days of our history, in cutthroat practices.

Senator HOLMAN. There are certain persons in this foundation who are devoting their time and talents to its operations. Have you explored their participation, if any, in the receipts, in the form of salaries, commissions, bonuses, or what not?

Mr. BERGE. I don't think we have; but I don't think there is any suggestion intended that their own personal receipts are improper.

Senator HOLMAN. I just want the record. I am not drawing a conclusion.

Mr. BERGE. Certainly. I am answering the question as best I can. We have not particularly explored that, but there is nothing that I have to indicate—and I say that not as argument but as a factual statement—that there is any improper receipt of moneys by the trustees or employees of the foundation. They are salaried men, the employees, and the trustees serve free, but the salaried men are doing this job which is provided for in the set-up of the organization.

The CHAIRMAN. The point in this is that a product developed by public funds, with the idea of being of immense value to the Nation, has been whipped around by agreements to such an extent that it is not rendering that service for which the foundation and the talents of the original men were expended.

Mr. BERGE. Yes.

Digitized by Google

The agreement between du Pont and the foundation expressly stipulates the limits of licenseess' descretion in price policy. Article 2 (C) provides:

> Du Pont shall not sell said irradiated or activated ergosterol or its derivatives at a higher price than one dollar and a half ($1.50) or at a lower price than ninety-five cents ($0.95) per million U. S. P. A. (revised 1934) vitamin D units.

Mr. SCHIMMEL. That is, regardless of the cost of manufacture, those are to be the prices?

Mr. BERGE. That's right.

The foundation's support of du Pont's policy of high prices is indicated in a letter dated July 18, 1935, from Barney to Atkins, of du Pont, which states:

> Dr. Waddell stated that it was his opinion that if General Baking came back into the picture a higher price for ergosterol should be charged. We discussed the possibility of a price of $1.25 to $1.50 per million Steenbock units.

So long as the foundation could be "merciless in beating out competition" price fixing at these levels was quite attractive. But by 1940 the weakness of the Steenbock patents was so apparent that the fixed prices became a competitive hazard. On March 5, 1940, King of du Pont wrote to Barney of the foundation stating:

> In reply to your letter of February 24 we are very much interested in modifying our contract with respect to the maximum and minimum provisions in the baking field. In fact, we believe the simplest way to handle this question is to delete from our present contract the clause specifying maximum and minimum provisions. This, of course, was explained to you over the telephone in our recent conversation concerning General Baking. I believe unless some change is made in the maximum and minimum provisions all business in this field will be lost by the licensees of the foundation.

I take it that what that means is that the growing consciousness of the weakness of this patent under which they were working had them all uneasy that they wouldn't be able much longer to control the situation. Companies would step into this field and break the price structure and go ahead and make these products, because the effect of the licenses was losing its potency.

The foundation recognized the need for abandoning these artificially high price levels and on March 14, 1940, Barney of the foundation wrote to King of du Pont referring to a "quotation from General Mills at a price of 60 cents per million" and stated:

> This will acknowledge receipt of your letter of March 5 regarding the maximum and minimum price provisions with respect to the baking field. Shortly, Ward [Ross, of the Foundation] will send Art [Connolly, of du Pont] either a letter agreement or supplemental contract deleting this provision from the contract.

On July 19, 1940, Connolly wrote Ross again, asking elimination of the price-fixing provision and finally on July 30, 1940, Ross, of the foundation, wrote to du Pont deleting the price-fixing paragraph from article 2 (C) of the agreement.

PRICE

Du Pont's aim in all of its vitamin D operations was to obtain high, noncompetitive prices for its products. This thought is expressed time

Digitized by Google

and time again. A memorandum dated July 26, 1932, from Bradshaw to Atkins, both of Acetol, states:

This morning I reported to Mr. Protto and Mr. Robinson regarding conversation with Dean Russell and also the known facts concerning Lever Bros. business. It was Mr. Protto's feeling that we should raise our prices as much as possible and "should" not sell the material cheap.

The next day Atkins replied:

It seems obvious to me that we should always try to get the maximum price for any of our goods, keeping in mind the possible potential volume and competitive conditions.

According to authentic price information which we have secured, Fleischmann have been selling and offering vitamin D at slightly less than $1.00 per 1,000,000 Steenbock rat units. This is what influenced my suggested price of $1.00 to Lever Brothers, and I was very much surprised when you informed me that Fleischmann was not in position to furnish irradiated ergosterol. If this were true, I apparently had gone too low on our initial price in view of the fact that we were the exclusive source of supply.

The profit levels resulting from the foundation's activities were enormous. In a letter dated March 9, 1938, addressed to Ward Ross, of the foundation, King, of du Pont, states:

With respect to the Chesney matter, all I know is that 35 cents per million units was quoted to General Baking Co.

MILK

Vitamin D is of the greatest importance to expectant and nursing mothers, infants, and children and, consequently, milk is one of the most natural and most important vehicles for this vitamin. The Council on Foods of the American Medical Association stated in the Journal of the American Medical Association for January 16, 1937, "Of all the common foods available, milk is most suitable as a carrier of added vitamin D. Vitamin D is concerned with the utilization of calcium and phosphorus, of which milk is an excellent source." Next to the pharmaceutical industry, milk was probably the most promising outlet for vitamin D from a profit standpoint. The foundation therefore became active in promoting the use of vitamin D in the milk industry.

EVAPORATED MILK

On November 1, 1938, the foundation granted licenses to five producers of evaporated milk, the Borden Co., Carnation Co., Indiana Condensed Milk Co., Nestle's Milk Products, Inc., and Pet Milk Co., to activate evaporated milk. The agreements allocate the evaporated-milk field exclusively to these five producers.

Like the foundation's other agreements, these evaporated-milk agreements provide for the maintenance of the division of fields. Article XX, in protecting the evaporated-milk field, states:

The licensor agrees that in all licenses granted by it for the activation of fluid milk by the use of irradiated ergosterol or by direct application of ultra violet rays, it will incorporate a provision preventing the use of or sale of such activated milk by such licensees for the manufacture of activated unsweetened evaporated milk.

Digitized by Google

The rights of the evaporated-milk producers were similarly restricted to prevent encroachment on other exclusive fields. Article XII specifically protects the pharmaceutical field by providing—

* * * said evaporated milk shall not be intended or sold as a cure for rickets.

The other fields of use of vitamin D are protected from invasion by activated evaporated milk by article IX, which provides:

The licensee agrees that it will not knowingly directly or indirectly sell its unsweetened evaporated milk activated under this license to others * * * as a source of vitamin D for any other product when such product is intended to be sold or resold on a commercial basis.

FLUID MILK

There are several methods by which fluid milk may be activated, and the foundation has issued licenses for each of these methods. In one method, irradiated yeast is fed to cows to increase the vitamin D content of the milk; in the second method, the milk is irradiated directly; and in the third method, an activated concentrate is introduced into the milk.

The bill of particulars in the *Vitamin Technologists* suit lists 138 dairies licensed to activate milk by feeding irradiated yeast to cows. In this agreement with West Haven Creamery, Inc., which is typical of all of the licenses of this class, the foundation—

does license and empower the licensee to purchase from Standard Brands, Inc., dried yeast antirachitically activated * * * upon the following terms and conditions:

First. The licensee shall buy and use such yeast for no other purpose than that of feeding cows to impart antirachitic qualities to milk.

* * * * * * *

Fourth. The licensee shall not sell any of its antirachitically activated milk to others for use or incorporation in any other marketed product when vitamin D or antirachitic claims are made or intended to be made for such other marketed product.

Fifth. The activated yeast purchased by licensee pursuant to this license shall not be resold or otherwise used except for feeding the same to licensee's animals, pursuant to the conditions of this license.

The CHAIRMAN. In other words, under these licenses, they are not only licensed in the production of the product, but they also stipulate to whom those products could be sold and, to the purchaser, the purpose for which the products could be used.

Mr. BERGE. They covered all those things.

The CHAIRMAN. If a small creamery wanted to buy some of that treated milk, the dairy couldn't sell it to the creamery, although the dairy had produced the milk. The manufacturers of yeast sell it to dairies and farmers unless they get a license to permit the purchase from the manufacturer.

Mr. BERGE. That's right.

The CHAIRMAN. I wonder when they are going to ask babies to get licenses to take the pills.

Mr. BERGE. The Steenbock patents do not purport to cover anything more than a process of irradiating or an irradiated product. Under no circumstances could the milk from an irradiated-yeast-fed cow be an infringement of the Steenbock patents. Article 4 is a barefaced attempt to carry out the artificial division of fields. Milk from an

Digitized by Google

irradiated-yeast-fed cow could, for example, be used in the commercial making of bread, but such use would be an invasion of the exclusive bread and breadstuffs field. It was, therefore, necessary for the foundation to insert this limitation in the West Haven Creamery's license even though the limitation was entirely outside the Steenbock patents.

The prohibition of resale in article 5 likewise lacks any taint of legal justification. A patentee's right under a patent is completely exhausted by the first sale of the patented product. Here again the foundation is seeking to prevent any use of the irradiated yeast which may in any way conflict with the division of fields.

As the demand for activated milk increased, the addition of concentrates was accepted by the medical profession. This business was so attractive that the foundation decided to engage in the sale of these concentrates for addition to milk. The foundation did not, however, wish to enter a market in which any competition existed, and since Standard Brands had rights in this field it was essential that the Standard Brands competition be eliminated. In the agreement of February 1, 1939, the foundation agreed to pay Standard Brands 40 percent of the profits derived by the foundation from the sale of concentrates in return for Standard Brands' withdrawal and agreement not to compete.

POULTRY FEED

Vitamin D–3 is of the utmost importance in the poultry industry since it is essential for the prevention and cure of rickets and for bone development, egg production and hatchability. Food and Life, the Yearbook of Agriculture for 1939, published by the United States Department of Agriculture states, on page 818, that the vitamin D requirements of chickens and turkeys are as follows:

CHICKENS

	Chick units per pound of feed
Growing chicks	180
Laying stock	360
Breeding stock	540

TURKEYS

Growing poults	360
Breeding stock	540

Prior to the war some of this vitamin D could be obtained from cod- and other fish-liver oils, but at the present time the requirements must be obtained almost exclusively from synthetic vitamin D.

Even apart from wartime shortages, synthetic vitamin D presents certain advantages over fish-liver oils. The synthetic product may be used for forced feeding without adversely affecting the flavor of the poultry, while too generous use of fish-liver oils results in a somewhat fishy flavor.

The size of the poultry market in the United States involves almost astronomical figures. The crop report of September 1, 1943, of the United States Department of Agriculture on poultry and egg production states that there were over 316,000,000 laying hens, over 318,000,000 pullets, and over 224.000,000 chicks. The egg production for August 1943 was 3,863,000,000. This crop report also states that the average

Digitized by Google

cost of feed for farm poultry ration on August 15, 1943, was $2.13 per hundred pounds. Dr. Harry Titus, of the Poultry Nutrition Section of the Bureau of Animal Industries of the Department of Agriculture, estimates that 25,000,000 tons of commercial mixed feed is used annually in the poultry industry and that 75 percent of this feed is fortified with vitamin D.

The wartime demands on meat make the poultry market unusually important and any artificial restraints or artificial price levels affecting the poultry market are of the most serious national importance.

The discovery upon which Steenbock's patent No. 1,680,818 is based is that certain substances, known as provitamins, take on antirachitic properties when irradiated with ultra-violet light. These provitamins are sterols which may be obtained from either vegetable or animal sources and the effectiveness of the irradiated product is dependent upon the nature of the provitamin.

In the early days vegetable provitamins were used almost exclusively, but it was subsequently found that the animal provitamins were superior. Vegetable provitamins were unsuitable for poultry feeding and the exploitation of this market awaited the development of the animal provitamins, cholesterol and 7-dehydrocholesterol.

The animal- and poultry-feed field had been exclusively allocated to du Pont and its predecessor, Acetol. This exclusive arrangement high lights the artificial nature of the foundation's division of fields. In the case of cows, vitamin D in the feed will result in a vitamin-D content in the milk. Vitamin D may also have some antirachitic effect on the cow itself. In interpreting this provision of its agreement with the foundation, du Pont was obliged to consider the question whether the effect of the vitamin-D feed is in the cow or in the milk. Finally, however, du Pont resolved the doubt in its own favor. A letter dated February 20, 1935, addressed to Kupperian of du Pont, from Connolly, a du Pont attorney, states:

> Irradiated cholesterol may, therefore, be used in feed for cows regardless of whether its purpose is to enhance the vitamin-D content of the milk or to prevent rickets in the cow itself.

Prior to 1936 du Pont recognized the importance of the animal sterols, cholesterol and 7-dehydrocholesterol, in the poultry-feed field. Du Pont immediately set out to secure a monopoly over these provitamins and through them to control the entire poultry-feed field. The first step in this direction is described in a letter dated January 21, 1936, from King, of du Pont, to Nielson, of Abbott, which states:

> We were, of course, largely interested in the poultry field, and to protect our position had made tentative arrangements to secure all of the available cholesterol in the country, or perhaps we might say, in the world.

Apart from attempting to corner the sources of animal sterols, du Pont also sought exclusive rights in the field of animal sterols within the licensing scheme of the foundation. The agreement of November 15, 1935, between the foundation and du Pont grants du Pont an exclusive license to irradiate sterols from animal sources. When the foundation wished to grant new licenses and submitted the proposed licenses to du Pont for approval, du Pont insisted upon retaining exclusive rights in the animal provitamin field. In a report to the

Digitized by Google

executive committee of du Pont recommending approval of the foundation's license to Merrell, E. G. Robinson states:

> The foundation now wishes to grant a license to the William S. Merrell Co. of Cincinnati, Ohio, limited to vitamin D from nonanimal sources for sale only as medicinals or pharmaceuticals for human use, which this department is willing to approve. It is limited to nonanimal sources in the pharmaceutical field and, therefore, we do not think it will materially interfere with our own developments. Also, the foundation is able to grant a license with respect to yeast ergosterol without our permission, since that product is not in our license field; and if the license to Merrell is limited to yeast we will not have the opportunity of selling Merrell our own [irradiated] ergosterol.

Thus, while du Pont wishes to protect its animal-sterol field it did not wish the Merrell license so limited as to deprive du Pont of a potential market for nonyeast ergosterol. In both of these desires the foundation was most willing to cooperate.

DU PONT-ALBA-PHILIPS ARRANGEMENTS

Alba Pharmaceutical Co. and N. V. Philips Gloeilampenfabrieken, of Holland, did some development work in the vitamin D field and obtained patents relating to the production and use of animal sterols as sources of vitamin D. Despite its exclusive license from the foundation and its corner on the cholesterol market, du Pont found it desirable to enter into license agreements with Alba and Philips to round out the control over the animal-sterol field. These license agreements bring Alba and Philips into the orbit of the foundation's licensing scheme and pile a new cartel on top of the old. The agreements and relationships between these parties are quite involved and an exposition of them will be reserved for a more complete report.

CONCLUSION

All of the foregoing restrictions and controls were practiced by the foundation under the guise of an exercise of its rights under the Steenbock patents. For years the foundation was successful in avoiding any test of the validity or scope of these patents, but, finally, on September 15, 1939, the foundation filed suit against Vitamin Technologists, Inc., in the southern district of California charging infringement of Steenbock patents Nos. 1,608,818, 1,871,136, and 2,057,399. The validity of these patents was finally considered by the Circuit Court of Appeals for the Ninth Circuit in *Vitamin Technologists, Inc.*, v. *Wisconsin Alumni Research Foundation* (136 F. (2d) 318). In arriving at its decision the court relied almost entirely on the testimony of Steenbock himself and another expert witness presented by the foundation. The court states at page 319:

> Many years before the application, science had discovered that the sun's rays shining on cut alfalfa hay cured in the field was an antirachitic food for pigs. Prior to 1923 foundation's expert witness, Dr. Nelson, testified that it was shown as a natural process that vegetable matter, not only cut hay but copra, the cut meat of the coconut, when exposed to the sun's ultraviolet rays, would produce in it vitamin D.
>
> Steenbock himself verified the facts concerning alfalfa by the discovery that when cured out of the sunlight it lacked the antirachitic quality created when cured in the field.
>
> We thus have the claimed inventor proving that is from the ultraviolet rays of the sun that the alfalfa acquires its vitamin D, that is by the process claimed

Digitized by Google

by him as patentable. If the patent be valid, it is thus seen that the farmer is an infringer when he exposes his cut alfalfa to the ultraviolet rays of the sun long enough to make it antirachitic. So also the long-previously established practice of the radiation of milk by the mercury vapor lamp would infringe the monopoly of Steenbock's patent because admittedly, in its customary use it would produce in the milk vitamin D.

The court then says (p. 321):

We hold that the first patent (1,680,818) is invalid because it was old in the art to expose various foods of dietary value, such as olive oil and milk, to lamp radiated ultraviolet rays, and ages old to expose cut vegetable matter to such rays of the sun.

The same reasoning makes invalid the second patent (1,871,136) * * *.

* * * * * * *

* * * the third patent (2,057,399) is void for a double attempt to patent an unpatentable process.

In a concurring opinion at page 322, Judge Healy states:

But I agree that Dr. Steenbock did not invent anything.

Thus, this entire scheme for exploiting the public was based upon patents which in their court test were invalidated on evidence and testimony of the inventor and other witnesses supplied by the foundation. Not only were the practices and restrictions of the foundation indefensible in themselves, but even the basis of the practices and restrictions was held to be void and of no effect.

Probably one of the best summaries of the foundation's practices is contained in the statement of Dr. Morris Fishbein, president of the American Medical Association, who said:

The sun in the sky should be freely available to all who wish to use it. Yet it has been hinted that there are some concerned with patents on vitamin D who would even inhibit investigators from experimenting with the sun.

The CHAIRMAN. If there had been a uniform policy on the disposition of patents and research findings procured by Government funds in an agency such as is contemplated in S. 702 to protect the public interest and to promote the widest possible use of Government-financed research, would it be likely that a monopoly such as has been described here today would be created, and that the curbing of research and further development by private enterprise would be possible?

Mr. BERGE. I don't see how it could have been. I think if some such plan as that contemplated by this bill had been in effect, it would have covered such a situation, and that if the research that Steenbock did, and that went into developing the process of utilizing vitamin D, had been done under the plan contemplated by S. 702, these abuses could not have been possible, as I see it.

The CHAIRMAN. Mr. Berge, in other words, Steenbock was not a party, really, to this. He offered his process originally to the University; is that not right?

Mr. BERGE. Yes.

The CHAIRMAN. And the foundation later took it up.

Mr. BERGE. He offered it to the university who turned it down, and later the foundation took it up.

The CHAIRMAN. The reason I asked that last question is this: That Dr. Egloff, who is director of research of Universal Oil Products Co., which is a patent monopoly, has made his principal complaint on S. 702 that it puts a strait jacket on research and would hold back

Digitized by Google

public research of any kind; that it also puts a strait jacket on private research. Can you, in your wildest vision, visualize a worse strait jacket than the one put on this, which was a publicly developed process?

Mr. BERGE. I can't think of one. I also can't see how there can possibly be any merit to the contention that such a plan as the proposed bill contemplates could put a strait jacket on development. Certainly a public agency, assuming an active interest in promoting and directing research, with provisions for unrestricted licensing of the patents developed at such public expense, whatever else may be conjured up in criticism of it, cannot be criticized as being restrictive.

The CHAIRMAN. You remember back in about 1933, when the papers were full of an expression called "rugged individualism" as being an American characteristic. It was largely emphasized by some of the concerns that we have mentioned in these hearings, as I remember. Can you see any tendency toward rugged individualism in this history or the history produced last Thursday, or can you see any opportunity for rugged individualism by industry?

Mr. BERGE. I think these situations which were referred to last week, and which I developed today, offer the greatest threat to rugged individualism that is present on the economic scene today. I think if there is anything that tends toward defeating freedom of enterprise, and toward creating tight control and regimentation within an industry, it is these restrictive devices, through cartel arrangements of the kind discussed the other day, and through an elaborate system of licensing control, such as I have discussed today. Of course, my own private opinion is that if allowed to continue indefinitely, they will choke private enterprise to a point where some more extreme form of public control will be an absolute requisite, if we are to function at all, a form more extreme, I am sure, than we should like to have. If we are going to have free enterprise it must have some room to stretch around in, and these private controls certainly shut off development in an industry and, for a few years, perhaps, will assure high profits to particular groups, but in time they will have such a stifling effect on our economy that we will all go under. That, of course, is my private opinion, but I think it follows, as I see the picture.

The CHAIRMAN. Still speaking as one lawyer to another and not in an official capacity, do not these practices of artificial price level fixing raise the cost of living, thereby necessitating an artificial wage level also, and thereby taking us out of the international field of commerce, to a certain extent, which is the purpose of cartels with Farben and various other foreign concerns whose purpose it is to move us out as competitors in the international field?

Mr. BERGE. I think that's correct. In the domestic economy, too, restrictions on production, price-fixing arrangements such as we have discussed today, I think, can have no worse effect than to reduce the consumption of the product, and then these direct restrictions reduce the production. Now, the total effect is to mean less labor, fewer people producing, and that means, again, less purchasing power and we get a vicious downward spiral. I think our ideal ought to be toward the full production with a minimum of restrictions, and where restrictions are necessary because of some special conditions in an industry, I think they must then be under Government control. I hope and I

Digitized by Google

believe that in the long run there won't be need for many restrictions on production or price restrictions at all, but where that may be necessary, because of some special reason, we can't leave it to the private concerns, because then the public interest is left out of account. The ideal is maximum production, entirely free price competition, and, I think, licensing of patents without restriction, either free, or at least with reasonable royalties, so that everybody with vim, vigor, interest, and capacity may go into a field and risk his money in developing an enterprise.

I think everyone should have his chance. That's the spirit which developed America, and I think it's the only spirit that can save the kind of economy we want to preserve.

The CHAIRMAN. I was told some months ago by a man connected with one of our large radio patent groups that they removed their restrictive practices when they discovered their profits dropping off. They did so as an experiment and entered into a system of licensing anybody, thereby forcing all the others to come into the same system, and, strange to say, the profits of that particular group increased tremendously, because whereas formerly you would have 1 radio to every 15 or 20 homes, it was suddenly discovered that when the restrictions were removed the price of radios dropped, competition and cost of production became the governing factor, and then we had 2 or 3 radios in every home. So that the reduction, in reality, coupled with free competition between manufacturers as to the best manufacturing methods, produced, to this particular group, a greater profit than the restrictive measures with the high royalties had formerly produced.

Mr. BERGE. That's certainly interesting, and you might say it's a laboratory demonstration of the theory I have been expounding. I have a notion that would be found to be true in the whole field.

The CHAIRMAN. Don't you think also that eventually practices of this kind are going to lead to governmental interference in the patent field to such an extent that the patent structure will be far more seriously affected than would the proposal in 702, which does not touch the private patent structure but does make more available the patents developed with public funds?

Mr. BERGE. My own opinion is that that is what will happen if some more moderate measures that don't fundamentally affect the patent structure are not adopted.

Mr. SCHIMMEL. There are a couple of points I'd like to make. Would you minimize Steenbock's discoveries because they were not patentable?

Mr. BERGE. No.

Mr. SCHIMMEL. I think that's a troublesome point there. Would the fact that the court ruled they are not patentable minimize the scientific merit of the discovery?

Mr. BERGE. I don't think it necessarily would. Of course, we are not scientists, but it seems to me that the idea should be to encourage scientific research and development to get processes improved, whether or not the new twists that are developed are patentable. This may have been a very important contribution or it may not have been. I don't know. It seems to me, however, that the fact of whether or not it is patentable should not determine the kind of development it

Digitized by Google

should enjoy. I think that, patentable or unpatentable, any improvements, however slight, in scientific processes ought to have a clear field for development on their merits.

Mr. SCHIMMEL. That raises a very important point about this whole testimony, Mr. Berge. Here we have a development financed by Federal funds, as I understand your testimony.

Mr. BERGE. In part it was; yes.

The CHAIRMAN. And the rest was by State funds.

Mr. SCHIMMEL. Do you have any record of any Federal agency having made any study to see in what way this development should be utilized?

Mr. BERGE. You mean the Steenbock development?

Mr. SCHIMMEL. Yes.

Mr. BERGE. We don't have any record that any Federal agency ever considered the matter at all.

Mr. SCHIMMEL. Ten years later we find that a legal division of the Federal Government has come in and made an exhaustive study of the problem, because certain practices, which may or may not border on the criminal, have taken place with respect to that development.

Mr. BERGE. That's right.

The CHAIRMAN. In other words, certain practices which restricted the utilization of it were studied.

Mr. SCHIMMEL. In other words, we are operating, in the Federal Government today, with a legal agency to take care of the crime after it has been committed. We have no operating agency in the scientific field to see that the crime is not committed in the first place.

Mr. BERGE. That's right; that's right. While this doesn't reflect an answer to your question, Mr. Schimmel, I think the question of legal violation is involved. I might repeat what I said at the first, but I think it's a little clearer now and that is that this matter was investigated because of what seemed to be abuses in the control of the development of the process and all these restrictive practices. During the course of the investigation, however, it also became clear that the whole system was pyramided upon the patent itself, and we learned of this private patent litigation, out of which, conceivably, the whole structure might topple because of the invalidity of the patents. Antitrust action was deferred pending the outcome of that litigation, and now the Court of Appeals has held the patent invalid. I don't know whether the matter will be taken up on appeal or not, but of course if the lower court decision stands, that may raise a question as to whether it is essential to proceed by antitrust proceedings at all. The explanation of our delay is found in the fact that the whole basic patent was being questioned in this private litigation.

The CHAIRMAN. Mr. Berge, that brings up one point that I think is interesting, and that is that there are many unpatentable research developments that can be of tremendous value to the people of the United States, and they are not going to be gone into by private research because there is no chance for profit. Therefore this fundamental research must be carried on to some measure out of public funds from some source, and at the present time, except in the field of agriculture, we have no such funds.

Mr. SCHIMMEL. I think the very interesting point about this whole testimony is that we were spending probably one-tenth or one-twentieth

Digitized by Google

as much for scientific research in 1929 as we are spending today. When I say "we" I mean the Federal Government. Here we have an example of the result of that. If that research is not adequately protected, we get the result which Mr. Berge has brought out today.

Mr. BERGE. There is one correction for the record that should be made because we inadvertently, on page 9 of this mimeographed copy, mention Nielsen, of E. R. Squibb & Sons. It should read Nielson, of Abbott Co.

The CHAIRMAN. We will recess now until further call when Mr. Berge's further testimony is prepared.

(Whereupon, at 12:20 p. m., the subcommittee recessed subject to the further call of the Chair.)

EXHIBIT No. 155. VITAMIN D

UNITED STATES DEPARTMENT OF AGRICULTURE,
Washington, D. C., October 22, 1943.

Mr. R. M. HUNTER,
Department of Justice, Washington, D. C.

DEAR MR. HUNTER: This will confirm my statement to you by telephone that the research of Dr. Harry Steenbock, a staff member of the Wisconsin Agricultural Experiment Station, has been supported in part by Federal-grant funds. In view of the many lines of work involved in the Wisconsin station nutritional research program, it is not possible to estimate with any degree of certainty the amount of Federal-grant funds or the amount of State funds properly chargeable to the specific work of Dr. Steenbock relative to irradiation of foods. The facts of the case are briefed as follows:

The irradiation of foods is one of several findings of practical significance resulting from a program of research initiated at the Wisconsin station in 1906 immediately following the approval of the Adams Act of March 16, 1906.

The total program up to 1924 was financed under two Federal-grant fund projects and from contributions from State funds. These projects were started shortly after the Adams funds became available under the following titles:

No. 3. Importance of Mineral Constituents of Feeding Stuffs in the Growth and Development of Farm Animals.

No. 4, Comparison of Nutrients from Single Plant Sources and from Different Plants on Development of Animals.

As the investigations proceeded a number of important findings relative to animal nutrition were developed, for example, in 1914, the research showed that vegetable fats when added to certain basic diets did not induce growth, but butter and some other animal fats did.

In 1915 it was found that 1 percent ash enabled animals to grow, 2 percent enabled reproduction, and 3 percent enabled them to raise young. The following year (1916) advances were made in the determination of the chemical structure and stability of what was then known as accessory bodies A and B (now called vitamins A and B). In 1918 animal growth was inhibited by withholding calcium, potassium, and chlorine from their diet. In 1919 the research workers found that white corn is deficient and yellow corn rich in vitamins A and B. In 1920 it was found that vitamin A in yellow corn is confined to the endosperm and not present in the embryo. In 1923 they found greater storage of calcium in cows fed fresh green alfalfa, and found that many commercial mineral mixtures contain useless ingredients and showed the value of bonemeal, wood ashes, and ground limestone.

Irradiation of foods.—In 1923 the discovery was made that certain foods when irradiated with ultra-violet light acquire antirachitic value. This was published in 1924 in the following paper:

Fat-soluble Vitamins. XVII, The Induction of Growth-promoting and Calcifying Properties in a Ration by Exposure to Ultra-violet Light, J. Biol.

Digitized by Google

Chem., 61 405–422 (1924), by H. Steenbock and A. Black (Wisconsin Station).

Even in 1923 and 1924 other new findings and advances were made. For example, in 1924, it was announced that the inorganic phosphorus content of the blood was lower in animals enclosed in dark pens than those in pens receiving light.

The investigations in connection with this program of research thus included studies of different feeds and combinations of feeds and supplements for different animals under different environmental conditions.

Research in a field like animal nutrition is inevitably a world-wide undertaking in which each worker benefits from the findings of other fellow-workers who publish their results, and they in turn benefit from what he accomplishes. Dr. Steenbock has publicly acknowledged his indebtedness to the research in vitamin D conducted at the Lister Institute and by Mendel and Osborne.

In a very real sense, therefore, it can never be possible to measure in financial terms, or in any other accurate manner, the aid which a given scientist or inventor received from a particular fund of money. The research conducted at the Wisconsin station with money supplied from the Adams fund, when reported in the scientific literature, undoubtedly aided nutrition workers throughout the world in carrying forward their researches.

It, therefore, should be emphasized that the mere receiving of part of his salary from the Adams fund allotment to the Wisconsin station was only one of the very many sources of aid to the research which he has had underway during the past 30 years. It is impossible to evaluate these contributions in terms of money, or to allocate equities belonging to appropriating agencies or to scientists working in other laboratories throughout the world.

Very truly yours,

JAMES T. JARDINE.
Chief, Office of Experiment Stations.

IN THE UNITED STATES DISTRICT COURT, SOUTHERN DISTRICT OF CALIFORNIA

CENTRAL DIVISION

No. 565–M Civil

Wisconsin Alumni Research Foundation, a Corporation, Plaintiff, v. *Vitamin Technologists, Incorporated, a Corporation, Defendant*

PLAINTIFF'S BILL OF PARTICULARS AND MORE DEFINITE STATEMENT

Pursuant to orders of this Court of November 29, 1939, and December 8, 1939, requiring plaintiff to comply with certain paragraphs of defendant's motion for an order requiring plaintiff to file a bill of particulars or a more definite statement under Rule 12 (e) of Federal Rules of Civil Procedure, plaintiff submits the following particulars with respect to paragraphs 1, 2, 3, 4, 5, 7 (a), 7 (b), 10 (a), 11 (a), and 11 (b) of defendant's motion:

1. Plaintiff is informed and believes, and therefore, avers that the following claims of the patents in suit have been infringed by defendant:

Patent No. 1,680,818—Claims 1, 2, 3, 5, 6, and 8.
Patent No. 1,871,136—Each and every claim.
Patent No. 2,057,399—Each and every claim.

Plaintiff's specification of the foregoing claims of the patents in suit is based upon (a) plaintiff's knowledge of the products sold by defendant, (b) information secured as a result of plaintiff's inspection of certain of the processes and equipment employed by defendant in its plant at 947 South Maple Avenue, Los Angeles, California, pursuant to the order of this court of November 29, 1939, regarding such inspection; (c) information given orally to plaintiff's representatives by certain of defendant's officers and attorneys at the time of such inspection; and (d) defendant's description of its alleged secret process, filed by defendant and served upon plaintiff's attorneys pursuant to said order of November 29, 1939. Plaintiff reserves the right upon final hearing to differently specify claims of the patents in suit as charged to infringe should further information be hereafter secured by plaintiff, justifying such specification.

Digitized by Google

2. The processes and products of defendant are charged to infringe the above specified claims of the patents in suit as follows:

(a) Defendant's alleged secret process, as set forth in defendant's description thereof, infringes claims 1 and 8 of patent No. 1,680,818 and claims 1–3, both inclusive, of patent No. 1,871,136.

(b) The product of defendant's alleged secret process infringes claims 5 and 6 of patent No. 1,680,818 and claims 4–7, both inclusive, of patent No. 1,871,136.

(c) Defendant's process of irradiating ergosterol in sesame oil infringes claims 1, 2, 3, and 8 of patent No. 1,680,818 and claims 1–3, both inclusive, of patent No. 1,871,136.

(d) The product of the process referred to in (c) above, namely, irradiated ergosterol in sesame oil, infringes claims 5 and 6 of patent No. 1,680,818 and claims 4–7, both inclusive, of patent No. 1,871,136.

(e) Defendant's process of irradiating ergosterol in alcohol infringes claims 1 and 8 of patent No. 1,680,818 and claims 1–3, both inclusive, of patent No. 1,871,136.

(f) The product of the process referred to in (e) above, namely, irradiated ergosterol in alcohol, infringes claim 5 of patent No. 1,680,818 and claims 4–7, both inclusive, of patent No. 1,871,136.

(g) Defendant's product in dry form, namely, irradiated ergosterol combined with a dry carrier, infringes claim 5 of patent No. 1,680,818 and claims 4–9, both inclusive, of patent No. 1,871,136.

(h) Defendant's process of irradiating yeast infringes claims 1 and 8 of patent No. 1,680,818 and claims 1, 2 and 4 of patent No. 2,057,399.

(i) The product of the process referred to in (h) above, namely, irradiated yeast, infringes claim 5 of patent No. 1,680,818 and claim 3 of patent No. 2,657,399.

3. Attached hereto as "Exhibit A" is a true and correct copy of the assignment referred to in Paragraph 5 of the complaint.

4. Attached hereto as Exhibit "B" is a true and correct copy of the assignment referred to in Paragraph 7 of the complaint.

5. Attached hereto as "Exhibit C" is a true and correct copy of the assignment referred to in paragraph 9 of the complaint.

7 (a) Attached hereto as "Exhibit D" is a document entitled "Names and Addresses of Certain Present and Former Licensees of Plaintiff under the Steenbock patents."

7 (b) Attached hereto as "Exhibit E" are true and exact copies of license agreements between plaintiff and those licensees referred to in paragraph 7 (a) above, now operating under said license agreements, the set of copies being collectively entitled "Copies of License Agreements."

10 (a) In response to paragraph 10 (a) of defendant's motion, plaintiff refers to paragraph 13 of the complaint. Plaintiff will prove that defendant's infringement of the patents in suit was willful by showing (1) that defendant knew of the existence of the patents in suit at the time it commenced the practices complained of and (2) that defendant continued said practices after being notified of its infringement by plaintiff.

11 (a) Plaintiff notified defendant in writing of its infringement of the patents in suit by registered letter, dated October 26, 1936. Plaintiff reiterated its charges of infringement in a letter to plaintiff's counsel dated November 24, 1936.

11 (b) Attached hereto as "Exhibit F" are true and exact copies of the two written notices of infringement given, sent and delivered by plaintiff to defendant.

Dated Chicago, Illinois, January 18, 1940.

WISCONSIN ALUMNI RESEARCH FOUNDATION,

By GEORGE I. HAIGHT,
FRANK PARKER DAVIS,
WARD ROSS,
LEWIS W. ANDREWS,
MORTIMER KLINE,

Its Attorneys, 414 Union Oil Bldg., 617 W. 7th St., Los Angeles, California.

EXHIBIT A

Whereas, I, HARRY STEENBOCK, of Madison, County of Dane and State of Wisconsin, have invented a certain new and useful invention for Antirachitic Products and Process, for which I have made application for Letters Patent of the United States, Serial No. 723,171, filed June 30, 1924; and

Digitized by Google

Whereas, the WISCONSIN ALUMNI RESEARCH FOUNDATION, a corporation not for pecuniary profit, is desirous of acquiring an interest in said invention, and in the Letters Patent to be obtained therefor;

Now, therefore, to all whom it may concern, be it known that for and in consideration of the sum of ten dollars ($10.00), to me in hand paid, receipt of which is hereby acknowledged, I, the said HARRY STEENBOCK, have sold, assigned, and transferred and by these presents do sell, assign, and transfer unto the said WISCONSIN ALUMNI RESEARCH FOUNDATION, the whole right, title and interest in and to the said invention for Antirachitic Products and Process, and any improvements thereon which I have made or may hereafter make, and in and to the Letters Patent and the applications for Letters Patent therefor, aforesaid, and to any foreign applications for patent pending thereon, or to be filed thereon, and upon improvements upon the same and all other foreign rights, the same to be held and enjoyed by the said WISCONSIN ALUMNI RESEARCH FOUNDATION for its own use and behoof and for the use and behoof of its legal representatives, to the full end of the term for which said Letters Patent are or may be granted, as fully and entirely as the same would have been held and enjoyed by me had this assignment and sale not been made.

In testimony whereof, I have hereunto set my hand and affixed my seal at Madison, in the County of Dane, and State of Wisconsin, this 18th day of February 1927.

[SEAL] HARRY STEENBOCK.

Witnesses:

(Illegible) BROWN,
L. W. HANKO.

STATE OF WISCONSIN,
County of Dane:

On this 21 day of February 1927, personally appeared before me, the above named HARRY STEENBOCK and acknowledged that he executed the above instrument as his free act, and deed for the purposes therein set forth.

[SEAL] R. J. TOEPFER,
Notary Public, Dane County, Wis.

My commission expires September 11, 1927.

RECORDED: Transfers of Patents, U. S. Patent Office, Feb. 26, 1927. Liber R129 Page 582.

THOMAS E. ROBERTSON,
Commissioner of Patents.

EXHIBIT E

COPIES OF LICENSE AGREEMENTS [1]

This Agreement made this First day of November, 1938, between the Wisconsin Alumni Research Foundation, a Wisconsin corporation not for private profit (hereinafter called "Licensor") and Pet Milk Company, a corporation of the State of Delaware, having its principal office and place of business at 1401 Arcade Building, St. Louis, Missouri (hereinafter called "Licensee")

WITNESSETH:

WHEREAS, the parties hereto entered into a certain license agreement under date of November 1, 1933, in respect to the following United States Letters Patents owned by the Licensor:

No. 1,680,818, issued August 14, 1928, upon the application of Harry Steenblock,

No. 1,871,135, issued August 9, 1932, upon the application of Harry Steenblock,

No. 1,871,136, issued August 9, 1932, upon the application of Harry Steenblock,

No. 2,057,399, issued October 13, 1936, upon the application of Harry Steenbock, and

WHEREAS, pursuant to said license agreement the Licensee was also granted a license under United States Letters Patent No. 1,817,936, issued August 11, 1931, upon the application of George Supplee, under which said patent the Licensor had authority to grant licenses; and,

WHEREAS, upon the date of said license agreement, licenses of identical terms were granted to the following companies: The Borden Company, Carnation Company, Indiana Condensed Milk Company, Nestle's Milk Products, Inc., and Pet Milk Company, hereinafter sometimes referred to as the Licensees and

WHEREAS, said license agreement of November 1, 1933, was modified and interpreted in certain respects by letter agreements between the parties hereto, dated February 28, 1934, and August 9, 1934, at which times said license agreements with the other Licensees were similarly modified and interpreted; and

WHEREAS the licenses granted by each of said license agreements extended for a period of five years from November 1, 1933, and at the expiration thereof each licensee had an option to continue its said license upon certain terms outlined in Section X of each of said license agreements; and

WHEREAS, the Licensee desires to exercise said option to renew its license under condition that said license agreement dated November 1, 1933, as modified by said letter agreements, be further modified in certain respects, which further modifications have been agreed to by the Licensor, and it is the desire of the Licensor and the Licensee to supersede said prior agreement and amending agreements by this new agreement which will incorporate herein all of said modifications and bring same down to date.

NOW, THEREFORE, for and in consideration of the premises and of the conditions and promises hereinafter contained, it is agreed by and between the parties hereto, as follows

[1] In the copies of license agreements hereinafter set forth royalty rates and percentages, dollar figures, prices, and certain other amounts and figures have been omitted.

Digitized by Google

I

The Licensor grants to the Licensee a license under United States Letters Patent No. 1,680,818, No. 1,871,136, No. 1,871,135, No. 1,817,936, No. 2,057,399, and any and all patents or patent applications relating to the irradiation of fluids or food products as may now or hereafter be filed by, assigned to, owned by, acquired by, or controlled by the Licensor to activate the Licensee's unsweetened evaporated milk and to sell the same.

The word "activate" as used herein means the enhancement of Vitamin D potency of the Licensee's unsweetened evaporated milk by the direct treatment of such milk by ultra violet rays either before, during, or after the evaporation step.

II

The rights granted to the Licensee under this license shall extend throughout the world, save for Great Britain (including North Ireland and the Isle of Man), and Germany.

The rights granted to the Licensee under this license and to the other Licensees under their respective licenses shall be exclusive to the Licensees in the United States, its territories and possessions, and nonexclusive throughout the remainder of the licensed territory, the Licensor hereby agreeing that so long as this agreement or any renewal thereof is in full force and effect that it shall not, except as hereinafter provided, license any person, company, or association whatsoever to irradiate unsweetened evaporated milk or to sell irradiated unsweetened evaporated milk in the exclusive territory covered hereby, except the Licensees, all of which companies were the original Licensees and the pioneers of irradiated evaporated milk.

III

The duration of this license unless otherwise terminated in accordance with the provisions of this contract, shall be for the period commencing November 1, 1938, and expiring August 14, 1945.

IV

For the rights secured under this license, the Licensee shall pay to the Licensor during the period specified in Section III hereof, royalties upon all unsweetened evaporated milk activated and sold under this license by it and by subsidiary and affiliated companies operating under Section XXXI hereof, in accordance with the following schedule:

cents per case on the first cases of activated evaporated milk sold hereunder, during each contract year.

cents per case on the next cases of activated evaporated milk sold hereunder, during each contract year.

cent per case on all activated evaporated milk sold hereunder in excess of cases, during each contract year.

The Licensee shall within thirty (30) days after the first of February, May, August, and November of each year during the existence of this license, commencing with February 1, 1939, remit to the Licensor the amount of royalties due the Licensor according to the above schedule for the immediately preceding three months' period.

It is specifically understood, however, that the Licensee shall not be required to pay royalty to the Licensor for its unsweetened evaporated milk activated under this license and sold in or sold for export to countries in which the Licensor does not now or hereafter own patents or possess licensing rights under patents corresponding to the United States Letters Patents specified in Section I hereof; or for activated unsweetened evaporated milk picked up and destroyed because of spoilage or any other reason making it unmarketable; or for activated unsweetened evaporated milk purchased from one of the other Licensees and upon which royalties have already been paid.

"Contract year" as used herein means each full twelve (12) months' period during the life of this agreement and any renewal thereof, commencing with November 1, 1938. In the event this license or any renewal thereof is terminated by expiration or by mutual consent prior to October 31 of any contract year, each of the basic amounts provided for in the schedule above shall be reduced in the same proportion that the number of months or portions of months which the license has then run since the expiration of the preceding contract year bears to twelve (12) and royalties for said portion of a contract year (paid or unpaid) shall be adjusted accordingly.

Digitized by Google

The Licensee shall at the time it makes the last royalty payment under this license or any renewal thereof, either add to or subtract from, as the case may be, the number of cases on which it is to pay royalties the number of cases comprising the difference between the inventory of activated unsweetened evaporated milk which the Licensee has on hand at the date of expiration or cancellation of this agreement or renewal thereof, as the case may be, and the inventory of activated unsweetened evaporated milk which the Licensee has on hand on October 31, 1938; it being the intention of the parties that if said October 31, 1938, inventory is less than said inventory as of the date of termination, the Licensee shall pay to the Licensor royalties on said difference; and if said October 31, 1938, inventory is greater than said inventory as of date of termination, the Licensee shall be credited with royalties on said difference.

A case of unsweetened evaporated milk as used in this license means a case containing forty-eight tall cans of net weight 14½ ounces each (provided, however, that in the event the industry should in general practice increase the contents of the can to sixteen (16) ounces, then forty-eight (48) such cans shall constitute a case), and all milk packed in cans smaller or larger than the current tall size (or sixteen- (16) ounce size, in the event of such change) shall be adjusted as to count of cases to the net milk content of such tall size can as may be currently in general use.

The Licensor guarantees that the terms and conditions provided for herein will always be as favorable as those granted to any licensee and that the royalties provided for in this section and the minimum guarantee provided for in Section V are as low as those paid or payable by any licensee now or hereafter licensed under any or all of the patents and patent applications referred to herein to activate unsweetened evaporated milk by the direct treatment of said milk with ultra violet rays, except that it is understood that the other Licensees now have different royalty schedules (the number of cases to be included in the _____ cent bracket and the _____ cent bracket mentioned above), and the Licensor agrees that it will not further modify the royalty schedule of any Licensee so as to render it any more favorable than it is today without modifying Licensee's royalty schedule proportionately and that it will give to the Licensee the benefit of any terms and conditions more favorable or any reduction in the rate of royalties and in equal terms to those which may have been given or may hereafter be given to any other licensee in the unsweetened evaporated milk field under any or all of said patents, and patent applications, it being the intent that the terms and conditions of this agreement and the royalties and the basic figures used in calculating the royalties and the minimum guarantee paid or payable by Licensee during the term of this license and any renewal thereof shall, except as hereinabove provided, always be as favorable and as low as Licensor's most favored licensee in the evaporated milk field, provided, however, that this provision shall not apply in the case of licenses granted pursuant to the second paragraph of Section XI hereof.

V

If in any contract year during the life hereof royalties paid by the Licensee to the Licensor are less than an amount equivalent to the sum based upon the schedule of royalties set forth in Section IV, hereof, applied to the total quantity of unsweetened evaporated milk sold during said contract year by the Licensee and by its subsidiary and affiliated companies operating under Section XXI of this license agreement in the United States, in containers of sixteen ounces (16 oz.) or less under brands owned by the Licensee and by its said subsidiary and affiliated companies operating under Section XXI hereof, less the total quantity of said evaporated milk (a) picked up and destroyed because of spoilage or for any other reason which in the opinion of Licensee makes it unmarketable; (b) sold in the United States for export; (c) sold where the sale or distribution of activated unsweetened evaporated milk is prohibited by any law, ordinance, or governmental regulation; (d) sold to the United States government or any division or department thereof where the orders or bids of the buyer specify unactivated evaporated milk; and (e) purchased from one of the licensees and upon which royalties have already been paid, then and in such event the Licensee shall pay to the Licensor such additional payment for said contract year as will bring its total payment for said year up to said amount.

VI

It is the understanding of the parties that no increase in the price of unsweetened evaporated milk shall be made by the Licensee by reason of the Vitamin D imparted to such milk under this licensee agreement. It is expressly understood,

Digitized by Google

however, that nothing in this paragraph shall be construed as in any way limiting the Licensee's legal rights to establish prices on its unsweetened evaporated milk.

VII

The parties hereto are not presently aware of any reason why this license should not endure noncancellable for the life of United States Letters Patent No. 1,680,818—that is, until August 14th, 1945, and it is the agreement and intent of the parties that it shall so endure. However, unforeseen contingencies may arise under which it would be unfair to the Licensee to require it to continue this license and which would in fairness impel the Licensor to release the Licensee from its obligations hereunder. This could and doubtless would be done by mutual action should such occasion arise, but to express now the intention of the parties as nearly as may be, it is agreed that if contrary to all present knowledge it should be found that the activation of unsweetened evaporated milk by ultra-violet rays under this license is substantially harmful to the user of such milk, or to the milk itself, the Licensee shall have the right to cancel this license.

Before the Licensee shall exercise such right of cancellation, the Licensee shall consult with the Licensor in respect thereto and in the event that disputes arise between the Licensor and the Licensee as to whether or not such unforeseen contingencies justify the Licensee in cancelling this license, the parties agree to settle each such dispute by arbitration, as hereinafter provided, and to abide by the award of the majority of the arbitrators.

In the event that such arbitration is required, the Board of Arbitrators shall consist of three members, one of which shall be appointed by the Licensor, one of which shall be appointed by the Licensee and the third member of which shall be appointed by the two thus selected. Such arbitration proceedings shall be strictly private between the Licensor and the Licensee. The arbitrators shall prescribe the procedure to be followed by the parties in presenting the matter for their consideration and the decision of the majority of the arbitrators shall be binding upon both parties. Each party shall be responsible for the compensation of the arbitrator appointed by it and the parties shall share equally the compensation of the third arbitrator. The other expenses of arbitration shall be paid by either party or both as the arbitrators may direct.

In addition to the foregoing right of cancellation, the Licensee may cancel this license without cause two years after the date hereof, or at any time thereafter up to August 13th, 1945, by serving upon the Licensor 90 days' written notice of its election so to do, provided, however, that in the event of such cancellation the Licensee shall pay to the Licensor within thirty days from the effective date of such cancellation, in addition to such other sums as are required to be paid by the Licensee to the Licensor under this agreement, an amount equal to the difference between the royalties paid and/or due from the Licensee to the Licensor from the date hereof to such date of cancellation, and cents per case of evaporated milk upon which said royalties have been paid and/or are due. If this license is renewed, as provided for herein, the Licensee may cancel this agreement at any time after August 14th, 1945, without payment of any consideration by serving upon the Licensor 90 days' written notice of the election so to do.

In the event that Letters Patent No. 1,680,818 be adjudicated to be invalid by any Circuit Court of Appeals of the United States, the Licensees shall not be obligated to pay royalty on unsweetened evaporated milk activated and sold in the territory subject to the jurisdiction of such court or courts; provided, however, that if said patent is later adjudicated valid by the Supreme Court of the United States, royalties for such territories will again be payable from the date of decision of such Circuit Court of Appeals.

VIII

It is understood that the Licensees, individually or collectively, will continue a general advertising campaign in the United States markets where the Licensee's unsweetened evaporated milk is sold, for the purpose of keeping before the public the value of Vitamin D as incorporated into unsweetened evaporated milk.

IX

The Licensee shall not sell unsweetened evaporated milk activated under this license except in cans of a capacity of sixteen ounces or less. This limitation shall not apply to unsweetened evaporated milk sold under this license outside of the United States.

Digitized by Google

The Licensee agrees that it will not knowingly directly or indirectly sell its unsweetened evaporated milk activated under this license to others for resale under brands not owned by the Licensee or by subsidiary or affiliated companies operating under Section XXI hereof (except to others licensed by the Licensor to activate unsweetened evaporated milk for sale under their own brands), or as a source of Vitamin D for any other product when such product is intended to be sold or resold on a commercial basis. In case it comes to the attention of the Licensee by notice or otherwise that its activated evaporated milk is being so used and/or sold by others, the Licensee will take all reasonable steps to prevent a continuance of such use and/or resale.

X

At the expiration of this license on August 14, 1945, the Licensee shall have the option to continue this license for the remainder of the lives of the patents and patent applications referred to herein (except United States Letters Patent No. 1,680,818, which will have expired upon the expiration of this license), upon the same terms and conditions as provided for herein, except a lower royalty basis may be agreed upon between the parties hereto.

XI

The Licensor shall have the right to grant additional licenses for the activation of unsweetened evaporated milk upon the same terms and conditions as this license, but only upon securing the approval of the Licensee. It is understood, however, that the Licensor shall have the right without the consent or approval of, but after consultation with the Licensees, to grant one license upon like terms and conditions as this license except that the royalties to be paid and the calculation of the minimum guarantee shall be based on a flat rate of _____ cents per case, in the place of and to replace the license of each Licensee which for any reason expires, lapses, or is terminated during the life of any of said patents.

In the event that the Licensor should at any time during the life of this license be compelled by virtue of or pursuant to the laws of the United States of America, to grant additional licenses under the patents herein licensed, of a similar scope to this license (not referring, however, to licenses granted to the other Licensees, or to additional licenses granted pursuant to the first paragraph of this section of this license), then and in such event the Licensee shall be credited pro rata with the amount of royalties received by the Licensor from any such additional license or licenses in each contract year during the life hereof, based upon the royalties paid in such contract year by the Licensee in proportion to the total royalties paid in such contract year by the Licensees.

XII

The Licensee agrees that while the Vitamin D content of unsweetened evaporated milk manufactured and sold under this license shall be high enough to aid materially in the general prevention of rickets in children, said evaporated milk shall not be intended or sold as a cure for rickets. The Licensee agrees that the Licensor may declare for the Licensee the number of units of Vitamin D to be imparted to each unit of product, and in the event that later clinical evidence should suggest the desirability of readjustment of potency, the Licensee furthermore agrees to make an increase or decrease in potency as recommended by the Licensor, such increase or decrease to go into effect within such reasonable time as may be agreed upon by the Licensee and Licensor.

The Licensor agrees that the Licensee will not be required under any circumstances to increase or decrease the potency of its activated unsweetened evaporated milk in such a way as to conflict with the provisions of any pertinent statute, ordinance, law or governmental regulation which may now or hereafter be in force and pertain to the subject.

XIII

The Licensee shall not, without the approval of the Licensor, circulate any advertising material naming the Steenbock process, the Steenbock patent, the University of Wisconsin, the Licensor, or Dr. Steenbock. No extravagant or unwarranted advertising claims shall be made by the Licensee for the unsweetened evaporated milk activated under this agreement and specifically attributed to Vitamin D. The Licensee shall furnish the Licensor with copies of representative advertisements of the product in connection with which representations are made as to the Vitamin D content if requested by Licensor.

Digitized by Google

It is understood that for the purpose of selecting suitable advertising material in accordance with the spirit of this section, the parties will confer with one another and advertising counsel before any general advertising program relating to Vitamin D is adopted.

XIV

The Licensee shall keep at its principal office true and particular account of all unsweetened evaporated milk activated and sold under this license agreement. At the request of the Licensor, upon reasonable notice, such records shall be available for check and audit by the Licensor or a certified public accountant in its behalf. Such records shall be preserved for at least three years. The Licensor shall regard information obtained from such records as confidential.

XV

The Licensee shall endeavor in good faith to comply with all statutory provisions pertaining to the marking of patented articles.

XVI

The Licensor does hereby grant to the Licensee the right and option at any time during the life of this agreement or any renewal thereof to affix in a suitable manner upon the label of each and every can in which it sells evaporated milk activated by ultra violet rays the following seal or insignia:

{Wisconsin Alumni Research Foundation
Approved for Vitamin D upon
periodic tests}

provided, however, that in the event the Vitamin D potency of the Licensee's product, according to tests made by or for the Licensor, should fall below standards established by the Licensor hereunder, which standards shall not be in conflict with any law, ordinance, or governmental regulation, the Licensee agrees that upon ninety (90) days' prior written notice from the Licensor it will promptly discontinue the use of such seal and not resume its use until it has complied with said standards.

It is further understood that the right to the use of the foregoing seal shall be exclusive to the Licensees in the field of unsweetened evaporated milk.

Upon the expiration of this license or any renewal thereof, as the case may be it is agreed that the Licensee shall have the right and option to continue the use of the aforesaid seal for a further period of five (5) years in consideration for which the Licensee shall pay a royalty of _____ cent per case on its activated unsweetened evaporated milk sold during said period in cans upon the labels of which appear said seal, the calculation of said royalties and the payment thereof to be made in the same manner as provided in the last four paragraphs of Section IV hereof, provided, however, that the Licensee continues at all times to meet the requirements relating to the use of said seal as provided above.

It is further understood that this right shall be exclusive to the Licensees in the field of unsweetened evaporated milk, if the right and option is exercised by at least three (3) of the Licensees and so long as the seal is being used by at least three (3) of the Licensees on not less than _____ percent of each of their total sales of activated unsweetened evaporated milk.

In the event the Licensee exercises the aforesaid option, the Licensor agrees to continue periodic Vitamin D testing of the Licensee's activated unsweetened evaporated milk so long during said five (5) year period as the Licensee continues to make royalty payments as herein provided for.

XVII

The Licensor shall have the right at any time to inspect and test samples of the Licensee's activated unsweetened evaporated milk and to this end the Licensee agrees to furnish the Licensor upon reasonable notice, such quantity of the unsweetened evaporated milk activated under this license agreement packed ready for sale, as may be reasonably necessary for the Licensor to test the potency thereof.

XVIII

The Licensor shall have the right to prosecute suits for infringement of the Letters Patent by virtue of which the Licensee is operating, and the Licensees, together with all other licensees under said patents shall be liable for one-half of

Digitized by Google

the reasonable costs of litigation involving infringements of the United States patents referred to herein.

The Licensor shall have the right, and it shall be its duty, to apportion equitably such one-half of the expenses of litigation among other licensees bound by their contracts to bear a portion of such expenses, but the Licensee herein shall not in any event be liable for more than its pro rata portion of such expenses, based on royalties currently accruing. It is understood that damages received by the Licensor in any suit will be applied against the cost of such suit before division of expenses between the licensees and Licensor as herein provided.

The Licensee shall have the right, at its own expense, to assist and cooperate with the Licensor in the prosecution of such litigation.

XIX

If the royalties or any part thereof, shall for a period of thirty (30) days be in arrears, or in the case of default by the Licensee in performing any of the agreements herein contained, the Licensor shall have in addition to all other legal or equitable remedies it may have in regard to the enforcement of this contract, the right to revoke this license if Licensee has not cured such default within a period of sixty (60) days after receipt of written notice setting forth said default or defaults.

If the default is in the payment of royalties, the Licensee shall, in addition to making payments of the royalties in arrears, pay interest at the rate of — per centum per annum upon said royalties from the due date thereof.

XX

The Licensor agrees that in all licenses granted by it for the activation of fluid milk by the use of irradiated ergosterol or by direct application of ultraviolet rays, it will incorporate a provision preventing the use of or sale of such activated milk by such licensees for the manufacture of activated unsweetened evaporated milk.

XXI

The Licensee shall have no right to assign this license without the approval of the Licensor. The benefits of this license may, however, be extended to—

(a) Subsidiary companies, 75% of whose stocks are owned by the Licensee, or by such a subsidiary of the Licensee.

(b) Companies, 75% of whose stock is owned by parent company referred to in (1).

ATTEST: (Signed) R. W. BALLMAN,
Asst. Secretary.

THIS SUPPLEMENTAL AGREEMENT made this Twenty-second day of May 1939, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation not for private profit (hereinafter called the "Licensor"), and PET MILK COMPANY, a corporation of the State of Delaware, having its principal office and place of business at 1401 Arcade Building, St. Louis, Missouri, (hereinafter called the "Licensee"),

WITNESSETH:

WHEREAS, the parties hereto entered into a certain license agreement under date of November 1, 1938, in respect to certain United States Letters Patents owned or controlled by the Licensor, which said agreement superseded a prior agreement between the parties hereto dated November 1, 1933; and

WHEREAS similar licenses were granted by the Licensor under date of November 1, 1938, to the following companies: The Borden Company, Indiana Condensed Milk Company, Nestle's Milk Products, Inc., and Carnation Company.

WHEREAS, said license agreement of November 1, 1938, embodied certain provisions respecting the right of the Licensee thereunder to use a certain seal or insignia adopted by the Licensor, both during the lives of the patents therein licensed and for a designated period after the expiration of said patents; and

Digitized by Google

WHEREAS, it is the desire of the parties hereto to modify in certain respects the provision of said license agreement of November 1, 1938, dealing with the use of said seal or insignia.

NOW, THEREFORE, for and in consideration of the promises and of the conditions and promises hereinafter contained, it is agreed by and between the parties hereto as follows:

I

That Section XVI of said license agreement of November 1, 1938, between the parties hereto is hereby amended to read as follows:

The Licensor does hereby grant to Licensee and all subsidiary and affiliated companies of Licensee operating under Section XXI hereof the right and option at any time during the life of this agreement or any renewal thereof without the payment of any fee or royalty to affix in a suitable manner upon the label of each and every can which it sells of evaporated milk activated by ultraviolet rays the following seal or insignia:

{Wisconsin Alumni Research Foundation Approved for Vitamin D upon periodic tests}

provided, however, that in the event the Vitamin D potency of the Licensee's product, according to tests made by or for the Licensor, should fall below standards established by the Licensor hereunder (which standards shall not be in conflict with any law, ordinance, or governmental regulation), the Licensee agrees that upon ninety (90) days' prior written notice from the Licensor it will promptly discontinue the use of such seal and not resume its use until it has complied with said standards.

It is further understood that the right to the use of the foregoing seal shall be exclusive to the Licensees and all subsidiary and affiliated companies of Licensees operating under Section XXI hereof in the field of unsweetened evaporated milk.

Upon the expiration date of this agreement and license or any renewal thereof, as the case mey be, it is agreed that the Licensee and all subsidiary and affiliated companies of Licensee operating under Section XXI hereof shall have the right and privilege if and when it complies with the Vitamin D potency requirements as provided for above, to use the aforesaid seal at any time and for such period or periods of time as it or any of them shall elect during the ten (10) year period immediately following such expiration date, and in consideration of such right and use the Licensee shall pay or cause to be paid to Licensor an amount equal to _____ cent per case on all unsweetened evaporated milk sold in the United States and Canada by it and by its subsidiary and affiliated companies operating under Section XXI hereof in cans upon the labels of which appears said seal up to but not to exceed in any "contract year" _____ Dollars.

The Licensee shall within thirty (30) days after the first three (3) months of the "contract year" and each three (3) months thereafter remit or cause to be remitted to the Licensor the amount if any then due to the Licensor on the basis of _____ cent per case as above provided for the immediately preceding three (3) months' period up to and until the payments have amounted to the maximum amount to be paid in any one "contract year," to-wit, _____ dollars.

"Contract year" as used herein means each full twelve (12)months' period during the ten (10) year life of the right granted hereunder commencing with the expiration date of this agreement and license or any renewal thereof as the case may be.

It is specifically understood, however, that in calculating the amount to be paid hereunder the unsweetened evaporated milk bearing said seal sold in the United States and Canada for export to countries other than the United States and Canada shall not be considered as milk sold and further that the Licensee shall be credited with an amount equal to _____ cent per case as defined on all evaporated milk bearing said seal picked up and destroyed because of the unmarketability of same.

It is further understood that this right shall be exclusive to the Licensees in the field of unsweetened evaporated milk, if the right and option is exercised by at least three (3) of the Licensees and so long as the seal is being used by at least (3) of the Licensees on not less than _____ percent of each of their total sales of activated unsweetened evaporated milk.

In the event the Licensee exercises the aforesaid right and privilege, the Licensor agrees to make periodic Vitamin D testing of the Licensee's activated unsweetened

Digitized by Google

evaporated milk during the period or periods within said ten (10) years that the Licensee is using said seal and is making the payments therefor as herein provided for.

Except as herein expressly provided, all of the terms, conditions, and provisions of said license agreement of November 1, 1938, between the parties hereto are and shall remain in full force and effect.

IN WITNESS WHEREOF, the parties hereto have by their respective duly authorized officers set their hands hereto and caused their respective corporate seals to be affixed the day and year first above written.

WISCONSIN ALUMNI RESEARCH FOUNDATION,

PET MILK COMPANY,
By (Signed) JOHN A. LATZER, *President.*

Attest:

[SEAL] (Signed) R. W. BALLMANN,
Asst. Secretary.

Plaintiff has issued licenses identical in terms to that of the Pet Milk Company to the following companies:

The Borden Company.
Carnation Company.
Indiana Condensed Milk Company.
Nestle's Milk Products, Inc.

The foregoing four license agreements have been modified in the same manner as the Pet Milk Company license has been modified.

THIS AGREEMENT, Made this 21st day of March 1929, between Wisconsin Alumni Research Foundation, a Wisconsin corporation not for pecuniary profit (hereinafter called Licensor), Harry Steenbock, of Madison, Wisconsin (hereinafter called Patentee), and Mead Johnson & Co., a corporation of the State of Indiana, with its principal place of business at Evansville, Indiana (hereinafter called Licensee):

Witnesseth, That,

Whereas, the Licensor is a corporation organized under Chapter 180, Wisconsin Statutes, to promote, encourage and aid scientific investigation and research at the Universtiy of Wisconsin by the faculty, staff, alumni, and students thereof, and those associated therewith, and to provide or assist in providing means and machinery by which their scientific discoveries, inventions, and processes may be developed and applied and patented, and the public, commercial and humanitarian uses thereof determined and utilized, and by which such utilization or disposition may be made of such discoveries, inventions or processes and patent rights or interest therein, as may tend to stimulate, promote and provide funds for further scientific investigation and research within said University or departments thereof; and,

Whereas, the Licensor is the owner of United States Letters Patent No. 1,680,818, issued August 14, 1928, upon the application of Harry Steenbock, upon antirachitic products and process, and is also the owner of certain inventions upon which applications for patents have been filed in the Patent Office of the United States by said Harry Steenbock, relating to antirachitic foods and/or medicines, and/or methods for producing the same, including those inventions described in the following applications for United States Letters Patent:

Steenbock Serial No. 157429, filed Dec. 27, 1926;
Steenbock Serial No. 157430, filed Dec. 27, 1926;
Steenbock Serial No. 185922, filed April 22, 1927;
Steenbock Serial No. 185923, filed April 22, 1927;

and

Whereas, Mead, Johnson & Company, Winthrop Chemical Company, Abbott Laboratories, Parke-Davis & Company and E. R. Squibb & Sons, hereinafter sometimes called the Licensees of this group, have negotiated with the Licensor, and now desire to secure licenses for the irradiation or activation and sale of ergosterol (meaning hereafter not only ergosterol, but also its derivatives and other steols and other derivatives capable of being activated or irradiated, or

Digitized by Google

other activateable materials that may be discovered and found usable in the pharmaceutical and medical fields as herein contemplated), activated and/or irradiated by the means and methods disclosed in said patent and/or patent applications, said ergosterol to be produced and sold for use in human medicine only. It is understood that when the word "ergosterol" is used in this license, it means activated or irradiated ergosterol, and that this license has nothing to do with nonactivated or nonirradiated ergosterol; and,

Whereas, the said companies likewise desire to be licensed by the Licensor for the purpose of increasing antirachitic potency of cod liver oil as hereinafter set forth; and,

Whereas, it is the mutual desire of the Licensor, of the Patentee and of the companies above named, that the licenses shall to each of said companies be of identical terms, and that the product or products sold by each of said companies shall be of the same standard of potency as regards the antirachitic principle or vitamin D content, all to the end that standardized products will be available to the pharmacists and to the medical profession, It is agreed:

1. The Licensor grants to the Licensee a license to use the inventions described in said patent and/or said patent applications for: (*a*) The manufacture and sale of activated or irradiated ergosterol for use in medicines and for pharmaceutical purposes only as above defined; (*b*) the right to use activated or irradiated ergosterol for the purpose of preparing solutions of vitamin D in medicinally neutral oils, so as to give them rickets-preventing potencies five (5) times as great as standard cod liver oil and/or one hundred (100) times as great a potency as standard cod liver oil; (*c*) the right to use activated or irradiated ergosterol for the purpose of preparing solutions of vitamin D with cod liver oil so as to give such cod liver oils rickets-preventing potencies equal to a standard cod liver oil and/or five (5) times as great as a standard cod liver oil; and (*d*) the right to sell the oils so treated.

The treated cod liver oils shall be initially of such vitamin D standard as defined in the appendix hereto, which standard may by mutual agreement of Licensees of this group be changed from time to time; said Licensees may also by mutual agreement change the factor five (5) and the factor one hundred (100) to some other number or numbers to define the vitamin D potency in relation to standard cod liver oil as expressed in rat units and described in the appendix hereto.

2. The parties hereto recognizing the necessity of maintaining a standard of potency, uniformity and ease of administration of activated ergosterol so that the use of activated ergosterol may be permanently established in good repute in human medicines, agree that for the present the manufacture and sale of activated ergosterol shall be limited to preparations in oil. It is recognized that the mode of compounding and administration may vary and may include such convenient forms as liquids, emulsions, elixirs, tablets, and troches, compounded of activated or irradiated ergosterol and some medicinally inert medium. It is also recognized that it may be compounded and administered in some medicinally potent medium other than cod liver oil thus producing a compound medicine possessing other primary virtues than those attributed to vitamins A and D. But before the Licensee may change to media other than oils as expressed in this article, it shall obtain the written consent of the Licensor to so do.

3. The Licensor and/or Patentee shall, without charge, give to the Licensee, its agents and servants, such assistance, data, explanation, and information bearing upon the processes as shall enable licensee to work the processes to the best advantage to the full extent known to the Patentee and/or Licensor. The Licensor and/or Patentee shall forthwith communicate to the Licensee, its agents and servants, any improvement and invention which they or either of them may make or acquire with respect to the processes, whether such improvement or further invention shall be patented or not, and will fully disclose to the Licensee the nature and manner of performing the same, and will apply for Letters Patent therefor if so requested by the Licensee and will permit the Licensee to use the same and to manufacture and sell under the same without payment of any further or additional royalty as specified hereinafter.

4. The said license for the manufacture and sale of activated or irradiated ergosterol for use in human medicine and/or for human pharmaceutical purposes only, in the form of an oil solution one hundred (100) times the potency of standard cod-liver oil and the use of activated or irradiated ergosterol for the purpose of producing cod-liver oil of standard potency, and the use of activated or irradiated ergosterol for the purpose of producing in a medicinally neutral oil and/or in cod-liver oil a preparation or preparations of five (5) times the vitamin D potency of standard cod-liver oil as defined in rat units, extends throughout the world

Digitized by Google

save for Great Britain (including North Ireland and the Isle of Man) and Germany. As to the rights granted by this license, except as to the enrichment of deficient cod-liver oil up to standard in vitamin D content, this Licensee, together with the other named Licensees of this group, shall have exclusive rights in the United States and the territory subject to the jurisdiction thereof, and in the remainder of the permitted territory such rights shall be nonexclusive.

5. The duration of this license shall be for that length of time measured by the United States Letters Patent No. 1,680,818, issued August 14, 1928, and hereinbefore referred to.

6. Upon the execution of this agreement, the Licensee shall pay to the Licensor, as earnest money, the sum of _____ Dollars, which shall be applied to the credit of the Licensee in payment of the royalties hereinafter specified as they become due.

7. The Licensee agrees to pay to the Licensor within thirty (30) days from the end of each three (3) calendar months' period while this license agreement is in effect, and beginning after sales hereunder have been authorized as provided in paragraph 21 hereof, a sum equivalent to ____ percent of the net sales of the preparation in neutral oil carrying one hundred (100) times the potency of standard cod-liver oil sold during the preceding three (3) calendar months, and to pay to the Licensor a sum equivalent to ____ percent of the net sales of cod-liver oil or neutral oil to which activated or irradiated ergosterol has been added in lesser concentration as sold during the preceding three (3) calendar months. For preparations of irradiated or activated ergosterol made and sold in media other than oils either as a simple source of vitamin D or in compound medicines, the Licensee agrees to pay the Licensor ____ percent of the net sales of such product when the antirachitic potency of the product gram for gram is less than five (5) times or equal to five (5) times the potency of standard cod liver oil, but if the antirachitic potency of such product is greater than five (5) times the potency of standard cod-liver oil, the Licensee agrees to pay ____percent of the net sales of such product. The Licensee guarantees that the sum paid for each of the first and second years after sales are authorized shall not be less than _____ dollars, and that the sum paid for the third year after sales are authorized, shall not be less than _____ dollars, and for each and every year thereafter during the life of this license shall not be less than _____ dollars. The Licensee agrees to pay to the Licensor on the termination of this license by the lapse of time or otherwise ____ percent of the net sales price (estimated upon the previous year's business) of the activated or irradiated ergosterol for medicinal and pharmaceutical purposes manufactured under this license, but not then sold, and ____ percent of the net sales price similarly estimated on cod liver-oil or neutral oil to which has been added activated or irradiated ergosterol but which cod-liver oil or neutral oil has not then been sold, said last mentioned sums to be paid within six months from the date of termination of this license.

The term "net sales," as used in this agreement, means the listed selling price, minus discounts to the trade, and makes allowances for returned goods.

8. The Licensee shall keep at its principal office or offices, true and particular account of all matters connected with the manufacture and sale of activated or irradiated ergosterol for medicinal and pharmaceutical purposes, and like account of all matters connected with the treatment and sale of cod liver oil and/or neutral oil with activated or irradiated ergosterol, and shall furnish to the Licensor, within the times limited in the preceding paragraph, a true and correct statement of the quantity of the products sold. At the request of the Licensor, upon reasonable notice, such records and accounts shall be open to inspection and audit by the Licensor or its agents. The records and accounts of the Licensee shall be preserved for at least two (2) years.

9. No advertising shall contain extravagant or unwarranted statements. The Licensee shall not in its advertising, without the approval of the Licensor, circulate any advertising material relating to the Steenbock process, the Steenbock patents, the University of Wisconsin, or the Licensor; and such advertising material shall first be submitted to the Licensor for its approval. The Licensee shall advertise the preparation in neutral oil and/or in other medicinally inert media carrying activated or irradiated ergosterol in concentration greater than five (5) times the potency of standard cod liver oil only in those publications which primarily serve the drug trade and/or the medical profession.

10. The Licensee shall properly comply with all statutory requirements pertaining to the marking of patented articles.

11. The Licensor shall have the right at any time to inspect and test samples of the Licensee's irradiated or activated ergosterol and the Licensee's product or

Digitized by Google

products, and to this end the Licensee agrees to furnish to the Licensor upon reasonable notice, such quantity of its activated or irradiated ergosterol and of its product or products as packed or bottled ready for sale, as may be necessary for the Licensor to test the potency thereof. The purpose of this provision is that the Licensor may determine for its benefit and for the benefit of the other Licensees named and contemplated herein, that the product or products of the Licensee comply with the standard herein set forth.

12. As to the territory in which the Licensees have exclusive rights, the Licensor shall have the right to establish fair and reasonable minimum net prices for the products covered by this license except for deficient cod liver oil brought up to standard by the addition of irradiated or activated ergosterol. And the Licensee shall observe and abide by the said prices so established. Such prices so established shall remain in effect indefinitely but may be changed by the Licensor not less than ninety (90) days after consultation with all the Licensees of this group. In accordance with the provisions of this paragraph 12, the Licensor establishes the following schedule of minimum prices:

(2) Five cubic centimeters neutral oil prepared to one hundred times the vitamin D potency of standard cod liver oil, $ ____ per dozen, with maximum discounts of __ % and __ % for cash to all classes of customers.

(b) Fifty cubic centimeters of the same material, $ ____ per dozen, with maximum discounts of __ % and __ % for cash to all classes of customers.

(c) Three ounce bottle of cod liver oil enriched to five times the vitamin D potency of standard cod liver oil, $____ per dozen, with maximum discounts of __% and __% for cash to all classes of customers.

(d) Sixteen ounce bottle of the same material, $____ per dozen, with maximum discounts of __% and __% for cash to all classes of customers.

(e) No free goods of any kind or any other inducements are to be offered, the effect or tendency of which would be to lower the minimum prices above established.

This Licensee and each of the Licensees agrees not to furnish free the products covered in this license except for clinical and research purposes only; and at the end of each month the Licensor is to be furnished a list of the names and addresses of those to whom such products are given during that month, together with the amounts of each product furnished.

13. As to the territory in which the Licensees have exclusive rights until and unless changed by the mutual understanding of a majority of the Licensees of this group the Licensee agrees that its preparation or preparations of activated or irradiated ergosterol in neutral oil giving such a preparation a potency of one hundred (100) times the potency of standard cod liver oil shall be marketed in containers five (5) cubic centimeters in capacity and/or in containers fifty (50) cubic centimeters in capacity; and that its preparations having a vitamin D potency of five (5) times that of standard cod liver oil shall be marketed in containers of three and/or sixteen fluid ounces.

14. The Licensor and/or Patentee agree that they will grant to no one in the exclusive territory covered by this license, the right to use said inventions for the purpose of preparing cod liver oil of a higher degree of potency than standard cod liver oil, insofar as such cod liver oil is for human consumption.

15. In case of infringement in the fields covered by this License of any of the Letters Patent under which by virtue of this license the Licensee is operating, in such case the Licensees of this group may jointly take the necessary proceedings effectually to protect the said patent or patents, and to that end may use the name of the Licensor. If the said Licensees shall take such proceedings, the entire reasonable cost thereof shall be equally divided between the Licensor, on the one hand, and the said Licensees of this group, on the other hand. In such case the Licensees shall advance all the costs of litigation and shall take one-half of the previous year's expense from the succeeding year or years' royalty. If all the Licensees of this group shall elect not to take such proceedings, then the said Licensees shall notify the Licensor, and the Licensor, at its option, may take such proceedings at its own expense. In the former case, if any profits, damages, or royalties are collected in a suit brought by said Licensees, the amount thereof, less the cost of litigation, shall be divided equally between the Licensor and the Licensees. In the event that two of the several Licensees of this group shall wish to sue an infringer, in such case said Licensees shall notify the Licensor, and if the Licensor is of the opinion that such suit should be brought, it shall notify the remaining Licensees, and in such event the said Licensees of this group and the Licensor shall bear equally all the costs of such suit, and if profits, damages, or royalties are collected in such suit, they shall be divided as above set forth.

Digitized by Google

However, in any initial suit which shall be begun to establish the validity of the United States Letters Patent No. 1,680,818, in such cases the Licensor shall bear only one-third (⅓) of the expense thereof to be deducted by all of the Licensees hereinafter mentioned in their respective proportions, as herein set forth from the succeeding year or years' royalty accruing from each to the Licensor, and all of the United States Licensees shall in respect to the other two-thirds (⅔) of said expense each bear its proportionate part, the portions of said expense to be determined by a fraction whose numerator shall be the royalty paid during the previous year by each Licensee, and whose denominator shall be the total royalties paid to the Licensor by all the Licensees under the United States Letters Patent No. 1,680,818. In the event that there shall be no previous year's royalties for use as a factor, as herein outlined, the royalty figures shall be the guaranteed minimum royalty under the contract of such license or licenses for the previous year, and in case there is no such previous year's minimum guaranty, then the figure to be taken is the minimum guaranty for the first year in which the same is provided.

From the time any suit shall be instituted, royalties in any reasonably sufficient amount shall be withheld and retained by the Licensee until the final determination of such suit, at which time any advances made or liabilities incurred by the Licensee, shall be chargeable against the royalties so withheld, and the balance, if any, shall be immediately paid over to the Licensor. The Licensor and/or Patentee agrees to furnish the Licensee with all evidence which either of them may have and which may be necessary for the prosecution of any such litigation, without charge to the Licensee. The Licensee shall, unless the Licensor otherwise agrees in writing, carry any suit to the court of last resort. Neither the Licensor nor Patentee shall be liable for the costs and expenses incurred by the Licensee in any suit, except to the extent that royalties shall be or become due to the Licensor.

16. If any royalties hereinbefore covenanted to be paid shall be in arrears and unpaid for a period of thirty (30) days after the same shall have become payable, or if the Licensee shall permit or allow to be permitted a breach of any of the covenants herein contained on its part to be performed and observed, and shall not remedy such breach within sixty (60) days after written notice is given to it by the Licensor requiring such remedy, or if the Licensee shall become insolvent or commit any act of bankruptcy, or if any order for the compulsory liquidation of the Licensee shall be made by any competent court, the Licensor shall be at liberty in any and every such case, by notice in writing to determine this license, and, thereupon the license hereby granted, and all rights of the Licensee hereunder, shall forthwith cease and terminate, but without prejudice to the remedy of the Licensor to sue for and recover any royalties then due, and without prejudice to the remedy of either party in respect of any breach of the covenants herein contained.

17. The Licensee shall not, during the existence of this license, dispute the Licensor's or the Patentee's patents, and the Licensees shall not assign this license, or any part of the same, without the written consent of the Licensor, the Patentee, and the Licensees under similar licenses, except that the Licensee without such consent may sell or assign this license in connection with the sale or assignment of substantially its entire business.

18. The Licensor and Patentee agree that the licenses granted to other Licensees in this group shall be of the same and identical terms as this license.

19. This license may be terminated at any time after three (3) years from the date sales are authorized hereunder by notice in writing addressed to the Licensor three (3) months before the expiration date named in said notice.

20. The name Winthrop Chemical Co., Inc., as used in this license shall be deemed to include those corporations associated or affiliated with Winthrop Chemical Co., Inc., or with which Winthrop Chemical Co., Inc., is associated or affiliated (except I. G. Farbenindustrie Aktiengesellschaft of Frankfort, Germany), or whose capital stock is directly or indirectly owned by Winthrop Chemical Co., Inc., or who directly or indirectly own the capital of Winthrop Chemical Co., Inc., that is, such corporation (except I. G. Farbenindustrie Aktiengesellschaft) shall constitute a unit.

21 The Licensee agrees that the product or products licensed to be made and sold under this license shall not be sold or offered for sale until each of the companies named herein is in receipt of a written notice sent simultaneously to each company by the Licensor and Patentee authorizing the sale and offering for sale the product or products beginning sixty (60) days from the date of said notices. This provision shall be construed to include prohibiting the sending or giving of

Digitized by Google

samples or the detailing of physicians, pediatricians, doctors, pathologists, and the like but not to include the giving of samples for experimental or clinical work or research, which is permitted.

22. With respect to products covered by this license, which have a greater vitamin D potency than five times that of standard cod liver oil, wherever the dosage shall appear upon the labels or in the literature, or advertisements, it shall conform to the dosage determined by the Licensor.

23. Wherever in this contract discretion is given the Licensor and Patentee, such discretion shall not be exercised arbitrarily, but reasonably and in cooperation with the Licensee companies.

MEAD JOHNSON & CO.,
PARKE, DAVIS & CO.,
E. R. SQUIBB & SONS,
WINTHROP CHEMICAL CO.

GENTLEMEN: Pursuant to action taken at the New York meeting between the pharmaceutical licensees and the foundation, under date of January 12, 1936, we are writing you this as a separate letter in regard to the matter of sharing litigation expenses, profits, and damages in infringement litigation on the Steenbock patents.

With respect to any litigation respecting the validity or infringement of the Steenbock patents now pending or hereafter to be brought, the Wisconsin Foundation shall pay one-half of the expenses of such litigation, and the pharmaceutical licensees, together with other licensees of the Wisconsin Foundation under the Steenbock patents who may be bound by their contracts to contribute, shall pay the other half of such expenses. It is understood that the portion of such expenses to be borne by the five pharmaceutical licensees shall be divided share and share alike, between them.

Any profits or damages collected in these proceedings shall be divided equally between the foundation on the one hand and the pharmaceutical licensees on the other hand, it being understood, however, that the foundation shall have to take into consideration the interests of its other licensees under the Steenbock patents who contribute to this litigation and request a share of the profits and damages, and, further, that the foundation reserves to itself the right, in the judgment of its counsel, to start a further suit or suits at its own expense for the recovery on its own behalf of lost royalties, if not included in the recovery of profits or damages above-mentioned.

The proposed Sperti process infringement suits will be conducted by the foundation through its counsel.

The above arrangement is to be substituted for and in lieu of the present provisions on this subject matter contained in section 15 of the license agreements under the Steenbock patents between the foundation and the pharmaceutical licensees, respectively.

Also, pursuant to request made at the meeting between the foundation and the pharmaceutical licensees of January 12, 1936, we are setting forth herein the names of other licensees of the foundation bound by their contracts to share in the expenses of the Sperti process litigation these are:

E. I. DuPont de Nemours Co., Wilmington, Del.
Wander Co., Chicago, Ill.
R. B. Davis Co, Hoboken, N. J.
Dry Milk Co., New York.
The Borden Co., New York.

SUPPLEMENTAL AGREEMENT

This Supplemental Agreement made this 15th day of October 1936 between Wisconsin Alumni Research Foundation, a Wisconsin corporation, not for pecuniary profit (hereinafter called Licensor); Harry Steenbock, of Madison, Wisconsin (hereinafter called Patentee); and Mead Johnson & Company, a corporation of the State of Indiana, with its principal place of business at Evansville, Ind. (hereinafter called licensee);

WITNESSETH: Whereas the parties hereto entered into a certain license agreement under date of March 21, 1929, in respect of United States Letters Patent No. 1,680,818, issued August 14, 1928, upon the application of Harry Steeenbock, and certain applications for United States patents filed by Harry Steenbock; and

Whereas said license agreement, pursuant to the terms thereof, was identical in terms to licenses simultaneously granted to Parke, Davis & Co., E. R. Squibb & Sons, Winthrop Chemical Co. and Abbott Laboratories; and

Whereas it is the mutual desire of the parties hereto and of the other Licensees herein above mentioned to modify in certain respects this license agreement and in the same respects to modify each of said other license agreements so that all five of said licenses may remain identical in terms, it is agreed:

That the first sentence of the third paragraph commencing with the word "Whereas" of said license agreement of March 21, 1929, is hereby amended to read as follows:

"Whereas, Mead, Johnson & Company, Winthrop Chemical Company, Abbott Laboratories, Parke, Davis & Co. and E. R. Squibb & Sons, hereinafter sometimes called the Licensees of this group, have negotiated with the Licensor, and now desire to secure license for the irradiation or activation and sale of ergosterol (meaning hereafter, except where expressly otherwise limited, not only ergosterol, but also its derivatives and other sterols and other derivatives capable of being activated or irradiated, or other activatable materials that may be discovered and found usable in the pharmaceutical and medical fields as herein contemplated), activated and/or irradiated by the means and methods disclosed in said patent and/or patent applications, said ergosterol to be produced and sold for use in human medicine, and/or (as hereinafter limited) for administration to dogs, cats and foxes." [Handwritten:] Not pet mice? Or monkeys?

II

That section I of said license agreement of March 21, 1929, is hereby amended by adding thereto immediately following the end of the first paragraph thereof, the following paragraph:

"It is understood and agreed that the Licensee may sell activated or irradiated ergosterol (meaning for the purpose of the right granted in this sentence only, activated or irradiated ergosterol as such and not derivatives thereof or other sterols), in solutions of medicinally neutral oils, having rickets-preventing potencies of 10,000 U. S. P. S. 1934 Revised Vitamin D units per gram and/or such activated or irradiated ergosterol with halibut liver oil, such combined product having rickets-preventing potencies of 10,000 U. S. P. X. 1934 Revised Vitamin D units per gram, for administering the same directly and as such to dogs, cats and foxes."

Digitized by Google

III

That section 4 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"IV. The said license for the manufacture and sale of activated or irradiated ergosterol for use in human medicine and/or for human pharmaceutical purposes only, in the form of an oil solution containing a potency of 10,000 U. S. P. X. 1934 Revised Vitamin D units per gram and the use of activated or irradiated ergosterol for the purpose of producing cod liver oil of standard potency, and the use of activated or irradiated ergosterol for the purpose of producing in a medicinally neutral oil and/or in cod liver oil a preparation or preparations containing 400 U. S. P. X. 1934 Revised Vitamin D units per gram, and the said license for the manufacture and sale of activated or irradiated ergosterol (as hereinabove limited), and/or such activated or irradiated ergosterol with halibut liver oil, for administration to dogs, cats, and foxes only, extend throughout the world save for Great Britain (including North Ireland and the Isle of Man) and Germany. As to the rights granted by this license, except as to the enrichment of deficient cod liver oil up to standard in Vitamin D content and except as to the sale of activated or irradiated ergosterol (as hereinabove limited) and/or such activated or irradiated ergosterol with halibut liver oil, for administration to dogs, cats, and foxes, this license, together with the other named Licensees of this group, shall have exclusive rights in the United States and the territory subject to the jurisdiction thereof, and in the remainder of the permitted territory such rights shall be nonexclusive."

IV

That section 9 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"9. No advertising shall contain extravagant or unwarranted statements. The Licensee shall not in its advertising, without the approval of the Licensor, circulate any advertising material relating to the Steenbock process, the Steenbock patents, the University of Wisconsin, or the Licensor; and such advertising material shall be first submitted to the Licensor for its approval. Advertisement by the Licensee of the preparation in neutral oil and/or in other medicinally inert media carrying activated or irradiated ergosterol in concentration greater than 400 U. S. P. X. 1934 Revised Vitamin D units per gram shall be limited to those publications which primarily serve the drug trade and/or the medical profession; provided, however, that activated or irradiated ergosterol (as hereinabove limited) and/or such activated or irradiated ergosterol with halibut liver oil, for administration to dogs, cats, and foxes may be advertised in publications serving the veterinary profession and/or the public."

V

Wherever in said license agreement of March 21, 1929, the potency of any product is described as one hundred (100) times the potency of standard cod liver oil as defined in the appendix thereto, such description is hereby modified to read "10,000 U. S. P. X. 1934 Revised Vitamin D units per gram," and wherever in said license agreement the potency of any product is described as five (5) times the potency of standard cod liver oil as defined in the appendix thereto, such description is hereby modified to read "400 U. S. P. X. 1934 Revised Vitamin D units per gram."

VI

Except as herein expressly modified, all of the terms, conditions, and provisions of said license agreement of March 21, 1929, between the parties hereto, shall be and remain in full force and effect.

IN WITNESS WHEREOF the parties hereto have duly executed this instrument the day and year first above written.

SUPPLEMENTAL AGREEMENT

This Supplemental Agreement made this 3rd day of June 1937 between Wisconsin Alumni Research Foundation, a Wisconsin Corporation not for private profit (hereinafter called Licensor), Harry Steenbock of Madison, Wisconsin (hereinafter called Patentee), and Mead Johnson & Company, a corporation of the State of Indiana, with its principal place of business at Evansville, Indiana (hereinafter called the Licensee),

WITNESSETH:

Whereas the parties hereto entered into a certain license agreement under date of March 21, 1929, in respect of United States Letters Patent No. 1,680,818, issued August 14, 1928, upon the application of Harry Steenbock, and certain applications for United States Patents filed by Harry Steenbock, upon which said applications the following United States Letters Patent have issued upon the following dates respectively:

Patent No. 1,871,135, issued August 9, 1932,
Patent No. 1,871,136, issued August 9, 1932,
Patent No. 2,057,399, issued October 13, 1936, and

Whereas said license agreement, pursuant to the terms thereof, was identical in all respects to licenses simultaneously granted to Abbott Laboratories; Parke, Davis & Company; E. R. Squibb & Sons; Winthrop Chemical Company; and

Whereas said license agreement and the license agreements with said other companies above mentioned (which said companies, together with the Licensee, are hereinafter sometimes designated as the "Licensees of this group," said phrase meaning the present Licensees under said patents) were, by Supplemental Agreements between the Licensor and each of the Licensees thereunder, entered into October 15, 1936, modified each in the same respects; and

Whereas, since the execution of said license agreements of March 21, 1929, sources of Vitamin D and methods of producing the same, different from the methods of the patents herein licensed, have been discovered and made available with the result that there are now upon the market in the territory covered by said agreements additional Vitamin D pharmaceutical preparations sold in competition with products sold by the Licensees of this group under said licenses; and

Whereas the Licensor desires to stimulate and encourage the efforts of the Licensee and other Licensees of this group to increase the sale of products sold under said licenses by reducing in certain respects the royalty rates provided for in said license agreements of March 21, 1929; and

Whereas it is the opinion of the Licensor and the Licensees of this group that economic conditions in the territory covered by said license agreements, particularly in the United States of America, are such that the manufacturing and distributing costs of products made and sold under said licenses are likely to increase substantially in the immediate future; and

Whereas in order to stimulate further and encourage the efforts of the Licensees of this group to increase the sale of products sold under said licenses, and in view of the probable general rise in costs of raw material and labor hereinabove referred to, the Licensor intends to state as minimum net sales prices for "Viosterol," Vitamin D in propylene glycol sold by Winthrop under the trade-mark "Drisdol" and cod-liver oil with "Viosterol" for a period of three years commencing January 1, 1937, the present minimum net sales prices of said products now in effect; and

Whereas, since the execution of said license agreements of March 21, 1929, the Licensor and the Licensees of this group have jointly commenced an action for infringement of certain of the patents herein licensed against General Development Laboratories, Inc., a Delaware corporation, in the United States District Court for the Eastern District of New York, said cause being entitled "*Wisconsin Alumni Research Foundation et al.* v. *General Development Laboratories, Inc.*, Equity No. 7871," and which said cause is now pending; and

Whereas it is the mutual desire of the Licensor and of the Licensees of this group that the Licensor shall be empowered to grant not to exceed two additional licenses under the patents herein licensed to certain concerns hereinafter named (hereinafter sometimes referred to as "additional Licensees") if the granting of such licenses shall be necessary to enable the Licensor to compromise said litigation above referred to; and

Whereas it is the mutual desire of the Licensor and the Licensees of this group that said additional licenses shall be upon terms and conditions not more favorable to the Licensees thereunder than the licenses heretofore granted to the Licensees of this group (except the Winthrop Chemical Company) are to such Licensees of

Digitized by Google

this group (except the Winthrop Chemical Company), as heretofore and as herein amended, save with respect to minimum annual guaranteed royalty payments hereinafter provided for; and

Whereas it is further the mutual desire of the Licensor and the Licensees of this group to modify in certain other respects this license agreement and in the same respects to modify each of said other license agreements with the Licensees of this group, so that all of said licenses may remain identical in terms, except that the license to the Winthrop Chemical Company shall not be identical in terms with said other license agreements in certain respects as hereinafter set forth: Now, therefore, it is agreed—

I

The last paragraph of Section 1 of said license agreement of March 21, 1929, is hereby amended to read as follows:

The treated cod liver oils shall be of a potency of 85 U. S. P. XI Vitamin D units per gram and/or of a potency of 400 U. S. P. XI Vitamin D units per gram, which standards may by mutual agreement of the Licensor and not less than all of the Licensees of this group and of such companies as may hereafter become Licensees of the Licensor, pursuant to this agreement, except one, be changed from time to time; the Licensor, and not less than all of the Licensees of this group and said additional licensees except one, may also by mutual agreement change the potency of 10,000 U. S. P. XI Vitamin D units per gram herein established to some other potency or potencies.

II

Section 4 of said license agreement of March 21, 1929, as amended by said Supplemental Agreement of October 15, 1936, is hereby further amended to read as follows:

IV. The said license for the manufacture and sale of activated or irradiated ergosterol for use in human medicine and/or for human pharmaceutical purposes only, in the form of an oil solution containing a potency of 10,000 U. S. P. XI Vitamin D units per gram and the use of activated or irradiated ergosterol for the purpose of producing cod liver oil of a potency of 85 U. S. P. XI Vitamin D units per gram, and the use of activated or irradiated ergosterol for the purpose of producing in a medicinally neutral oil and/or in cod liver oil a preparation or preparations containing 400 U. S. P. XI Vitamin D units per gram, and the said license for the manufacture and sale of activated or irradiated ergosterol (as hereinabove limited), and/or such activated or irradiated ergosterol with halibut liver oil, for administration to dogs, cats, and foxes only, extend throughout the world save for Great Britain (including North Ireland, and the Isle of Man) and Germany. As to the rights granted by this license, except as to the enrichment of deficient cod liver oil up to 85 U. S. P. XI Vitamin D units per gram and except as to the sale of activated or irradiated ergosterol (as hereinabove limited) and/or such activated or irradiated ergosterol with halibut liver oil for administration to dogs, cats, and foxes, this Licensee, together with the other named Licensees of this group, shall have exclusive rights in the United States and the territory subject to the jurisdiction thereof, and in the remainder of the permitted territory such rights shall be nonexclusive; provided, however, that the Licensor may, subject to the following restrictions, grant two additional licenses under the patents herein licensed, one of said licenses to the William S. Merrell Company, Cincinnati, Ohio, and the other of said licenses either to the Frederick Stearns & Company, Detroit, Michigan, or the E. L. Patch Company, Boston, Massachusetts. Such additional licenses shall be granted by the Licensor only if the granting thereof is, in the opinion of the Licensor, necessary to effectuate a compromise of the pending litigation between the Licensor and Licensees of this group, as plaintiffs, and General Development Laboratories, Inc., a Delaware corporation, as defendant, now pending in the United States District Court for the Eastern District of New York and entitled *Wisconsin Alumni Research Foundation, et al,* vs. *General Development Laboratories, Inc.*, Equity No. 7871". Any such additional licenses shall be upon terms and conditions not more favorable to the licensees thereunder than the licenses to the Licensees of this group (except the Winthrop Chemical Company) are to the Licensees of this group (except the Winthrop Chemical Company), except that there need not be incorporated therein provisions for any minimum annual guaranteed royalty payments corresponding to such minimum annual guaranteed royalty payments as are provided for in Section 7 of this license and of the licenses heretofore granted to the Licensees of this group, as amended herein.

Digitized by Google

It is understood and agreed that such additional Licensees shall be prohibited, by appropriate restrictions in any license agreements that may be entered into between the Licensor and such additional Licensees, from employing the process described and claimed in United States Letters Patent No. 1,676,579 to George Sperti and from advertising the use of said process in connection with products sold under said license agreements; provided, however, that in the event the Licensor makes available to the Licensees of this group licenses under said Sperti patent from the owner thereof, at no additional royalty to that specified in this agreement, then and in such event none of the Licensees, including the said additional licensees, shall be so prohibited from employing the process of said Sperti patent or from advertising the same in connection with products sold under such license agreements.

III

Section 7 of said license agreement of March 21, 1929, is hereby amended to read as follows:

7. The Licensee agrees to pay to the Licensor within thirty (30) days from the end of each three (3) calendar months' period while this license agreement is in effect, and beginning as of January 1st, 1937, a sum equivalent to _____ percent of the net sales of the preparations in neutral oil of a potency of 10,000 U. S. P. XI Vitamin D units per gram sold during the preceding three (3) calendar months, and to pay to the Licensor a sum equivalent to _____ percent of the net sales of cod liver oil or neutral oil to which activated or irradiated ergosterol has been added in lesser concentration as sold during the preceding three (3) calendar months. For preparations of irradiated or activated ergosterol made and sold in media other than oils either as a simple source of Vitamin D or in compound medicines, the Licensee agrees to pay the Licensor _____ percent of the net sales of such product when the antirachitic potency of the product gram for gram is less than or equal to 400 U. S. P. XI Vitamin D units per gram, but if the antirachitic potency of such product is more than 400 U. S. P. XI Vitamin D units per gram the Licensee agrees to pay _____ percent of an amount equal to the net sales price currently in effect of the irradiated ergosterol added to said product, sold as Viosterol, or, by Winthrop, under its trade-mark "Drisdol." The Licensee guarantees that the sum paid for each year while this license agreement is in effect shall be not less than _____ dollars. The Licensee agrees to pay to the Licensor on the termination of this license by the lapse of time or otherwise, _____ percent of the net sales price of the activated or irradiated ergosterol for medicinal and pharmaceutical purposes manufactured under this license, but not then sold, and _____ percent of the net sales price on cod liver oil or neutral oil to which has been added activated or irradiated ergosterol, but which cod liver oil or neutral oil has not then been sold, said last-mentioned sums to be paid within six (6) months from the date of termination of this license.

The term "net sales" as used in this agreement, means that amount computed upon the listed selling price f. o. b. place of manufacture minus all discounts to the trade, and makes allowances for returned goods.

It is understood and agreed that with respect to the Winthrop Chemical Company the royalty rates payable by it shall be respectively ____ percent wherever ____ percent is referred to in this section of this agreement and ____ percent wherever ____ percent is referred to in this section of this agreement, and the minimum guaranteed annual royalty payments payable by it shall be not less than _____ Dollars, such higher royalty rates and higher minimum guaranteed annual royalty payments to be in effect with respect to said Winthrop Chemical Company unless and until said Winthrop Chemical Company exercises its option referred to under Section 19 of this agreement, as amended herein.

The Licensee agrees to continue, while this license agreement is in effect, the use of irradiated ergosterol manufactured under this license agreement in all products sold by it in the United States under the following names or designations, in an amount not less than the average percentage of U. S. P. XI Vitamin D units of irradiated ergosterol which was used in said products respectively during the year 1936:

Cod liver oil with "Viosterol."
Halibut Liver Oil with "Viosterol" (both fluid and capsules).
"Haliver" Oil with "Viosterol" (both fluid and capsules, and "Viosterol".

Digitized by Google

IV

Section 12 of said license agreement of March 21, 1929, is hereby amended by deleting therefrom the following language:

"In accordance with the provisions of this paragraph 12, the Licensor establishes the following schedule of minimum prices:

(a) Five cubic centimeters neutral oil prepared to one hundred times the vitamin D potency of standard cod liver oil, per dozen, with maximum discounts of % and % for cash to all classes of customers.

(b) Fifty cubic centimeters of the same material, per dozen, with maximum discounts of % and % for cash to all classes of customers.

(c) Three-ounce bottle of cod liver oil enriched to five times the vitamin D potency of standard cod liver oil, per dozen, with maximum discounts of % and % for cash to all classes of customers.

(d) Sixteen-ounce bottle of the same material, per dozen, with maximum discounts of % and % for cash to all classes of customers.

(e) No free goods of any kind or any other inducements are to be offered the effect or tendency of which would be to lower the minimum prices above established,"

and by adding thereto, at the end thereof, the following:

"Pursuant to the powers conferred upon the Licensor by this section of this agreement, and in accordance with the provisions of this section, the minimum net sales prices of products licensed hereunder shall, commencing with January 1, 1937, and continuing to and including December 31, 1939, be as follows:

	List Price	Minimum to Retailer	Minimum to Wholesaler
5 cubic centimeters of activated or irradiated ergosterol in neutral oil or propylene glycol of a potency of 10,000 U. S. P. XI Vitamin D units per gram, per dozen			
20 cubic centimeters of activated or irradiated ergosterol in neutral oil or propylene glycol of a potency of 10,000 U. S. P. XI Vitamin D units per gram, per dozen			
50 cubic centimeters of activated or irradiated ergosterol in neutral oil or propylene glycol of a potency of 10,000 U. S. P. XI Vitamin D units per gram, per dozen			
3 ounces cod liver oil with activated or irradiated ergosterol, per dozen			
16 ounces cod liver oil with activated or irradiated ergosterol, per dozen			
Maximum discount %	X		

No free goods of any kind or any other inducements are to be offered, the effect or tendency of which would be to lower the minimum prices above established.

V

Section 13 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"13. As to the territory in which the Licensees have exclusive rights until and unless changed by the mutual understanding of a majority of the Licensees of this group, and of such companies as may hereafter become Licensees of the Licensor hereunder, the Licensee agrees that its preparation or preparations of activated or irradiated ergosterol in neutral oil giving such a preparation a potency of 10,000 U. S. P. XI Vitamin D units per gram shall be marketed in containers five (5) cubic centimeters in capacity, in containers twenty (20) cubic centimeters in capacity and/or in containers fifty (50) cubic centimeters in capacity~~; and/or in container~~ and that its preparations having a vitamin D potency of 400 U. S. P. XI Vitamin D units per gram shall be marketed in containers of three and/or sixteen fluid ounces."

VI

Section 14 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"14. The Licensor and/or Patentee agree that they will grant to no one in the exclusive territory covered by this license, the right to use said inventions for the

Digitized by Google

purpose of preparing cod liver oil of a higher degree of potency than 85 U. S. P. XI Vitamin D units per gram, insofar as such cod liver oil is for human consumption, except as hereinbefore specifically provided in Section 4 hereof, as amended herein, and except as hereinafter provided in Section X of this Supplemental Agreement."

VII

Section 18 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"18. The Licensor and Patentee agree that the licenses granted to other Licensees in this group and to additional Licensees, pursuant to the terms of Section 4 hereof, as herein amended, shall be of the same and identical terms as this license except as provided in Section 4 hereof, as herein amended, with respect to additional licenses that may hereafter be granted and except as to the Winthrop Chemical Company, as provided in Sections 7 and 19 hereof, as herein amended."

VIII

Section 19 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"19. This license may be terminated at any time after three (3) years from January 1st, 1937, by notice in writing addressed to the Licensor three (3) months before the expiration date named in said notice.

"The Winthrop Chemical Company, Inc., shall have the additional right to terminate its license at any time by notice in writing addressed to the Licensor three (3) months before the expiration date named in said notice.

"The Winthrop Chemical Company shall have the option at any time within three (3) years from January 1, 1937, to waive its said right of cancellation during said three (3) year period by notifying the Licensor in writing of its election to waive such right of cancellation during such three (3) year period, in which event the provisions herein made applicable to the other Licensees of this group shall become applicable to Winthrop Chemical Company, Inc. also."

IX

Section V of said Supplemental Agreement of October 15, 1936, is hereby amended to read as follows:

"V. Wherever in said license agreement of March 21, 1929, the potency of any product is described as equal to standard cod-liver oil, such description is hereby modified to read '85 U. S. P. XI Vitamin D units per gram'. Wherever in said license agreement the potency of any product is described as one hundred (100) times the potency of standard cod liver oil (as defined in the appendix thereto), such description is hereby modified to read '10,000 U. S. P. XI Vitamin D units per gram'. Wherever in said license agreement the potency of any product is described as five (5) times the potency of standard cod-liver oil as defined in the appendix thereto, such description is hereby modified to read '400 U. S. P. XI Vitamin D units per gram'.

X

In the event that any of the Licensees of this group should terminate its agreement pursuant to the terms of Section 19 of said license agreement of March 21, 1929, as herein amended, the Licensor shall have the right to grant a license under the patents herein licensed upon the same terms and conditions of said license agreements of March 21, 1929, to the Licensees of this group (except the Winthrop Chemical Company), as herein amended, to any person, firm or corporation not disapproved by two of the remainder of the present group of five (5) Licensees.

XI

Except as herein expressly modified, all of the terms, conditions and provisions of said license agreement of March 21, 1929, between the parties hereto, as amended by said Supplemental Agreement of October 15, 1936, between the parties hereto shall be and remain in full force and effect.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By GEO. I. HAIGHT, *President.*

Attest:

L. M. HANKS, *Secretary.*
MEAD JOHNSON & COMPANY,
By L. D. JOHNSON, *President.*

Attest:

O. MCCUTCHEON, *Secretary.*
HARRY STEENBOCK, *Patentee.*

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis., March 20, 1939.

Mr. L. D. JOHNSON,
President, Mead Johnson & Co.,
Evansville, Ind.

DEAR MR. JOHNSON: In the past the foundation has on frequent occasions discussed with its licensees the matter of making more widespread the use of various forms of irradiated vitamin D in new and existing products of the licensees. More recently discussions have been had with reference to an attempt to accomplish this result by the establishment of a new royalty rate, upon a per million vitamin D unit basis, upon products not now containing irradiated vitamin D.

In line with these discussions, the foundation is now offering its pharmaceutical licensees a new proposal with the hope that all of them will see fit to adopt it extensively. It is agreeable to the foundation, commencing May 1, 1939, and continuing thereafter during the lives of the licensed patents, that royalties upon products of the licensees containing vitamin D combined with another ingredient or ingredients (other than the vitamin D carrier), but not containing any form of irradiated vitamin D at the date of this writing, shall be at the rate of 7 cents per million U. S. P. units of irradiated vitamin D of whatever form hereafter contained therein. In calculating royalties upon such products, the labeled number of vitamin D units or the actual number of irradiated vitamin D units used in the products, whichever amount is lower, shall be used as a base for such computation.

Products covered hereby shall include:

(*a*) Present products of the licensees now upon the market in which a source of vitamin D other than some form of irradiated vitamin D is used in combination with some other ingredient or ingredients (other than the vitamin D carrier), and in which the licensees replace, in whole or in part, such other source of vitamin D with irradiated vitamin D of any form.

(*b*) Products of the licensees not now upon the market but which may hereafter be introduced by the licensees and which contain any form of irradiated vitamin D combined with some other ingredient or ingredients (other than the vitamin D carrier).

Royalties shall be due and payable when products embraced within the scope of this letter are sold by the licensees and not when manufactured.

Royalties upon present licensed products of each of the licensees (a list of your company's products is attached hereto) shall be in no way affected by the proposal contained in this letter and shall continue as heretofore.

It is the intent of the foundation that the proposal contained in this letter shall embrace all forms of irradiated vitamin D, including irradiated ergosterol, delsterol, irradiated dry yeast, irradiated 7-dehydrocholesterol, and all other forms of irradiated vitamin D produced by any licensee under the Steenbock patents that may now or hereafter become available to the licensees.

The foundation requests that it be advised by the licensees of the products in which irradiated vitamin D is hereafter used by them pursuant to this proposal, including the names of such products, the dates upon which the licensees offer such products for sale and the form and amount of irradiated vitamin D used therein.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
H. L. RUSSELL, *Director.*

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis., April 27, 1939.

Mr. L. D. JOHNSON,
President, Mead Johnson & Co.,
Evansville, Ind.

DEAR MR. JOHNSON: Under date of March 20, 1939, the foundation wrote to each of the licensees announcing a new royalty program, effective May 1, 1939, with reference to certain products. With respect to the products covered by that letter, the royalty rate was then set at — per million U. S. P. units of irradiated vitamin D.

The foundation has given further consideration to this matter and is of the belief that if this royalty rate is reduced to a — per million rate, a much broader use of irradiated products will result. Therefore, this letter is the foundation's formal notification to its pharmaceutical licensees modifying the previous letter of March 20, 1939, by reducing the royalty rate referred to therein to a royalty rate of — per million, U. S. P. units of irradiated vitamin D.

With the exception of this point the other conditions and provisions of the letter of March 20, 1939, will be and continue in effect.

The foundation requests that it be advised by the licensees of the products in which irradiated vitamin D is hereafter used by them pursuant to this modification of our former proposal, including the names of such products, the dates upon which the licensees offer such products for sale and the form and amount of irradiated vitamin D used therein.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
H. L. RUSSELL, *Director.*

Plaintiff issued licenses identical in terms to that of Mead Johnson & Company to the following companies:

Abbott Laboratories,
Parke, Davis & Company,
E. R. Squibb & Sons,
Winthrop Chemical Company, Inc.

The foregoing four license agreements have been modified in the same manner as the Mead Johnson & Company license agreement has been modified, except for variations contained in the Supplemental Agreement of May 31st, 1937, with the Winthrop Chemical Company, Inc., hereinafter set forth.

SUPPLEMENTAL AGREEMENT

This Supplemental Agreement made this 31st day of May 1937, between Wisconsin Alumni Research Foundation, a Wisconsin corporation not for private profit (hereinafter called Licensor), Harry Steenbock of Madison, Wisconsin (hereinafter called Patentee), and Winthrop Chemical Company, Inc., a corporation of the State of New York with its principal place of business at New York City, New York:

WITNESSETH:

Whereas, the parties hereto entered into a certain license agreement under date of March 21, 1929, in respect of United States Letter Patent No. 1,680,818, issued August 14th, 1928, upon the application of Harry Steenbock, and certain applications for United States Patents filed by Harry Steenbock, upon which said applications the following United States Letters Patents have issued upon the following dates respectively:

Patent No. 1,871,135, issued August 9, 1932,
Patent No. 1,871,136, issued August 9, 1932,
Patent No. 2,057,399, issued October 13, 1936, and

Whereas, said license agreement, pursuant to the terms thereof, was identical in all respects to licenses simultaneously granted to Abbott Laboratories, Mead Johnson & Company, Parke, Davis & Company, and E. R. Squibb & Sons, and

Whereas, said license agreement and the license agreements with said other companies above mentioned (which said companies, together with the Licensee, are hereinafter sometimes designated as the "Licensees of this group," said phrase

Digitized by Google

meaning the present licensees under said patents) were, by Supplemental Agreements between the Licensor and each of the Licensees thereunder, entered into October 15, 1936, modified each in the same respects, and

Whereas, since the execution of said license agreements of March 21, 1929, sources of Vitamin D and methods of producing the same, different from the methods of the patents herein licensed, have been discovered and made available with the result that there are now upon the market in the territory covered by said agreements additional Vitamin D pharmaceutical preparations sold in competition with products sold by the Licensees of this group under said licenses, and

Whereas, the Licensor desires to stimulate and encourage the efforts of the Licensee and other Licensees of this group to increase the sale of products sold under said licenses by reducing in certain respects the royalty rates provided for in said license agreements of March 21, 1929, and

Whereas, it is the opinion of the Licensor and the Licensees of this group that economic conditions in the territory covered by said license agreements, particularly in the United States of America, are such that the manufacturing and distributing costs of products made and sold under said licenses are likely to increase substantially in the immediate future, and

Whereas, in order to stimulate further and encourage the efforts of the Licensees of this group to increase the sale of products sold under said licenses and in view of the probable general rise in costs of raw material and labor hereinabove referred to, the Licensor intends to state as minimum net sales prices for "Viosterol," Vitamin D in propylene glycol sold by the Licensee under the trade-mark "Drisdol" and cod liver oil with "Viosterol" for a period of three years commencing January 1, 1937, the present minimum net sales prices of said products now in effect, and

Whereas, since the execution of said license agreements of March 21, 1929, the Licensor and the Licensees of this group have jointly commenced an action for infringement of certain of the patents herein licensed against General Development Laboratories, Inc., a Delaware corporation, in the United States District Court for the Eastern District of New York, said cause being entitled "*Wisconsin Alumni Research Foundation et al.* v. *General Development Laboratories, Inc.*, Equity No. 7871," and which said cause is now pending, and

Whereas, it is the mutual desire of the Licensor and of the Licensees of this group that the Licensor shall be empowered to grant not to exceed two additional licenses under the patents herein licensed to certain concerns hereinafter named (hereinafter sometimes referred to as "additional Licensees") if the granting of such licenses shall be necessary to enable the Licensor to compromise said litigation above referred to, and

Whereas, it is the mutual desire of the Licensor and the Licensees of this group that said additional licenses shall be upon terms and conditions not more favorable to the Licensees hereunder than the licenses heretofore granted to the Licensees of this group, (except the Licensee) are to such Licensees of this group (except the Licensee), as heretofore and as herein amended, save with respect to minimum annual guaranteed royalty payments hereinafter provided for, and

Whereas, it is further the mutual desire of the Licensor and the Licensees of this group to modify in certain other respects this license agreement and to modify each of said other license agreements with the Licensees of this group, so that all of said licenses may remain identical in terms, except that the license to the Licensee shall not be identical in terms with said other license agreements in certain respects as hereinafter set forth. Now, therefore, it is agreed:

I

The last paragraph of Section 1 of said license agreement of March 21, 1929, is hereby amended to read as follows:

The treated cod liver oils shall be of a potency of 85 U. S. P. XI Vitamin D units per gram and/or of a potency of 400 U. S. P. XI Vitamin D units per gram, which standards may by mutual agreement of the Licensor and not less than all of the Licensees of this group and of such companies as may hereafter become Licensees of the Licensor, pursuant to this agreement, except one, be changed from time to time; the Licensor, and not less than all of the Licensees of this group and said additional licensees except one, may also by mutual agreement change the potency of 10,000 U. S. P. XI Vitamin D units per gram herein established to some other potency or potencies.

Digitized by Google

II

Section 4 of said license agreement of March 21, 1929, as amended by said Supplemental Agreement of October 15, 1936, is hereby further amended to read as follows:

IV. The said license for the manufacture and sale of activated or irradiated ergosterol for use in human medicine and/or for human pharmaceutical purposes only, in the form of an oil solution containing a potency of 10,000 U. S. P. XI Vitamin D units per gram and the use of activated or irradiated ergosterol for the purpose of producing cod liver oil of a potency of 85 U. S. P. XI Vitamin D units per gram, and the use of activated or irradiated ergosterol for the purpose of producing in a medicinally neutral oil and/or in cod liver oil a preparation or preparations containing 400 U. S. P. XI Vitamin D units per gram, and the said license for the manufacture and sale of activated or irradiated ergosterol (as hereinabove limited), and/or such activated or irradiated ergosterol with halibut llver oil, for administration to dogs, cats, and foxes only, extend throughout the world save for Great Britain (including North Ireland, and the Isle of Man) and Germany. As to the rights granted by this license, except as to the enrichment of deficient cod liver oil up to 85 U. S. P. XI Vitamin D units per gram and except as to the sale of activated or irradiated ergosterol (as hereinabove limited) and/or such activated or irradiated ergosterol with halibut liver oil, for administration to dogs, cats, and foxes, this Licensee, together with the other named Licensees of this group, shall have exclusive rights in the United States and the territory subject to the jurisdiction thereof, and in the remainder of the permitted territory such rights shall be nonexclusive; provided, however, that the Licensor may, subject to the following restrictions, grant two additional licenses under the patents herein licensed, one of said licenses to the William S. Merrell Company, Cincinnati, Ohio, and the other of said licenses either to the Frederick Stearns & Company, Detroit, Michigan, or the E. L. Patch Company, Boston, Massachusetts. Such additional licenses shall be granted by the Licensor only if the granting thereof is, in the opinion of the Licensor, necessary to effectuate a compromise of the pending litigation between the Licensor and Licensees of this group, as plainteffs, and General Development Laboratories, Inc., a Delaware corporation, as defendant, now pending in the United States District Court for the Eastern District of New York and entitled "*Wisconsin Alumni Research Foundation et al.* v. *General Development Laboratories, Inc.* Equity No. 7871." Any such additional licenses shall be upon terms and conditions not more favorable to the licensees thereunder than the licenses to the Licensees of this group (except the Licensee) are to the Licnesees of this group (except the Licensee), except that there need not be incorporated therein provisions for any minimum annual guaranteed royalty payments corresponding to such minimum annual guaranteed royalty payments as are provided for in Section 7 of this license and of the licenses heretofore granted to the Licensees of this group, as amended herein.

It is understood and agreed that such additional Licensees shall be prohibited, by appropriate restrictions in any license agreements that may be entered into between the Licensor and such additional Licensees, from employing the process described and claimed in United States Letters Patent No. 1,676,579, to George Sperti and from advertising the use of said process in connection with products sold under said license agreements; provided however, that in the event the Licensor makes available to the Licensees of this group licenses under said Sperti patent from the owner thereof, at no additional royalty to that specified in this agreement, then and in such event none of the licensees, including the said additional licensees, shall be so prohibited from employing the process of said Sperti patent or from advertising the same in connection with products sold under such license agreements.

III

Section 7 of said license agreement of March 21, 1929, is hereby amended to read as follows:

7. The Licensee agrees to pay to the Licensor within thirty (30) days from the end of each three (3) calendar months period while this license agreement is in effect, and beginning as of January 1st, 1937, a sum equivalent to % of the net sales of the preparations in neutral oil of a potency of 10,000 U. S. P. XI Vitamin D units per gram sold during the preceding three (3) calendar months, and to pay to the Licensor a sum equivalent to % of the net sales of cod liver oil or neutral oil to which activated or irradiated ergosterol has been added in lesser concentration as sold during the preceding three (3) calendar months. For preparations of irradiated or activated ergosterol made and sold in media

Digitized by Google

other than oils either as a simple source of Vitamin D or in compound medicines, the Licensee agrees to pay the Licensor % of the net sales of such product when the antirachitic potency of the product gram for gram is less than or equal to 400 U. S. P. XI Vitamin D units per gram, but if the antirachitic potency of such product is more than 400 U. S. P. XI Vitamin D units per gram, the Licensee agrees to pay % of an amount equal to the net sales price currently in effect of the irradiated ergosterol added to said product, sold as Viosterol, or by the Licensee, under its trade-mark "Drisdol." The Licensee guarantees that the sum paid for each year while this license agreement is in effect shall be not less than Dollars. The Licensee agrees to pay to the Licensor on the termination of this license by the lapse of time or otherwise % of the net sales price of the activated or irradiated ergosterol for medicinal and pharmaceutical purposes manufactured under this license, but not then sold, and % of the net sales price on cod liver oil or neutral oil to which has been added activated or irradiated ergosterol, but which cod liver oil or neutral oil has not then been sold, said last mentioned sums to be paid within six (6) months from the date of termination of this license.

The term "net sales" as used in this agreement, means that amount computed upon the listed selling price f. o. b. place of manufacture minus all discounts to the trade, and makes allowances for returned goods.

It is understood and agreed that in the event the Licensee exercises its option referred to under Section 19 of this agreement, as amended herein, commencing with the date said option is exercised and continuing thereafter during the life of this agreement the royalty rates payable by the Licensee shall be the same as the royalty rates applicable, commencing with January 1, 1937, to the other Licensees of this group, to wit: percent wherever percent is referred to in this section of this agreement and percent wherever percent is referred to in this section of this agreement, and the minimum guaranteed annual royalty payments payable by it shall be not less than Dollars.

The Licensee agrees to continue, while this license agreement is in effect, the use of irradiated ergosterol manufactured under this license agreement in all products sold by it in the United States under the following names or designations, in an amount not less than the average percentage of U. S. P. XI Vitamin D units of irradiated ergosterol which was used in said products respectively during the year 1936:

Cod liver oil with "Viosterol",
Halibut Liver Oil with "Viosterol",
(both fluid and capsules)
"Haliver" Oil with "Viosterol",
(both fluid and capsules), and
"Viosterol".

IV

Section 12 of said license agreement of March 21, 1929, is hereby amended by deleting therefrom the following language:

"In accordance with the provisions of this paragraph 12, the Licensor establishes the following schedule of minimum prices:

"(a) Five cubic centimeters neutral oil prepared to one hundred times the vitamin D potency of standard cod liver oil, $---------- per dozen, with maximum discounts of --% and --% for cash to all classes of customers.

"(b) Fifty cubic centimeters of the same material, $---------- per dozen, with maximum discounts of --% and --% for cash to all classes of customers.

"(c) Three ounce bottle of cod liver oil enriched to five times the vitamin D potency of standard cod liver oil, $---------- per dozen, with maximum discounts of --% and --% for cash to all classes of customers.

"(d) Sixteen ounce bottle of the same material, $---------- per dozen, with maximum discounts of --% and --% for cash to all classes of customers.

"(e) No free goods of any kind or any other inducements are to be offered, the effect or tendency of which would be to lower the minimum prices above established",

and by adding thereto, at the end thereof, the following:

Pursuant to the powers conferred upon the Licensor by this section of this agreement, and in accordance with the provisions of this section, the minimum net sales prices of products licensed hereunder shall, commencing with January 1, 1937, and continuing to and including December 31, 1939, be as follows:

Digitized by Google

	List Price	Minimum to Retailer	Minimum to Wholesaler
5 cubic centimeters of activated or irradiated ergosterol in neutral oil or propylene glycol of a potency of 10,000 U. S. P. XI Vitamin D units per gram, per dozen			
20 cubic centimeters of activated or irradiated ergosterol in neutral oil or propylene glycol of a potency of 10,000 U. S. P. XI Vitamin D units per gram, per dozen			
50 cubic centimeters of activated or irradiated ergosterol in neutral oil or propylene glycol of a potency of 10,000 U. S. P. XI Vitamin D units per gram, per dozen			
3 ounces cod-liver oil with activated or irradiated ergosterol, per dozen			
16 ounces cod-liver oil with activated or irradiated ergosterol, per dozen			
Maximum discount, percent			

No free goods of any kind or any other inducements are to be offered, the effect or tendency of which would be to lower the minimum prices above established.

V

Section 13 of said license agreement of March 21 1929, is hereby amended to read as follows:

"13. As to the territory in which the Licensees have exclusive rights until and unless changed by the mutual understanding of a majority of the Licensees of this group, and of such companies as may hereafter become Licensees of the Licensor hereunder, the Licensee agrees that its preparation or preparations of activated or irradiated ergosterol in neutral oil giving such a preparation a potency of 10,000 U. S. P. XI Vitamin D units per gram shall be marketed in containers five (5) cubic centimeters in capacity, in containers twenty (20) cubic centimeters in capacity and/or in containers fifty (50) cubic centimeters in capacity; and that its preparations having a vitamin D potency of 400 U. S. P. XI Vitamin D units per gram shall be marketed in containers of three and/or sixteen fluid ounces."

VI

Section 14 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"14. The Licensor and/or Patentee agree that they will grant to no one in the exclusive territory covered by this license, the right to use said inventions for the purpose of preparing cod liver oil of a higher degree of potency than 85 U. S. P. XI Vitamin D units per gram, insofar as such cod liver oil is for human consumption, except as hereinbefore specifically provided in Section 4 hereof, as amended herein, and except as hereinafter provided in Section X of this Supplemental Agreement."

VII

Section 18 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"18. The Licensor and Patentee agree that the licenses granted to other Licensees in this group and to additional Licensees, pursuant to the terms of Section 4 hereof, as herein amended, shall be of the same and identical terms as this license except as provided in Section 4 hereof, as herein amended, with respect to additional licenses that may hereafter be granted and except as to the Licensee, as provided in Sections 7 and 19 hereof, as herein amended."

VIII

Section 19 of said license agreement of March 21, 1929, is hereby amended to read as follows:

"19. This license may be terminated at any time after three (3) years from January 1st, 1937, by notice in writing addressed to the Licensor three (3) months before the expiration date named in said notice.

"The Licensee shall have the additional right to terminate this license at any time by notice in writing addressed to the Licensor three (3) months before the expiration date named in said notice. The Licensee shall have the option at any time within three (3) years from January 1, 1937, to waive its said right of cancellation during said three (3) year period by notifying the Licensor in writing of

Digitized by Google

its election to waive such right of cancellation during such three (3) year period, in which event the provisions herein made applicable to the other Licensees of this group shall become applicable to the Licensee also."

IX

Section V of said Supplemental Agreement of October 15, 1936, is hereby amended to read as follows:

V. Wherever in said license agreement of March 21, 1929, the potency of any product is described as equal to standard cod liver oil, such description is hereby modified to read "85 U. S. P. XI Vitamin D units per gram." Wherever in said license agreement the potency of any product is described as one hundred (100) times the potency of standard cod liver oil (as defined in the appendix thereto), such description is hereby modified to read "10,000 U. S. P. XI Vitamin D units per gram." Wherever in said license agreement the potency of any product is described as five (5) times the potency of standard cod liver oil as defined in the appendix thereto, such description is hereby modified to read "400 U. S. P. XI Vitamin D units per gram."

X

In the event that any of the Licensees of this group should terminate its agreement pursuant to the terms of Section 19 of said license agreement of March 21, 1929, as herein amended, the Licensor shall have the right to grant a license under the patents herein licensed upon the same terms and conditions of said license agreements of March 21, 1929, to the Licensees of this group (except the Licensee), as herein amended, to any person, firm or corporation not disapproved by two of the remainder of the present group of five (5) Licensees.

XI

Except as herein expressly modified, all of the terms, conditions, and provisions of said license agreement of March 21, 1929, between the parties hereto, as amended by said Supplemental Agreement of October 15, 1936, between the parties hereto shall be and remain in full force and effect.

In witness whereof the parties hereto have duly executed this instrument the day and year first above written.

WISCONSIN ALUMNI RESEARCH FOUNDATION,

(Signed) L. D. BARNEY, *Witness.*

THIS AGREEMENT made this 15th day of November 1935 between WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation not for pecuniary profit, hereinafter called "FOUNDATION", and E. I. DU PONT DE NEMOURS AND COMPANY, a corporation of Delaware, having its principal office and place of business at Wilmington, Delaware, hereinafter called "DU PONT".

WITNESSETH:

Whereas the FOUNDATION is the owner of United States Letters Patent No. 1,680,818, issued August 14, 1928, upon the application of Harry Steenbock, upon Antirachitic Products and Processes; and is the owner of certain other patents relating to the subject matter of said patent, namely, United States Letters Patent No. 1,871,135 and No. 1,871,136 and may now have or hereafter acquire other inventions and patents pertaining thereto; and

Whereas Harry Steenbock of Madison, Wisconsin, has heretofore assigned to the FOUNDATION all future improvements that may be made and/or acquired by him upon the inventions described in the foregoing patents; and

Whereas, Winthrop Chemical Company and I. G. Farbenindustrie Aktiengesellschaft have agreed with the FOUNDATION not to sue any present or future Licensee of the FOUNDATION in any country (except Germany) for infringement of

Digitized by Google

any patent on activated or irradiated ergosterol and its derivatives which may or has issued on the applications for patents of Dr. Windaus or his assignee pending on November 10, 1928; and

Whereas, under date of November 15, 1929, the FOUNDATION, said Harry Steenbock, and Acetol Products, Inc., a Delaware corporation, entered into a certain license agreement with respect to the foregoing subject matter, which said agreement was thereafter amended by certain supplemental agreements between the parties thereto; and

Whereas said agreement of November 15, 1929, as thereafter amended, was assigned by the licensee, Acetol Products, Inc., to DU PONT on or about April 30, 1935, which said assignment was consented to by the FOUNDATION and Harry Steenbock; and

Whereas, DU PONT has formulated plans for and is now engaging in a program of research both fundamental and applied, in relation to the products herein licensed and other related problems; and

Whereas, the parties hereto are desirous of canceling said agreement of November 15, 1929, as amended by said supplemental agreements, and substituting therefor the agreement to be hereinafter fully set forth.

Now, therefore, in consideration of the covenants hereinafter set forth and mutually acquiesced in by the parties hereto it is agreed by and between said parties as follows:

1. The previously described agreement of November 15, 1929, as subsequently amended, shall be considered as canceled, in accordance with the terms hereof, on and after November 15, 1935. All obligations and rights accruing under or arising from said agreement shall be irrevocably terminated on November 15, 1935, unless hereinafter otherwise specifically provided for.

2. (A) The FOUNDATION grants to DU PONT a license to practice the invention disclosed and/or claimed in the aforesaid patents and/or any improvements thereon and/or additional patents now or hereafter owned or acquired by the FOUNDATION, for the manufacture and sale of activated or irradiated ergosterol or its derivatives, and/or cholesterol or its derivatives, and/or other sterols or their derivatives, said ergosterol or its derivatives, and/or cholesterol or its derivatives, and/or other sterols or their derivatives to be prepared from molds and/or other fungi and/or any other plant tissues of any kind whatsoever (excluding yeast) and/or from animal sources; provided, however, that such products may be sold by DU PONT only to other licensees of the FOUNDATION, licensed to purchase or use such products, except as hereinafter otherwise provided for. It is understood that if the aforesaid activatable materials may be produced synthetically such synthetic products are embraced within the present agreement.

(b) The FOUNDATION also grants to DU PONT a license to sell the activated or irradiated products described in Section 2 (A) hereof for use in stock, poultry and/or animal feeds, such feeds not to be used for human consumption, and to have a minimum Vitamin D potency per unit that will be sufficient to aid in the prevention of rachitic conditions in domesticated animals, including poultry. In case of misuse of the activated or irradiated products, sold under this Section 2 (b), for other purposes than for incorporation in poultry, stock and animal feeds or in case of misuse of said feeds for purposes other than those for which said feeds are customarily used, and upon notification to DU PONT by the FOUNDATION of such misuse, DU PONT agrees in good faith within a reasonable period of time to use its best endeavors to restrain such misuse.

Sales of the activated or irradiated products under this Section 2 (b) for use in stock, poultry and/or animal feeds shall not be restricted to sales to other licensees of the FOUNDATION.

(C) The FOUNDATION, also grants to DU PONT, commencing as of January 1, 1936, a license to sell the activated or irradiated products described in Section 2 (a) hereof for incorporation in bread and/or breadstuffs by commercial bakers. The term "breadstuffs" as used in this license includes rolls, buns, and biscuits (excluding crackers) and the like according to their ordinary significance to the trade in the United States.

Sales of the activated or irradiated products under this Section 2 (C) for incorporation in bread and/or breadstuffs by commercial bakers shall not be restricted to sales to other licensees of the FOUNDATION.

DU PONT agrees that sales by it of products pursuant to the license defined in this Section 2 (C) shall be made only to purchasers who have entered into written purchase contracts with DU PONT relating to said products. In addition to such provisions (not inconsistent with the provisions hereinafter set forth), as DU PONT

Digitized by Google

may in its discretion incorporate therein, such purchase contracts shall contain provisions similar to the following:

(a) A provision requiring the purchaser to use such activated or irradiated products only in such manner and in such proportions as DU PONT shall specify in such purchase contract.

(b) A provision prohibiting the purchaser from making extravagant or unwarranted statements in advertising with respect to the vitamin D content of products manufactured by such purchaser in which the herein licensed irradiated or activated products are incorporated, and requiring the purchaser to secure the approval of the FOUNDATION of all advertising material relating to such products in which the name of the Steenbock process, Dr. Steenbock, the University of Wisconsin, or the FOUNDATION is used.

(c) A provision providing for delivery to the purchaser by DU PONT of the activated or irradiated products purchased from DU PONT under such purchase contract in installments as nearly as practicable as needed by the purchaser.

(d) A provision requiring the purchaser properly to comply with all statutory requirements regarding the marking of articles offered by him for sale and covered by patents licensed hereunder to DU PONT.

(e) A provision granting to the purchaser an implied license, under patents herein licensed, to use the quantities of said irradiated or activated products purchased from DU PONT under said purchase contract, for incorporation in bread and/or breadstuffs, such implied license to continue only so long as such purchaser complies with all of the terms of said purchase contract.

The form and substance of the aforementioned provisions of such purchase contracts; namely, subparagraphs (a) to (e) inclusive, shall be subject to approval by the FOUNDATION prior to the execution of said contracts.

DU PONT shall make a bioassay (or cause to be made a bioassay at a laboratory suitable to the FOUNDATION) at intervals of not more than four months, of a sample of the product of each and every commercial baking plant which may use irradiated or activated products purchased from DU PONT under the license granted in this Section 2 (C) for incorporation in bread and/or breadstuffs and shall send a report of the results of each such bioassay to the FOUNDATION. In the event that the bioassays of the product of any baking plant show that the vitamin D potency of such product is below that contemplated by said purchase contract, then DU PONT shall (without being liable therefor) use its best efforts to cause such baking plant to modify its practice in order that its product shall thereafter have the vitamin D potency contemplated by its purchase contract.

DU PONT agrees that, in the event any purchaser of irradiated or activated products sold under this Section 2 (C), does not comply with the aforementioned provisions, subparagraphs (a) to (e), inclusive, of its purchase contract, DU PONT will, within four months after receiving written notice from the FOUNDATION setting forth in what particulars such purchaser has failed to comply with said provisions, promptly cancel its purchase contract with said purchaser, unless within such four months period said purchaser has corrected his practices so as to comply substantially with the conditions of said provisions.

In the sale of irradiated or activated ergosterol or its derivatives under the license granted in this Section 2 (C), DU PONT shall not sell said irradiated or activated ergosterol or its derivatives at a higher price than————or at a lower price than per million U. S. P. X. (Revised 1934) vitamin D units. In determining such minimum price, the charge for the bioassays heretofore referred to shall be included therein and the charge for diluents and containers for such diluents shall be excluded therefrom. In determining such maximum price, the charge for the bioassays heretofore referred to and the charge for diluents and containers for such diluents shall not be included therein.

(D) DU PONT is given the right to import the antirachitic substances licensed to it hereunder, in the event that DU PONT should deem such importation necessary for the proper and efficient conduct of its business hereunder; provided, however, that such antirachitic substances shall be of the type licensed hereunder to DU PONT, and in the event that such substances are purchased in foreign countries wherein such substances or processes relating to the production thereof have been patented to the FOUNDATION or its duly authorized agents, they shall be purchased from licensees or from parties who do not infringe such patent or patents granted to the FOUNDATION or its duly authorized agents in such countries.

Digitized by Google

3. Sales by DU PONT, under Sections 2 (a) and 2 (B) of the present agreement, may be made throughout the world save for Great Britain (including North Ireland and the Isle of Man) and Germany. Sales by DU PONT under Section 2 (C) of the present agreement may be made throughout the world save for Great Britain (including North Ireland and the Isle of Man), Canada, and Germany.

4. The rights granted under Section 2 (A) of this license shall be exclusive in the United States and the territory subject to the jurisdiction thereof, so long as DU PONT can supply the activated or irradiated products described therein in amounts sufficient to meet the regular reasonable demands therefor and upon customary trade terms. In the event that DU PONT shall be unable to supply the demand in the United States for any of said products, then after due notice from the FOUNDATION and after six months' time from the date of such notice, the FOUNDATION shall have the right to grant an additional but nonexclusive license to a third party to produce activated or irradiated material of the kind for which DU PONT failed to meet the aforementioned demand, provided that DU PONT shall not within such six months' period be able to meet such demand. The grant of the aforesaid nonexclusive license shall not affect DU PONT'S exclusive license for the production of activated or irradiated material of the other types licensed hereunder. Insofar as activated or irradiated cholesterol is concerned, it is understood that the aforementioned right of the FOUNDATION to grant a nonexclusive license therefor to a third party shall not become effective until October 1, 1940. Further, after October 1, 1940, if DU PONT'S inability to meet the demand for activated or irradiated cholesterol is due to the insufficiency of the supply of cholesterol available to DU PONT in the United States or the inability of DU PONT to find an outlet for the sale of unactivated cholesterol recovered in the process of irradiation or activation of said cholesterol, such inability shall not give rise to any right in the FOUNDATION to grant the nonexclusive license aforementioned with respect to activated or irradiated cholesterol.

In the remainder of the permitted territory, the rights granted under Section 2 (A) of this agreement shall be nonexclusive.

The rights granted under Sections 2 (B) and 2 (C) of this agreement shall be exclusive in the United States and the territory subject to the jurisdiction thereof and shall be nonexclusive for the remainder of the territory permitted by Section 3 of this agreement.

Except for the license expiring December 31, 1935, heretofore granted by the FOUNDATION to National Foods, Limited, and sublicenses granted thereunder. the FOUNDATION represents that it has not directly or indirectly granted, and agrees, that it will not hereafter directly or indirectly grant, so long as this agreement remains in force and effect, to any person, firm, or corporation other than DU PONT any right to use any irradiated or activated product covered by a patent or patents licensed hereunder (whether or not such product is licensed hereunder to DU PONT), for incorporation in bread and/or breadstuffs in the United States by commercial bakers, or for incorporation in ingredients to be used by commercial bakers in bread and/or breadstuffs in the United States (except the implied licenses to purchasers of activated or irradiated products from DU PONT, referred to in Section 2C (e) hereof) or any right to sell any such activated or irradiated product for such uses.

5. The licenses herein granted shall continue for a period of five years, until November 15, 1940. DU PONT shall have the option to renew the present agreement on the terms and conditions hereof for a further period beginning November 15, 1940, and ending with the termination of the patent last to expire of the several patents licensed hereunder and issuing on an application filed prior to August 9, 1949. The aforementioned option may be exercised by DU PONT by forwarding a written notice to the FOUNDATION of such intention on or before August 15, 1940.

6. DU PONT shall pay, as royalies to the FOUNDATION, within thirty days after the end of each calendar quarter while this license is in effect, sums equivalent to the following:

(*a*) -- percent of the net sales of the activated or irradiated products sold by DU PONT anywhere in the world under the license granted to it in Section 2 (C) hereof.

(*b*) -- percent of the net sales of the activated or irradiated products sold by DU PONT anywhere in the world under the license granted to it in Section 2 (a) hereof for use by licensees of the FOUNDATION in activating or fortifying buttermilk for human consumption.

Digitized by Google

(c) -- percent of the net sales of the activated or irradiated products sold by DU PONT anywhere in the world under the license granted to it under section 2 (A) hereof, to licensees of the FOUNDATION for use as or in human medicine.

(d) -- percent of the net sales of activated or irradiated products sold by DU PONT anywhere in the world under the licenses granted to it under Sections 2 (A) and 2(B) hereof, except the sales covered by subparagraphs (a), (b), and (c) of this section of this agreement. The term "net sales" as used above in this agreement means the listed selling price F. O. B. place of manufacture, minus discounts to the trade, allowances for all returned goods, the charge for diluents and diluent containers, but not minus, in the case of sales made under the license granted in Section 2 (C) hereof, the charge for bioassays included in the price.

If in any year ending June 30th, beginning with the year ending June 30, 1937, the total royalties paid by DU PONT to the FOUNDATION under all the licenses herein granted to DU PONT, do not equal or exceed the sum of dollars, the licenses herein granted to DU PONT under Sections 2 (A) and 2 (B) hereof, but only insofar as they relate to the manufacture and sale of irradiated or activated products for incorporation in stock, poultry and animal feeds, and the license granted to DU PONT under Section 2 (C) of this agreement, shall both become nonexclusive, on ninety (90) days written notice from the FOUNDATION to DU PONT, unless DU PONT shall pay to the FOUNDATION the amount by which such aggregate royalties for such year are less than said sum of dollars, within thirty (30) days after receipt by DU PONT of such notice.

Royalties, as provided for hereinabove, shall be payable only with respect to those operations of DU PONT which are conducted under unexpired patents of the FOUNDATION referred to specifically or otherwise herein and licensed to DU PONT; provided, however, that nothing in this paragraph shall be construed as a contention by DU PONT that its present processes of irradiation of ergosterol and cholesterol are not within the scope of the claims of the patents herein licensed.

7. DU PONT shall not sell activated or irradiated cholesterol and/or its derivatives under any of the licenses herein granted at a higher price than per million U. S. P. X. (Revised 1934) vitamin D units.

8. DU PONT shall keep at its principal office true and particular account of all matters connected with the manufacture and sale of the activated or irradiated products under Sections 2 (A), 2 (B), and 2 (C) hereof and shall furnish to the FOUNDATION within the time specified for the payment of royalties under Section 6 hereof, true and correct statements of the quantity of the products sold. At the request of the FOUNDATION, upon reasonable notice, such records and accounts shall be open to inspection and audit by the FOUNDATION. The records and accounts of DU PONT shall be preserved for at least three years. The FOUNDATION will regard information obtained from such records as confidential.

9. No advertising by DU PONT relating to the products licensed to DU PONT hereunder, shall contain extravagant or unwarranted statements with respect thereto. DU PONT shall not circulate any advertising material (including radio advertising) naming the Steenbock process, the Steenbock patents, the University of Wisconsin, the FOUNDATION, or Dr. Steenbock, without first submitting the same to the FOUNDATION for its approval and receiving said approval.

10. DU PONT shall properly comply with all statutory requirements pertaining to the marking of patented articles.

At the expiration of the term of this contract and all renewals thereof, DU PONT shall not thereafter in its advertising or otherwise, in connection with the sales of its products, use the name of the FOUNDATION or the name of Harry Steenbock.

11. The FOUNDATION shall have the right at any time to inspect and test samples of DU PONT'S irradiated or activated products manufactured under this agreement, and to this end DU PONT agrees to furnish the FOUNDATION, without expense to the FOUNDATION, upon reasonable notice, such reasonable quantity of the products manufactured hereunder, packed or bottled ready for sale, as may be necessary solely for the FOUNDATION to test the potency thereof.

12. The FOUNDATION shall have the right to prosecute suits for infringement of any patents under which DU PONT is operating in accordance with the present agreement, and to defend suits for declaratory judgments concerning such patents, and DU PONT together with all other licensees shall reimburse the FOUNDATION for one-half of the reasonable costs of such litigation both pending and future, incurred during the life of this agreement. DU PONT'S obligation to share in the expense of the afore-mentioned litigation shall be determined in accordance with its proportion of the total royalties received by the FOUNDATION, in the calendar

Digitized by Google

year immediately preceding the termination of any such litigation, from licensees required to share in the expense of such litigation, but in no event shall DU PONT's aggregate liability under the present Section 12 exceed _____ Dollars. It is understood that damages received by the FOUNDATION in any such suit will be applied against the costs of such suit before division of the expenses between the licensees, including DU PONT, as herein provided. DU PONT's contribution toward the expense of any declaratory judgment suit shall be the same proportion as would obtain in an infringement suit prosecuted by the FOUNDATION.

In the event the FOUNDATION fails to institute suit against infringers of patents licensed hereunder it is understood that DU PONT may institute and conduct such suit in the name of the FOUNDATION or in the joint names of DU PONT and the FOUNDATION, after ninety (90) days' notice to the FOUNDATION, and to that end may withhold, from the royalties accruing to the FOUNDATION, one-half of the cost of such suit in excess of the damages and profits recovered by DU PONT therein. Damages and profits received in any such suit may be retained by DU PONT.

If any of the patents herein licensed or any of the claims thereof be declared or decreed invalid or so limited in scope as substantially to affect the licensed monopoly of DU PONT hereunder, by a court of competent jurisdiction, any and all royalty payments due under the present agreement may, at the option of DU PONT, be deposited in escrow with any mutually satisfactory depository, pending any appeal from such decree or mandate and pending final determination as to the validity and scope thereof. If such decree or mandate be appealed within the time allowed by law and finally reversed, so that the licensed monopoly of DU PONT is no longer thereby substantially affected, the amount deposited shall be paid to the FOUNDATION; otherwise it shall be repaid to DU PONT (but DU PONT shall be liable for royalties due to the date of such original decree or mandate) and DU PONT shall not thereafter be liable for any further royalties hereunder. In such event DU PONT shall have the right to cancel this agreement by notice in writing to the FOUNDATION sixty (60) days prior to the effective date of such cancelation.

Furthermore, if the patents licensed to DU PONT hereunder are limited by disclaimer or reissue or otherwise, so as substantially to affect the licensed monopoly of DU PONT hereunder, DU PONT shall be relieved of any obligation to pay royalties hereunder to the FOUNDATION after the effective date of such disclaimer, reissue or other condition so limiting said patents; provided, however, that DU PONT shall pay to the FOUNDATION all royalties accrued up to such date.

13. If any royalties hereinbefore covenanted to be paid shall be in arrears and unpaid for a period of thirty (30) days after the same shall have become payable, or if DU PONT shall permit or allow to be permitted a breach of any of the covenants herein contained on its part to be performed and observed, and shall not remedy such breach within sixty (60) days after written notice is given to it by the FOUNDATION requiring such remedy, or if DU PONT shall become insolvent or commit any act of bankruptcy, or if any order for the compulsory liquidation of DU PONT shall be made by any competent court, the FOUNDATION shall be at liberty in any and every such case, by notice in writing, to determine these licenses, and thereupon the licenses hereby granted, and all rights of DU PONT hereunder, shall forthwith cease and terminate, but without prejudice to the remedy of the FOUNDATION to sue for and recover any royalties then due, and without prejudice to the remedy of either party in respect to any breach of the covenants herein contained.

14. The licenses granted herein shall inure to the benefit of the successors of DU PONT, as well as to the existing or hereafter acquired subsidiaries thereof so long as they remain subsidiaries. A subsidiary, as defined herein, shall be considered a corporation wherein DU PONT owns or controls a majority of the outstanding voting stock. Save for assignments to successors in business, DU PONT shall not assign these licenses or any part of the same without the written consent of the FOUNDATION.

15. It is understood that the FOUNDATION has granted licenses to the following pharmaceutical companies: Abbott Laboratories, Mead-Johnson & Co., Parke-Davis, E. R. Squibb & Sons, and Winthrop Chemical Company, copies of which licenses are hereto attached. The licenses herein granted to DU PONT shall not be construed to prevent such companies from manufacturing and/or selling the activated or irradiated products herein licenses in the fields covered by the licenses so granted to the pharmaceutical companies. Further, notwithstanding the provisions of Section 2 (A) hereof, it is agreed that the FOUNDATION may grant non-exclusive licenses under the patents herein licensed to any or all of the said

Digitized by Google

pharmaceutical companies to manufacture for sale, and to sell, activated or irradiated ergosterol or its derivatives in solutions of medicinally neutral oils containing not less than 10,000 U. S. P. X. (Revised 1934) Vitamin D units per gram and/or activated or irradiated ergosterol or its derivatives with halibut liver oil, such combined product to contain not less than 10,000 U. S. P. X. (Revised 1923) Vitamin D units per gram, for administering the same directly and as such (without having been prior thereto admixed with any other substance) to dogs, cats, and foxes.

16. It is understood that the licenses herein granted to DU PONT are granted subject to the existing license contract dated August 8, 1928, between the FOUNDATION and Standard Brands Inc., as amended, a copy of which agreement with all the amendments thereto is attached hereto and to the existing license contract with The Quaker Oats Company dated February 18, 1927, as amended, a copy of which agreement with all amendments thereto is hereto attached.

17. The FOUNDATION agrees that it will endeavor to treat DU PONT as favorably as any other licensee, and to that end will modify the present agreement in order to correct any injustices which may arise from the grant of licenses to others upon more favorable terms than those set out herein.

18. It is understood that the license herein granted in Section 2 (C) hereof to DU PONT is granted subject to the existing license contract dated July 28, 1934 as amended, between the FOUNDATION and Commander-Larrabee Corporation, a copy of which agreement with said amendment thereto, is attached hereto.

19. The FOUNDATION will use its best efforts to prevent the use in the United States of irradiated or activated products licensed hereunder imported from without the United States except insofar as such importation may be permitted pursuant to the terms of licenses existing on or prior to November 15, 1929, or to DU PONT by this agreement: and the FOUNDATION warrants that it has not granted since November 15, 1929, and it agrees that it will not hereafter grant, any licenses which shall permit the use of such imported products.

20. It is understood that the rights of DU PONT with respect to licensed fields and exclusive nature of said licenses under the present agreement are diminished in no respect whatever as compared with the rights granted Acetol Products, Inc., under the said agreement of November 15, 1929, as amended.

21. The FOUNDATION agrees that it will not hereafter enter into any agreement with a third party by virtue of which it is prevented from granting any licenses to any persons to use products which DU PONT is authorized to make under the FOUNDATION patents hereinabove identified where the result of such licensing will be to discriminate against the use of DU PONT's said authorized products.

22. The FOUNDATION represents and warrants that it has full authority to grant the licenses herein granted to DU PONT.

23. The present agreement embodies all the mutually satisfactory terms entered into by and between the parties hereto, with respect to the subject matter hereof, up to and including the date first hereinabove set forth.

IN WITNESS WHEREOF, the parties hereto have had this agreement executed by their duly authorized representatives and sealed with their respective corporate seals, as of the day and year first hereinabove set forth.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By T. E. BRITTINGHAM, JR., *Vice President.*

Attest: L. M. HANKS.

E. I. DU PONT DE NEMOURS & COMPANY,
By N. T. HARRINGTON, *Vice President.*

Attest: M. D. FISHER, *Asst. Secretary.*

I, HARRY STEENBOCK, in consideration of being discharged from all obligations arising under that certain agreement of November 15, 1929, between the FOUNDATION, Acetol Products, Inc., and myself, as amended, do hereby consent to the cancelation as above provided of said agreement, as amended, as of November 15, 1935.

HARRY STEENBOCK.

Witness: HENRY T. SCOTT.

Digitized by Google

This agreement made this 2nd day of February 1935, between the Wisconsin Alumni Research Foundation, A Wisconsin Corporation not for pecuniary profit (hereinafter called the Licensor) and Ayerst, McKenna & Harrison (U. S.) Ltd., a New York Corporation of Rouses Point, New York (hereinafter called the Licensee),

WITNESSETH:

That, Whereas, the Licensor is a corporation organized and existing under the laws of the State of Wisconsin, for the purpose, among others, of promoting, encouraging, and aiding scientific research at the University of Wisconsin, and providing funds therefor; and

Whereas, the Licensor is the owner of United States Letters Patent No. 1,680,818, issued upon the application of Harry Steenbock, upon Antirachitic Products and Process; and

Whereas the Licensee has negotiated with the Licensor, and now desires to secure a license under said patent for the activation and sale of a food product known as Glucose D, being a compound of Glucose and irradiated ergosterol; It Is Agreed:

I

The Licensor grants to the Licensee a license under United States Letters Patent No. 1,680,818 to purchase and use irradiated ergosterol in and for the manufacture of its product now known and sold as Glucose D, and to sell said Glucose D in the territory hereinafter defined. All irradiated ergosterol that may be used under this license shall be purchased by the Licensee from other licensees of the Licensor licensed to sell such product in the United States. The Licensee shall have no right itself to irradiate ergosterol with ultraviolet rays, nor shall it have the right to resell or otherwise dispose of irradiated ergosterol purchased under this license except as incorporated in said product, Glucose D. The word "activate" as used herein means the enhancement of Vitamin D potency of the Licensee's product Glucose D by the addition thereto of irradiated ergosterol.

All Glucose D manufactured and sold under this license shall contain a Vitamin D potency not in excess of one-half the potency of standard cod liver oil.

It is expressly understood that the licensed product, Glucose D, shall only be sold by the Licensee as a food product, and not as a pharmaceutical product or a drug product. It is further understood that the Licensee shall not, during the life of this license, sell any product under the name Glucose D which product is not a compound of glucose and irradiated ergosterol.

II

The Licensor shall without charge give to the Licensee such assistance, data, and information bearing upon the invention and improvements as shall enable Licensee to best work the invention to the full extent known to the Licensor. Any improvements made or acquired by the Licensor shall be forthwith communicated to the Licensee, whether patented or not, and may be used by the Licensee without payment of further or additional royalty as specified hereinafter.

III

The rights granted to the Licensee under this license to purchase and use irradiated ergosterol in the manufacture of Glucose D shall be nonexclusive and shall extend throughout the United States of America, including territories and possessions thereof, so long as the latter remain under the political jurisdiction of the United States. The rights granted to the Licensee under this license to sell Glucose D extend throughout the world save for Great Britain (including North Ireland and the Isle of Man) and Germany. Within Great Britain, (including North Ireland and the Isle of Man) and Germany, the Licensee may not in any manner directly or indirectly practice the invention of said patent or improvements thereon.

IV

The duration of this license shall be for that length of time measured by the life of United States Letters Patent No. 1,680,818.

Digitized by Google

V

The Licensee agrees to pay to the Licensor within thirty (30) days from the end of each three calendar months' period, while this license agreement is in effect, a sum equivalent to percent of the net sales price of Glucose D sold by it during the preceding three calendar months. The Licensee agrees to pay to the Licensor on the termination of this license by lapse of time or otherwise percent of the net sales price (estimated upon the previous year's business) of the Glucose D manufactured under this license, but not then sold—said sum to be paid within three months after the date of the termination of this license.

The term "Net Sales" means listed selling price to the retailer or jobber, as the case may be, minus discounts to the trade and allowance for returned goods.

VI

The Licensee shall keep at its principal offices true and particular account of all matters connected with the manufacture and sale of Glucose D, and shall furnish the Licensor within the times limited in the preceding paragraph a true and correct statement of the quantity sold, At the request of the Licensor, upon reasonable notice, such records and accounts shall be open to inspection and audit by the Licensor or its agents. The records and accounts of the Licensee shall be preserved for at least two years.

VII

No literature or advertising shall contain extravagant or unwarranted statements. The Licensees shall not in such advertising or literature, without the approval of the Licensor, circulate any material relating to the Steenbock process, the Steenbock patents, the University of Wisconsin, or the Licensor, and such advertising and literature shall first be submitted to the Licensor for its approval. The Licensee shall advertise the licensed product only in those publications which primarily serve the medical profession.

VIII

The Licensee shall properly comply with all statutory requirements pertaining to the marketing of patented articles.

IX

The Licensor shall have the right at any time on reasonable notice to inspect and test samples of the Licensee's products and to this end the Licensee agrees to furnish such quantity of its products as packed ready for sale as may be necessary for the Licensor to test the potency thereof.

X

The Licensee agrees not to furnish free the products covered in this license except for clinical and research purposes only; and at the end of each month the Licensor is to be furnished a list of the names and addresses of those to whom such product is given during that month, together with the amount furnished.

XI

The Licensee shall not assign this license or any part thereof without the written consent of the Licensor first obtained.

XII

The Licensee shall not during the ~~existence~~ of this license dispute the validity of the Licensor's patents under which this license is given.

XIII

If any royalties hereinbefore covenanted to be paid shall be in arrears for a period of thirty days, or if the Licensee permits or allows a breach of any of the covenants herein on their part to be performed and observed, and remedy shall not be made within sixty days after written notice by the Licensor requiring such remedy, the Licensor shall be at liberty in any and every such case by notice in

Digitized by Google

writing to determine this license, and thereupon all rights of the Licensee hereunder shall forthwith cease and terminate, but without prejudice to the remedy or right of the licensor to sue for and recover any royalties then due, and without prejudice to right of either party in respect of any breach of the covenants herein.

XIV

The Licensor shall have the right to prosecute suits for infringement of the Letters Patent by virtue of which the Licensee is operating, and the Licensee, together with all other Licensees under said patent, shall be liable for one-half of the reasonable costs of such litigation.

The Licensor shall have the right, and it shall be its duty, to apportion equitably such one-half of the expenses among other licensees bound by their contracts to bear a portion of such expenses, written notice of which apportionment shall be promptly given by the Licensor to the Licensee, and the Licensee shall not be liable for any amount or amounts so apportioned to any such other Licensee or Licensees.

In the event that suit is brought against the Licensee, charging that acts performed under this license constitute infringement of a United States Letters Patent, the Licensee may defend such suit and deduct the reasonable costs thereof from the royalties accruing under this contract. The Licensor shall not be liable for any sum beyond the amount of such accruing royalties. The Licensor may assist in the defense of any such litigation if it so elects and it shall render such reasonable assistance as the Licensee may require.

XV

The Licensee may, during but not beyond the life of this license, use that symbol, label or design adopted by the Licensor to identify products made and sold under the Steenbock patented process.

XVI

This license is granted subject to, and the Licensee takes this license with notice of the terms and provisions of and the rights under the following existing license agreements to which the Licensor is a party, together with all modifications of said license agreements now in force and in operation, and this license shall not be construed as in any way directly or indirectly covering the fields granted by said licenses or any of them:

Abbott Laboratories
E. R. Squibb & Sons
Winthrop Chemical Company
Mead Johnson & Company
Parke-Davis & Company

all of which are of identical terms.

Witness our hands and seals, and the delivery of this contract, on the date first written.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By GEO. I. HAIGHT, *President.*

Attest:

TIMOTHY BROWN, *Asst. Secretary.*

AYERST, MCKENNA & HARRISON (U. S.), LTD.,
By H. MCPHERSON, *President.*

Attest:

W. HARRISON, *Secretary.*

THIS AGREEMENT, Made this 18th day of February 1927, between WISCONSIN ALUMNI RESEARCH FOUNDATION, a corporation not for pecuniary profit, organized and existing under and by virtue of the laws of the State of Wisconsin, with an office in Madison, Dane County, Wisconsin, hereafter called the "Licensor," and THE QUAKER OATS COMPANY, a corporation organized and existing under and by virtue of the laws of the State of New Jersey, with principal office at Chicago, Cook County, Illinois, hereinafter called the "Licensee," WITNESSETH: That,

Whereas the Licensor is a corporation organized under Chapter 180, Wisconsin Statutes, to promote, encourage, and aid scientific investigation and research at the University of Wisconsin by the faculty, staff, alumni, and students thereof and

Digitized by Google

those associated therewith, and to provide or assist in providing the means and machinery by which their scientific discoveries, inventions, and processes may be developed and applied and patented and the public and commercial uses thereof determined, and by which such utilization or disposition may be made of such discoveries, invention, or processes and patent rights or interests therein, as may tend to stimulate and promote and provide funds for further scientific investigation and research within said university or colleges or departments thereof; and,

Whereas, the Licensor is the owner of an invention upon which application for patent Serial No. 723,171, has been filed in the Patent Office of the United States, by Harry Steenbock, relating to a method of providing antirachitic product of edible character, such as foods and medicines, and to the products obtained by such method of treatment; and,

Whereas, it is necessary to design and build machines and equipment for the practice of the said invention, and whereas so to do may require the expenditure of considerable sums of money to provide the means for practicing the said invention in a commercially advantageous way:

IT IS AGREED:

1. The Licensee agrees faithfully and with reasonable diligence to undertake the manufacture, or to procure the manufacture of machinery and equipment which it shall find practical, necessary and convenient for the best use of the said invention in giving anti-rachitic qualities to the products manufactured and sold by the Licensee—that is to say, rolled oats and oatmeal, puffed rice, puffed wheat and other puffed products, cornmeal and corn flour, pancake flour, macaroni, stock and poultry feeds and other cereal products except wheat and rye flours and except cereal oils and save for breakfast foods except crackers, biscuits, cookies, breads and other similar products of wheat and rye flours, and to pay all the expenses incurred in so doing.

2. The Licensee agrees to keep the Licensor at all times informed of the status of the undertaking by the Licensee in the preceding paragraph made, to apprise the Licensor of discoveries and inventions, if any, in relation to said machinery and equipment in connection with the manufacture and operation thereof and experiments thereon, and also in respect to any methods or inventions used in or relating to said undertaking, thereby granting to the Licensor and its Licensees full and free license to use such methods and inventions in respect to edible foods other than products of the Licensee mentioned in paragraph 1 hereof, and also as to said foods mentioned in paragraph 1 after the exclusive right hereinafter granted by the Licensor to the Licensee shall have expired.

3. The Licensor grants to the Licensee a license to use the invention described in said application No. 723,171, under any patent or patents that shall be hereafter granted on the subject matter of said application, and under any improvements thereon made or acquired by the Licensor in the manufacture and sale of the products described in paragraph 1.

4. The Licensee agrees to pay to the Licensor the sum of Dollars forthwith, and the further sum of Dollars on the first day of February of each year, beginning February 1, 1928, until the Licensee shall manufacture or procure the manufacture of machinery and equipment for the use of said invention, and shall use said invention commercially in connection with the manufacture and sale of one of the products described in paragraph 1 hereof. The use of said invention in connection with the manufacture or sale of one or more of said products in an experimental way shall not be considered a commercial use of said invention. On the first day of February following the commercial use of said invention, the Licensee shall pay to the Licensor the sum of Dollars, and on the first day of February of the year following the sum of Dollars, and on the first day of February of the next year and on the first day of February of each and every year thereafter, during the life or lives of the basic patent or patents which shall be granted under said application for patent described in paragraph 1 hereof, the Licensee shall pay to the Licensor the sum of Dollars.

5. This license shall be exclusive to the Licensee, as to the licensee's products mentioned in paragraph 1, during the experimental period and for ten (10) years after the Licensee shall commence the use of said invention commercially. The purpose of the Licensor in giving the Licensee a limited exclusive grant is to afford the Licensee full opportunity to make itself whole upon the moneys expended by it under paragraph 1 in making commercial the inventions that are the subject matter of this contract, and also to make itself whole under the provisions of paragraph 11 herein following.

Digitized by Google

6. The licensee shall, in suitable manner, affix upon the individual packages in which it sells its goods, made under this license, a legend to the effect that they are made under the Steenbock Process, and the Licensor shall have the right, insofar as it can be secured or can be granted by the Licensee, to use and to grant to others the right to use the said legend or similar legends, and any trade-mark rights that may be secured thereunder or in relation thereto, whether registered or otherwise, as to all products not mentioned in paragraph 1 hereof, and as to those products mentioned in paragraph 1 after the Licensee's exclusive right has terminated hereunder.

7. The Licensee shall, in a suitable manner, affix upon the individual packages in which it sells its goods made under this license agreement, the word "Patented," and the date of the issuance of the patent or patents covering the invention or inventions that are the subject matter of this contract, so soon as patents thereon shall be issued.

8. The grant of the Licensor to the Licensee hereunder shall also estend to any rights in foreign countries in respect to the inventions which are the subject matter of this contract and patents secured thereon, and the licensee agrees to pay therefor a royalty which shall be determined by taking that fraction of the royalty stipulated to be paid by the Licensee for United States rights in which the numerator shall be the amount of the gross sales of the Licensee in said foreign country of products manufactured under said invention and in which the demoninator shall be the gross amount of sales of the Licensee in the United States of such products. The Licensor will, upon request, execute and deliver to the Licensee any and all documents necessary to secure to the Licensee such foreign rights.

9. The Licensee shall not in its regular advertising circulate any advertising material referring to the Steenbock Process, the Steenbock patents, or to the University of Wisconsin, without first submitting said advertising material to the Licensor for its approval. This shall not apply to usual publicity material as distinguished from advertising material.

10. If during the continuance of this license the inventor Steenbock shall make any further improvements in the said invention or in the mode of using the same, rights in which shall be secured by the Licensor, or should the Licensor otherwise become the owner of any such improvements, then and in every such case the Licensor shall communicate the improvement to the Licensee, and the license hereby granted shall apply thereto without the payment of any further royalty than that hereinbefore in this contract stipulated.

11. In case any Letters Patent, under which a license is hereby granted, shall be infringed, the Licensee shall notify the Licensor thereof immediately, and in such case the Licensee may, at its option, take the necessary proceedings effectually to protect the said patent or patents, and to that end use the name of the Licensor. If the Licensee shall take such proceedings, the entire reasonable cost thereof shall be equally divided between the Licensor and the Licensee. In such case, the Licensee shall pay such cost and shall deduct one-half of the previous year's expense from the succeeding year's royalty. If the Licensee shall elect not to take such proceedings, then it shall notify the Licensor, and the Licensor, at its option, may take such proceedings at its own expense. If any profits, damages, or royalties are collected in any suit brought by the Licensee, the amount thereof, less the cost of litigation shall be divided equally between the Licensor and the Licensee.

12. The Licensee shall not at any time dispute the validity of the Licensor's patents. The Licensee shall not assign this license, or any part of the same, or grant any sublicense without the written consent of the Licensor, except that the Licensee, without such consent, may sell or assign this license in connection with the sale or assignment of substantially its entire business, and it may grant sublicenses to subsidiaries of which it shall own substantially all the stock without the payment of additional royalties.

13. It is further provided that if royalties, or any part thereof, shall at any time be in arrears for ninety (90) days after the same shall become due, or in case of default in performing any of the agreements herein contained, then, and in any such case, it shall be lawful for the Licensor by notice in writing given to the Licensee, or left at its usual or last place of business, to revoke this license, which shall thereupon become void without prejudice to any right of action or remedy that the Licensor shall have for the recovery of any moneys then due to it hereunder, or in respect to any antecedent breach of any agreement herein contained.

14. The Licensee may terminate this agreement at any time by giving to the Licensor notice in writing, mailed to the Licensor ninety (90) days prior to the

Digitized by Google

date when such termination shall take effect. Such termination shall not affect any right of action which exists at the time of such termination.

In witness whereof, the parties hereto have caused this agreement to be duly executed the day and year first above mentioned.

CHICAGO, ILL., *October 31, 1930.*

The QUAKER OATS Co.,
Chicago, Ill.

GENTLEMEN: The board of trustees of Wisconsin Alumni Research Foundation has given consideration to the question of reducing the royalty for the year 1931 under the agreement between you and the Foundation, and is satisfied to make such reduction. This letter, if accepted by you, will constitute an amendment of our agreement of February 18, 1927.

We understand that you have expended a very large amount of money in an effort to make profitable use of the Steenbock process, but so far have not succeeded. When we entered into the original agreement, it was contemplated by both of us that you would use the Steenbock process on one of your major products, but we understand you have found this impracticable and are using it only on Muffets and Farina, two of your minor products, and that under the circumstances you feel that you cannot proceed under the contract and will be required to cancel unless some adjustment of the royalty is made.

Our board fully appreciates the situation in which you find yourselves and wishes to cooperate in your endeavor to make a larger use of the process. To that end we agree that you shall pay us a royalty of instead of for the year beginning February 1, 1931.

We understand that you have been selling irradiated products in Canada and Great Britain since sometime in 1928, and that no accounting has been made for royalties. You agree to pay us a royalty for this business of not less than including the year ending February 1, 1931. If it should develop that your sales in Canada and Great Britain, for the period in question, with relation to the United States business, would produce more than on the basis of a United States royalty of per each of these years, then you will pay us such additional sum. With reference to foreign business, for the year beginning February 1, 1931, the terms of the contract will apply upon the basis of a royalty of for the United States. This adjustment for past years and for the year 1931 covers any liability on the part of Quaker Oats, Limited.

Except as modified by this letter, our agreement shall remain in full force.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By GEO. I. HAIGHT, *President.*

Accepted:

MADISON, *December 9, 1930.*

QUAKER OATS Co.,
Chicago, Ill.

(Attention Mr. W. D. McKenzie.)

DEAR SIR: Confirming our conversation of a few days ago I may say that the Foundation has given consideration to your proposal which we understand to be as follows:

1. An experimental period of a year in which to try out the effect of irradiation on corn flakes for Canadian distribution, and rolled oats for distribution in Great Britain, Irish Free State, Germany, and other foreign countries except Canada.

Digitized by Google

2. That the royalties which will be paid the Foundation for such experimental treatment of products for foreign sale will be approximately , which, added to the royalties due from the present foreign business will amount to the sum of for the year 1931, said amount payable on February 1.

3. That at the end of 1931 the Quaker Oats Co. and the Foundation will on the basis of the results then available redetermine a fair and equitable basis for foreign royalties in the future.

We are equally anxious with you to see that these experiments are tried out under as favorable conditions as possible and to make these arrangements practicable, the trustees of the Foundation have authorized me to approve of the proposal made. If you will attach your assent to the duplicate copy of this letter herewith enclosed and return same to me, we will consider this as modifying the license contract dated February 18, 1927.

Trusting that your experimental trials may prove successful, we are

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
HARRY L. RUSSELL, *Director.*

Accepted by Quaker Oats Co.

JOHN STUART.

SUPPLEMENTAL AGREEMENT

Supplemental Agreement made this 11th day of January 1932, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin Corporation not for pecuniary profit (hereinafter called the Licensor) and THE QUAKER OATS COMPANY, a corporation organized and existing under and by virtue of the laws of the State of New Jersey, with its principal office in Chicago, Cook County, Illinois (hereinafter called the Licensee),

WITNESSETH

That, Whereas, the Licensor and Licensee have heretofore, on the 18th day of February 1927, entered into a certain license agreement, whereby the Licensor has granted to the Licensee a license for the manufacture and sale of certain irradiated cereal products, and the Licensee has agreed to make certain royalty payments as therein specified; and

Whereas, the Licensor and Licensee now desire to modify for a period of three years, beginning February 1, 1932, the requirements of said contract of February 18, 1927, relating to royalty payments, it is agreed as follows:

The contract dated February 18, 1927, between the parties hereto, as heretofore amended, is hereby modified as follows:

(a) Instead of the royalties provided for in the contract, the Licensee shall pay to the Licensor for a period of three years, beginning February 1, 1932 and ending January 31, 1935, the sum of per year, payable on or before February 1st of each year, such payment to constitute full payment for such period of the Licensee's royalty obligations under said contract for both United States and foreign business.

(b) The Licensee shall have no right to terminate said contract of February 18, 1927, as amended, prior to January 31, 1935. The Licensee, however, may terminate the agreement on January 31, 1935 by giving the notice provided for in said contract.

(c) In all other respects said contract of February 18, 1927, as heretofore amended, shall remain in full force and effect.

SUPPLEMENTAL AGREEMENT made this First day of December, 1939, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation, not for private profit (hereinafter called the "Licensor"), and THE QUAKER OATS COMPANY, a corporation organized and existing under and by virtue of the laws of the state of New Jersey, with its principal office in Chicago, Cook County, Illinois, (hereinafter called the "Licensee"),

WITNESSETH:

WHEREAS the Licensor and the Licensee heretofore on February 18th, 1927, executed a certain license agreement whereby the Licensor granted to the Licensee a license for the manufacture and sale of certain irradiated cereal products and the Licensee agreed to make certain royalty payments as therein specified; and

Whereas by various supplemental agreements and letter agreements, the said agreement of February 18th, 1927, has been amended from time to time; and

Whereas, the Licensor and Licensee now desire to amend certain sections of said agreement of February 18th, 1927, it is agreed as follows:

I

Section 4 of said license agreement of February 18th, 1927, is hereby amended to read as follows:

"4. The Licensee agrees to pay to the Licensor the sum of on the first day of February of each year, beginning February 1, 1940, during the life of this license."

II

Section 5 of said license agreement of February 18th, 1927, is hereby amended to read as follows:

"5. This license shall be exclusive to the Licensee as to rolled oats and oatmeal during the life of United States Letters Patent No. 1,680,818, and shall be non-exclusive as to all of the other products of the Licensee licensed in Section 1 hereof."

III

Section 6 of said license agreement of February 18th, 1927, is hereby amended to read as follows:

"6. The Licensee shall in suitable manner affix upon the individual packages in which it sells its goods made under this license a legend to the effect that they are made under the Steenbock Process, and the Licensor shall have the right insofar as it can be secured or can be granted by the Licensee to use and to grant to others the right to use the said legend or similar legends and any trade-mark rights that may be secured thereunder or in relation thereto, whether registered or otherwise, as to all products except rolled oats and oatmeal, and as to rolled oats and oatmeal, after the Licensee's exclusive right has terminated hereunder."

IV

Section 8 of said license agreement of February 18th, 1927, is hereby amended to read as follows:

"8. The grant of the Licensor to the Licensee hereunder shall also extend to any rights in foreign countries in respect to the inventions which are the subject matter of this contract and patents secured thereon. The Licensor will upon request execute and deliver to the Licensee any and all documents necessary to secure to the Licensee such foreign rights."

V

The Supplemental Agreement between the parties hereto, dated the 22nd day of October, 1929, is hereby cancelled and terminated.

VI

In all other respects said license agreement of February 18th, 1927, as heretofore amended, shall remain in full force and effect.

IN WITNESS WHEREOF the parties hereto have had this agreement executed by their duly authorized representatives and sealed with their respective corporate seals as of the day and year first hereinabove set forth.

THIS AGREEMENT, made this first day of January 1930, between the Wisconsin Alumni Research Foundation, a corporation not for pecuniary profit, organized and existing under and by virtue of the laws of the State of Wisconsin with an office in Madison, Dane County, Wisconsin, hereinafter called "The Foundation," and The Dry Milk Company, Inc., a corporation existing under and by virtue of the laws of the State of Delaware, with its principal office in New York, New York County, New York, hereinafter called the "Milk Co."

WITNESSETH: Whereas the Foundation is a corporation organized under Chapter 180 of Wisconsin Statutes to promote, encourage, and aid scientific investigation and research at the University of Wisconsin by the faculty, staff, alumni, and students thereof and those associated therewith, and to provide or assist in providing the means and machinery whereby their scientific discoveries, inventions, and processes may be developed and applied and patented and the public, commercial, and humanitarian uses thereof determined and by which such utilization or disposition may be made of such discoveries, invention, or processes and patent rights or interest therein, as may tend to stimulate and promote and provide funds for further scientific investigation and research within said University or colleges or departments thereof; and

Whereas the Foundation is the owner of United States Letters Patent No. 1,680,818 issued August 14, 1928, upon the application of Harry Steenbock upon Antirachitic Products and Processes, and

Whereas the Milk Company has negotiated with the Foundation and now desires to secure a license under said patent for the manufacture and sale of Dryco;

It is Agreed:

1. The Foundation grants to the Milk Company a nonexclusive license to use the inventions described in said patent, and improvements thereon acquired by the Foundation to manufacture Dryco and to sell such product in any part of the world except Great Britain (including North Ireland, Isle of Man) and Germany. The Milk Company shall have the right under this license to increase the antirachitic activity of Dryco by the use of irradiated ergosterol or any other means described in the Steenbock patent on Vitamin D, but any ergosterol so used shall be purchased from the Fleischmann Company (Standard Brands, Inc.) or the Acetol Products Company, so long as obtainable from them. The Licensee shall not increase the activity of Dryco so as to contain a Vitamin D potency exceeding one rat unit per ten grams as defined in the appended supplement to this Agreement.

2. Unless otherwise terminated as hereinafter provided, the duration of this license shall be for the life of United States Letters Patent No. 1,680,818 issued August 14, 1928, but both parties hereto shall have the right to continue to use all improvements which they have taken a license to use hereunder during the life of said letters patent throughout the remaining term of any letters patent covering such improvement.

3. The Milk Company agrees to pay to the Foundation within thirty (30) days from the end of each three calendar month period while this license agreement is in effect per pound for all Dryco manufactured and antirachitically activated hereunder by the said Milk Co. within such period. The Milk Co. guarantees that the royalty payable to the Licensor under the terms of this section will not be less than for each year of this license.

It is recognized that the rate of royalty specified in this license agreement is a preferential rate which is agreed to by the licensor only in view of the anticipated value of the Supplee patent applications.

4. The Milk Co. shall keep, at its principal office, a true record of the manufacture of Dryco under this license and shall furnish to the Foundation, within the thirty days mentioned in Paragraph No. 3, a true and correct statement of the quantities of Dryco manufactured during the immediately preceding royalty period. At the request of the Foundation, upon reasonable notice, such records shall be open to inspection and audit by the Foundation or its agent. The records and accounts shall be preserved for at least two years. The Milk Co. shall not be obliged to disclose the names of its customers.

5. The Milk Co. shall properly comply with all statutory requirements pertaining to the marking of patented articles.

The Milk Co. agrees that upon reasonable notice from the Foundation, it will place upon all its sales packages, and in all its advertising matter, a symbol or design, selected by the Foundation, when and wherever consistent with its business interests, showing that the product is manufactured and sold by virtue of a license from the Wisconsin Alumni Research Foundation.

Digitized by Google

At the expiration of the license term of this contract, or any extension thereof, the Milk Co. shall not thereafter in its advertising or otherwise, in connection with the sales of its products, use the name of the Foundation, the name of Dr. Steenbock, or the design or symbol heretofore mentioned in this section.

6. The Milk Co. agrees to apprise the Foundation promptly of all discoveries and inventions it has or may hereafter have during the life of this agreement, relating to equipment or processes for imparting antirachitic qualities to milk and its products, on which it may have made patent application (including the Supplee applications), hereby granting to the Foundation and its other or future licensees full license throughout the world as to all suitable products to use such discoveries and inventions subject to the conditions hereinafter named.

The Milk Co. shall diligently prosecute the Supplee patent applications (however named) wherever filed and shall bear all expenses connected therewith and in the event that any such claims are disallowed by the Examiner wherever filed, the Milk Co. shall so inform the Licensor so that all measures may be taken to secure favorable action. In granting licenses under the Milk Co.'s patent or patents, the number and date of issue thereof shall be specified in each license granted. And the Licensor agrees to pay to the Milk Co. % of all moneys it receives as license royalty upon said patents. The Milk Co. shall be obligated to maintain and pay taxes on such patents in foreign countries so long as its share of the royalties thereon is at least equal to the total of such expense involved.

7. No advertising shall contain extravagant or unwarranted statements. The Milk Co. shall not, in its advertising, without the approval of the Foundation, circulate any advertising materali relating to the Steenbock process, the Steenbock patents, the Universiry of Wisconsin, the Licensor or Dr. Steenbock; and such advertising material shall first be submitted to the Foundation for its approval.

8. If during the continuance of this license the inventor Steenbock, or any other inventor, shall make any further improvements in the said invention or in the mode of using the same in connection with Dryco or shall make any other inventions relating to methods of imparting antirachitic qualities to Dryco and means thereto, rights in which shall be secured by the Foundation, or should the Foundation otherwise become the owner of Licensee (with right to sub-license others) of any improvements and inventions relating to methods of imparting antirachitic qualities to Dryco and means thereto, and then and in every such case the Foundation shall promptly communicate the improvement and/or invention to the Milk Co. and, at the written request of the Milk Co., shall grant a license to the Milk Co. under any such improvement, and/or invention without the payment of any further royalty by the Milk Co. than that hereinbefore in this agreement stipulated.

9. The Foundation shall have the right to prosecute suits for infringement of any of the Letters Patent by virtue of which the Milk Co. is operating, and the Milk Co., together with all other Licensees, shall be liable for one-half of the reasonable costs of such litigation.

The Foundation shall have the right, and it shall be its duty, to apportion equitably such one-half of the expenses among other Licensees bound by their contracts to bear a proportion of such expenses.

10. The Milk Co. shall not, while this agreement is in force, dispute, in any suit brought against it for violation of any of the provisions of this agreement, the validity of the Foundation's patents under which it has accepted and may then hold a license. The Milk Co. may at any time surrender or refuse to accept a license under any patent or claim thereof other than Steenbock's patent No. 1,680,818 without surrendering any other rights which it may then hold under this agreement.

11. The Milk Co. shall not assign this license, or any part of the same, except in connection with the transfer or sale of its entire business, without the written consent of the Foundation; and shall not grant sublicenses.

12. It is further provided that if royalties or any part thereof shall at any time be in arrears, or in case of default by the Milk Co. in performing any of the agreements herein contained, the Foundation shall notify the Milk Co. of such arrears, or of such default. Such notification shall be in writing, sent by registered mail to the Milk Co., addressed to its usual or last place of business. If within sixty (60) days thereafter the Milk Co. shall not have made up the arrears of royalty or repaired the default, then, and in any such case, it shall be lawful for the Foundation to revoke this license without prejudice to any right of action or remedy that the Foundation shall have or for the recovery of any moneys then due to it hereunder, or in respect to any antecedent breach of any agreement herein contained.

Digitized by Google

13. The Milk Co. may terminate this agreement at any time after one year from the date hereof by giving the Foundation notice in writing, by registered mail, mailed to the Foundation ninety (90) days prior to the date when such termination shall take effect Such termination shall not affect any right of action which may exist at the time of such termination nor the provisions of Section II hereof, and shall not terminate the right of the Foundation, and of such of its licensees and sublicensees as may on the date on which the termination takes effect, hold written licenses from the Foundation or from its licensees, as the case may be, under any patent rights of the Milk Co., in accordance with the provisions of Section 6 hereof, from continuing to use the inventions specifically referred to in such written licenses; nor shall the Milk Co. be barred from thereafter, and with respect to any use after such termination, making any and all defenses in any suit under the Foundation's patents hereinabove referred to as if this license agreement has never been made.

14. This license is expressly subject to provisions contained in Sections I, II, III, IV, and V of the contract dated August 8, 1928, between the Wisconsin Alumni Research Foundation and the Fleischmann Company.

In witness whereof, the parties hereto have caused this agreement to be duly executed the day and year first above mentioned.

SUPPLEMENT

DEFINITION OF A RAT UNIT

A rat unit of vitamin D is that amount of vitamin D which will produce a narrow and continuous line of calcium deposits in the metaphyses of the distal ends of the radii and ulnae of standard rachitic rats, as described below, when fed under standard conditions as described below. Parenthetically it may be stated that an average cod liver oil taken as standard for limiting the concentration of pharmaceutical preparations contains one rat unit of vitamin D in each 75 mgs. This can therefore be taken as a point of reference.

Rats suitable for test as standard rachitic rats may be prepared as follows: they must be born of and reared by rats kept on a stock ration low in antirachitic potency until they have attained an approximate weight of 60 grams at an age of 25 to 30 days in litters not larger than six to which number all litters must be reduced at an age of one week.

A ration suitably low in antirachitic potency for this purpose has the following composition: yellow corn 71, linseed oil meal 16, crude casein 5, alfalfa meal 2, butterfat 5, bone ash 0.5, sodium chloride 0.5—fed with fresh whole milk and water ad libitum. All the constituents of the solid portion of the ration must be finely ground so as to prevent selection by the animals. If fresh whole milk is not available there may be used instead a mixture of whole milk powder, 1 part, and the aforedescribed solid grain mixture, 2 parts.

When the rats as produced above have reached the approximate weight of 60 grams they are made standard rachitic rats by transference to and maintenance on a very finely ground richets-producing diet (Ration 2965, J. B. C. 64,263, 1925) consisting of yellow corn, 76; wheat gluten, 20; calcium carbonate, 3; and sodium chloride, 1. Maintenance on this diet must be continued for from 21 to 30 days, the exact time being determined by the rapidity with which rachitic symptoms develop. They are suitable for test as standard rachitic rats when they have developed a peculiar shambling wobbly gait, characterized best by their walking "down in the haunches" rather than "up on the toes." When they have reached this rachitic state they must be taken for test within a few days, otherwise the skeletal tissues may become excessively impoverished in calcium salts, which impoverishment is not evidenced by increase in the width of the rachitic metaphyses, but nevertheless it makes the animals less susceptible in response to vitamin D effects. Having attained a suitable rachitic condition, the rats are weighed and segregated individually in small cages provided with shavings as litter.

Digitized by Google

The standard feeding conditions are as follows: The desired amount of supplement is incorporated thoroughly in 50 grams of the aforedescribed 2965 ration. This is fed to the rachitic rat with daily record of consumption until consumed. The rat is then given unsupplemented 2965 ration until 10 days have elapsed counting from the beginning of the supplementary period.

The effect of feeding supplemented ration is determined as follows: The animals are killed at the end of the 10-day period by means of ether and the distal ends of the radii and ulnae are examined for calcium deposits according to the Johns Hopkins technique (J. B. C. 5k, 41, 1922). However, the use of a microscope for the examination of the specimens is not necessary. Evidences of congestion in the rachitic metaphyses should be carefully distinguished from calcium salts stained with silver, and tests with rats showing poor consumption should be discarded. Failure of consumption for a day at the beginning of the test will not lead to erroneous results, but failure for two days may and usually does. If the removed bone specimens are kept in 10 percent of formalin for a few hours they will stain more distinctly.

Interpretation of results. When the observed calcium deposits are more extensive than a narrow line the test should be repeated using smaller amounts of supplement, because a correct evaluation is possible only when the calcium deposits approach in amount a narrow continuous line. If the deposits are more extensive the preparation subject to test should be fed in smaller amounts until the desired results as expressed above are approximated. At least ten rats should be used for each test and the average response taken for the results.

In the case of materials which contain large amounts of phosphorous or calcium which make it necessary to compare the untreated with the treated by other means that the line test, for instance by comparative ash content of bone, the increase in vitamin D content in the treated material can be arrived at by determining the amount of standard cod-liver oil which must be added to the untreated material to produce the same effect.

Letter Agreement

Wisconsin Alumni Research Foundation,
Madison, March 24, 1930.

Mr. L. M. Hanks,
First National Bank, Madison, Wisconsin.

Dear Mr. Hanks:

LIMITATION OF COST OF LITIGATION IN CONNECTION DRY MILK COMPANY

In connection with Article 9 of the Dry Milk Company contract relative to cost of possible litigation it was agreed between the Foundation representatives and the Dry Milk Company representatives that the liability of the Dry Milk Company for costs in case of any possible litigation would be limited to a sum not in excess of for their portion. The contract calls for a distribution of one-half of the reasonable costs of any litigation among all of the licensees, and Mr. Callan was anxious to have a specific limitation put upon this amount, which amount of would be satisfactory to his company.

Mr. Hobbs and I objected to putting this into the contract but said that we would furnish a statement to this effect that could be considered as a part of the contract as a side arrangement. Will you therefore attach this note to the Dry Milk Company's contract so that our records may show the arrangement which was entered into?

Very truly yours,

Wisconsin Alumni Research Foundation,
Per (Signed) H. L. Russell.

Supplemental Agreement

This supplemental agreement made this 17th day of August 1933, between the Wisconsin Alumni Research Foundation, hereinafter called the "Foundation" and The Dry Milk Company, Inc., hereinafter called the "Milk Company,"

Witnesseth:

That, Whereas, said parties have heretofore, on January 1, 1930, entered into a certain license contract relating to the irradiation of Dryco under patent rights owned by the Foundation; and

Digitized by Google

Whereas, the Supplee patent applications referred to in Sections 3 and 6 of said contract consisted of a United States application upon which Supplee Patent No. 1,817,936 was granted on August 11, 1931, and various foreign applications corresponding thereto on which Canadian Patent No. 306,562, dated December 9, 1930, British Patent No. 298,585, dated June 11, 1927, French Patent No. 636,749, dated June 25, 1927, Spanish Patent No. 103,342, dated November 26, 1927, and Italian Patent No. 268,211, dated August 29, 1927, have issued and a German application which is still pending, such applications being the only Supplee applications owned or controlled by the Milk Company, relating to irradiation of milk or milk products; and

Whereas, by Section 6 of said license agreement the Milk Company granted the Foundation the right to grant licenses under patents issued on said Supplee applications upon terms which the parties desire to change as hereinafter provided; and

Whereas, said Supplee patents are in the nature of an improvement upon the processes and products claimed in the Foundation's Steenbock Patent No. 1,680,818, and corresponding foreign patents or applications, and it is the desire of the Foundation to grant licenses jointly under the Supplee and Steenbock patents without specifying in said licenses the proportion of total royalty received which is specifically applicable to the Supplee patent; Now, therefore, it is agreed as follows:

I

Section 6 of said contract of January 1, 1930, is hereby amended to read as follows:

"6. Milk Company agrees to apprise the Foundation promptly of all discoveries and intentions it has or may hereafter have during the life of this agreement, relating to equipment or processes for imparting antirachitic qualities to milk and its products, on which it may have made patent applications (including United States Supplee Patent No. 1,817,936, dated August 11, 1931, and various foreign applications corresponding thereto on which Canadian Patent No. 305,562, dated December 9, 1930, British Patent No. 298,585, dated June 11, 1927, French Patent No. 636,749, dated June 25, 1927, Spanish Patent No. 103,342, dated November 26, 1927, and Italian Patent No. 268,211, dated August 29, 1927, have issued and a German application which is still pending), hereby granting to the Foundation and its other or future licensees, full license throughout the world as to all suitable products to use such discoveries and inventions subject to the conditions hereinafter named.

"The Milk Company shall diligently prosecute said Supplee German patent application, and shall bear all expenses connected therewith and, in the event that any claims therein are rejected by the Examiner, the Milk Company shall inform the Foundation so that the Foundation may have an opportunity to cooperate with the Milk Company to secure favorable action. If the Milk Company at any time decides that it does not wish to further prosecute said Supplee German application, it shall notify the Foundation in writing of its decision and, if requested in writing by the Foundation, shall assign said German application to the Foundation, and, upon such assignment, or in the absence of a written request from the Foundation to assign within thirty (30) days after such notice of its decision, the Milk Company shall have no further obligation to prosecute such German Supplee application or bear any future expenses connected therewith.

"The Milk Company shall be obligated to maintain and pay taxes on said foreign Supplee patents owned or controlled by it so long as the royalty payments which it receives from the Foundation as hereinafter provided are at least equal to the total expense involved in maintaining said foreign patents in question.

"In consideration of the right to grant licenses to others under said Supplee patent No. 1,817,936, and said foreign patents corresponding thereto which may be granted to and owned by the Milk Company, the Foundation agrees to make to the Milk Company the following payments within thirty (30) days after the royalty payments to Foundation are received out of which the payments to the Milk Company are to be made:

"1. In all cases in which the Foundation grants licenses for the irradiation of fluid milk by ultraviolet rays under any of its own patents and/or said Supplee patent No. 1,817,936 and/or any foreign patent corresponding thereto owned by the Milk Company, percent of all royalties received by the Foundation for such licenses granted under any one or more of such patents. The term 'fluid milk', as used herein means the normal lacteal secretion of the cow (including raw milk, pasteurized milk, skimmed milk, and buttermilk, as these terms are commonly understood in the trade), when sold for consumption as such.

Digitized by Google

"2. In all cases in which the Foundation grants jointly licenses under Supplee patent No. 1,817,936 (or foreign patents corresponding thereto owned by the Milk Company) and other patents owned or controlled by the Foundation (or under any such Supplee patents alone) for the irradiation of dairy products other than fluid milk, as, for instance, evaporated milk, condensed milk, or other dairy products securing their source of vitamin D from the addition thereto of irradiated milk _____ per cent of all royalties received by the Foundation for such licenses; provided, however, that such payments shall only be made in cases where the invention claimed in such Supplee patent is actually used by the licensee.

"In the event that disputes arise between the Foundation and the Milk Company as to whether or not the invention claimed in the Supplee patent is being actually used by the Licensee, the parties agree to settle each such dispute by arbitration as hereinafter provided and to abide by the award of the majority of the arbitrators.

"In the event that such arbitration is required, the board of arbitrators shall consist of three members, one of which shall be appointed by each party and the two thus appointed shall select a third. If either party refuses or neglects to appoint an arbitrator within thirty (30) days after written request by the other party so to do, or if the two arbitrators appointed fail to select a third within thirty (30) days after the appointment of the second arbitrator, either party hereto may call upon the President of the United States Chamber of Commerce to appoint such arbitrator or arbitrators as the case may require.

"Such arbitration proceedings shall be strictly private between the Foundation and the Milk Company. The arbitrators shall prescribe the procedure to be followed by the parties in presenting the matter for their consideration and the decision of the majority of the arbitrators shall be binding upon both parties, except as qualified in this paragraph. Each party shall be responsible for the compensation of the arbitrator appointed by it and share equally the compensation of the third arbitrator. The other expenses of arbitration shall be paid by either party or both as the arbitrators may direct. The decision of the arbitrators shall bind the parties only for the purpose of determining the allocation of royalties between the Supplee patents and patents owned or controlled by the Foundation, pursuant to paragraph 2 of this section 6.

"In granting licenses under a patent or patents of the Milk Company other than said Supplee patent No. 1,817,936 and/or said foreign patents corresponding thereto, the number and date of issue of each Milk Company patent shall be specified by the Foundation in each license so granted unless otherwise agreed. The Foundation agrees to pay to the Milk Company percent of all monies it receives as license royalties upon said patents."

II

Cancellation or termination of said license contract of January 1, 1930, shall not operate as a termination of the Foundation's rights to use or grant licenses under said Supplee patent No. 1,817,936 and/or said foreign patents corresponding thereto, owned by the Milk Company so long as the Foundation continues to make the payments to the Milk Company provided for in Section 6 of said agreement as amended in Article I hereof for such rights under said Supplee patents.

III

In the event said Supplee Patent No. 1,817,936 shall be declared invalid by any court of last resort, or any lower court from whose decision no appeal is taken within the time allowed by law, the payments for the right to grant licenses under said Supplee patent No. 1,817,936 and/or any foreign patents corresponding thereto provided for in Section 6 of said agreement of January 1, 1930, as amended by Article I hereof, need not thereafter be made by the Foundation to the Milk Company.

IV

If the Foundation by written notice requests the Milk Company to bring suit for infringement of said Supplee patent, setting forth in said notice information which would lead a reasonable man to believe that infringement is being committed, and the Milk Company does not within ninety (90) days after such request bring suit for infringement of said patent, the Foundation shall have the right to bring a suit at its own expense in the name of the Milk Company and

Digitized by Google

to retain for its own use any judgment collected therein, provided, however, that the Milk Company shall not be requested to bring or prosecute more than one suit at a time for the purposes of this section.

AGREEMENT

This Agreement made this 28th day of February 1934, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation, not for pecuniary profit, hereinafter called the "Foundation", the DRY MILK COMPANY, INC., a Delaware corporation, hereinafter called "Milk Company", and THE BORDEN COMPANY, a New Jersey corporation, hereinafter called "Borden";

WITNESSETH:

That whereas, the Foundation and the Milk Company, on January 1, 1930, entered into a certain License Agreement relating to the irradiation of DRYCO under patent rights owned by the Foundation; and

Whereas, the Foundation and the Milk Company, on August 17, 1933, entered into a certain Supplemental Agreement supplementing said agreement of January 1, 1930; and

Whereas, Borden is the owner of the entire capital stock of the Milk Company; and

Whereas, Borden and the Milk Company and the National Carbon Company, Inc. (a New York corporation which is not affiliated in any way with Borden or the Milk Company) have jointly worked upon the development of types of apparatus or processes, for which the Supplee-Dorcas application specified in the next paragraph were filed, suitable for the practice of the processes described and claimed in United States Letters Patent No. 1,680,818 owned by the Foundation, and the exact interests which Borden, the Milk Company and the National Carbon Company own respectively in said Supplee-Dorcas inventions and applications will have to be settled by agreement between said three companies; and

Whereas, Borden and the Milk Company own approximately a 50% undivided interest in the said applications for United States Letters Patent, Serial No. 690410, filed September 21, 1933, and Serial No. 690411, filed September 21, 1933 of G. C. Supplee and M. J. Dorcas, and any patents to be issued thereon, relating to apparatus and processes suitable for the practice of the processes described and claimed in United States Letters Patent No. 1,680,818, owned by the Foundation; and

Whereas, Borden and the Milk Company expect to make arrangements with National Carbon Company, Inc., with respect to their joint interests in said inventions, whereby Borden will be entitled by reason of its said interest to receive, save in some instances, ------% of the royalties collected from licensees under said two Supplee-Dorcas patent applications and any patents to be issued thereon; and

Whereas, all of the parties hereto are desirous of modifying in certain particulars said Agreement of January 1, 1930 between Foundation and the Milk Company, as amended by said Supplemental Agreement of August 17, 1933, between said parties and of entering into certain contractual undertakings relating to said two Supplee-Dorcas patent applications and other matters;

Now, therefore, in consideration of one dollar and other good and valuable considerations and of the mutual covenants and conditions herein contained, the parties hereto agree as follows:

I

The Foundation grants to Borden and its subsidiaries a nonexclusive license to use the invention described in Letters Patent No. 1,680,818 and improvements thereon acquired by the Foundation, to manufacture and sell the product sold by Borden and/or its subsidiaries under the name "KLIM," under the same terms

Digitized by Google

and upon the same conditions (except as hereinafter provided) as the Foundation, under the License Agreement of January 1, 1930, between the Foundation and the Milk Company, granted to the Milk Company a nonexclusive license to use the invention in said Letters Patent No. 1,680,818 and improvements thereon acquired by the Foundation in the manufacture and sale of the product sold by said Milk Company under the name "DRYCO." Each and every clause of said Agreement of January 1, 1930 (except as hereinafter provided) as applied to the product KLIM shall be considered a part of the license herein granted to Borden and its subsidiaries as if incorporated herein; provided, however, that the minimum guarantee contained in Clause 3 of said License Agreement of January 1, 1930, which is as follows:

> "The Milk Company guarantees that the royalty payable to the Licensor under the terms of this section will not be less than $_____ for each year of this license,"

shall be the minimum annual royalty payable to the Licensor by the Milk Company and/or Borden and/or subsidiaries of either of them collectively for the manufacture and sale both by the Milk Company of DRYCO and by Borden and/or its subsidiaries of KLIM, as provided by said License Agreement of January 1, 1930, and by this agreement, and provided, further, that Clause 6 of said Agreement of January 1, 1930, either as originally existing or as amended by said Supplemental Agreement of August 17, 1933, shall not be considered as a part of or as a term or condition of this clause of this agreement.

II

The Milk Company and Borden agree that no product made under this Agreement or under the License Agreement of January 1, 1930 between the Foundation and the Milk Company, as amended by the Supplemental Agreement of August 17, 1933, between said parties, including DRYCO and KLIM, shall be knowingly used and/or directly or indirectly knowingly sold by the Milk Company and/or Borden and/or subsidiaries of either of them as a source of Vitamin D for any other product or products whatsoever, whether or not the manufacturer or producer of such other product or products is or is not a licensee of the Foundation, when such other product or products are intended to be sold or resold on a commercial basis.

III

The Milk Company and Borden agree to pay to the Foundation _____ % of the gross royalties received by them and/or either of them and/or by subsidiaries of either of them from licenses that have been or may be hereafter granted for the use of the inventions described and claimed in the two Supplee-Dorcas patent applications, Serial No. 690410 and Serial No. 690411 now pending in the United States Patent Office and/or in any patents that may be granted thereon. The Milk Company and Borden fruther agree to pay to the Foundation _____% of the gross royalties received by them and/or either of them and/or subsidiaries of either of them for the use of any and all discoveries and inventions that the Milk Company and/or any of its subsidiaries now owns or has an interest in or may hereafter own or acquire an interest in during the life of the Steenbock Patent No. 1680818 (except purchased patents as hereinafter defined and provided for) relating to equipment, apparatus, machinery or processes for imparting antirachitic properties to milk and its products by direct or indirect irradiation, including any and all improvements upon the inventions described in said two Supplee-Dorcas patent applications, on which there are now or hereafter may be patent applications filed and/or patents issued in the United States or elsewhere. The Milk Company and Borden further agree to pay to the Foundation _____ % of the gross royalties received by them and/or either of them and/or subsidiaries of either of them for the use of any and all discoveries and inventions that Borden and/or any of its subsidiaries (except the Milk Company) now owns or has an interest in or may hereafter own or acquire an interest in during the life of the Steenbock Patent No. 1680818 (except purchased patents as hereinafter defined and provided for) relating to equipment, apparatus, machinery or processes for imparting antirachitic properties to milk and its products by direct or indirect irradiation, including any and all improvements upon the inventions described in said two Supplee-Dorcas patent applications, on which there are now or hereafter may be patent applications filed and/or patents issued in the United States or elsewhere.

Digitized by Google

The Milk Company and Borden further agree to pay to the Foundation, in the event of the sale by them or by either of them or by subsidiaries of either of them of any of the patents, patent applications or inventions referred to in this clause of this agreement, the same percentage of the proceeds of such sale as under this clause of this agreement the Foundation would be intitled to receive from the gross royalties collected by Borden and/or the Milk Company and/or subsidiaries of either of them from Licenses under said patents, patent application or invention.

It is agreed that Borden and Milk Company may make any contract with National Carbon Company, Inc., that they may desire to definitely determine their respective interests in said Supplee-Dorcas applications, so long as Borden and the Milk Company endeavor in good faith to secure as large an interest as practical and that such contract is not to be construed as a sale of Borden or Milk Company patents, patent applications or inventions within the meaning of the preceding paragraph.

A purchased patent is defined as a patent or patent right acquired hereafter by Borden and/or the Milk Company and or subsidiaries of either of them for money consideration paid to persons or corporations other than affiliated or subsidiary corporations of Borden and/or the Milk Company. In the case of each or any of such purchased patents, the Foundation shall not be entitled to receive any share of the royalties or selling price paid to Borden and/or the Milk Company and/or subsidiaries of either of them for the use or sale of inventions covered thereby unless and until such royalties or selling price have amounted to such an amount as will reimburse Borden and/or the Milk Company and/or any of such subsidiaries for the consideration paid therefor, with interest thereon at —% per annum from the date such consideration was paid. Thereafter the Foundation shall be entitled to share in the royalties and/or proceeds of sale received by Borden and/or the Milk Company and/or subsidiaries of either of them as is above provided in case of future inventions of Borden and/or the Milk Company and/or subsidiaries of either of them. It is understood and agreed that from and after the date of this Agreement all future inventions, patents or patent rights made or acquired by the Milk Company, which would but for this Agreement be dealt with in accordance with the provisions of clause 6 of said Agreement between Foundation and the Milk Company of January 1, 1930 as amended by said Supplemental Agreement of August 17, 1933, shall be dealt with as provided in Clause III of this Agreement instead of as provided in said Clause 6.

It is understood and agreed that the rights of the Foundation with respect to Supplee Patent No. 1,817,936 are as provided in said Agreement between the Milk Company and the Foundation, dated January 1, 1930, as amended and modified by said Supplemental Agreement of August 17, 1933, and that Borden's ownership of said patent is subject to the rights therein granted by the Milk Company to the Foundation. It is further agreed that the license to Borden and its subsidiaries under said Supplee patent included in the License Agreement between the Foundation and Borden relative to unsweetened evaporated milk, dated February 28th, 1934, and the letter agreement dated February 28th, 1934, modifying and interpreting the same, was included therein so that the contract executed by Borden should be identical in form with the contract executed by the other licensees named therein, and such inclusion shall not be used for the purpose of construing or interpreting or modifying the respective rights which the Milk Company, Borden, and the Foundation enjoy with respect to said Supplee patent by virtue of said agreements of January 1, 1930, and August 17, 1933.

It is understood and agreed that so long as Borden continues to pay the minimum annual royalty provided for in the terms of said license agreement between the Foundation and Borden with respect to the irradiation of unsweetened evaporated milk, dated February 28th, 1934, and the letter agreement, dated February 28th, 1934, construing and modifying the same, the Foundation will not under the arbitration provisions of said Supplemental Agreement of August 17, 1933, between the Milk Company and the Foundation, contend that the said Supplee Patent No. 1,817,936, is not used in the irradiation of unsweetened evaporated milk under Steenbock Patent No. 1,680,818 by any person or corporation now or hereafter licensed by the Foundation to irradiate unsweetened evaporated milk, provided, however, that nothing contained herein shall affect the right of the Foundation to contend that said Supplee Patent No 1,817,936 is not used in the irradiation of unsweetened evaporated milk by licensees of the Foundation in the event of cancellation by Borden of said License Agreement between the Foundation and Borden with respect to the irradiation of unsweetened evaporated milk under the terms of said agreement relating to cancellation thereof, or cancellation by the Foundation under the terms thereof by reason of a default by Borden or in the event of the expiration of said License Agreement without renewal by Borden under the terms thereof.

IV

In consideration of the Foundation's waiver of its claim to and interest in or under the two Supplee-Dorcas patent applications, No. 690,410 and No. 690,411, and other Milk Company inventions, save that provided for in this contract, the Milk Company and Borden agree that they will not use said Supplee-Dorcas inventions or other inventions referred to in clause III in the proceeds of which the Foundation is given an interest, in such a way as to aid others in infringing the Foundation's patents, and that end agree that in every license that may hereafter be granted during the life of Steenbock Patent No. 1,680,818 by Borden and/or the Milk Company and/or subsidiaries of either of them to use the inventions described and claimed in the said two Supplee-Dorcas patent applications and/or in the patents that may be issued thereon and/or to use any improvement that may hereafter be made in said inventions and/or to use any invention Borden and/or the Milk Company and/or subsidiaries of either of them now own or have an interest in or may hereafter own or acquire an interest in during the life of this agreement relating to equipment, apparatus or machinery suitable for use in imparting antirachitic properties to milk and its products by direct or indirect irradiation, there will be inserted a limitation restricting said licensee during the life of Steenbock Patent No. 1,680,818 under any of said patents, patent applications or inventions from

(1) making for sale and/or from selling for use and/or from leasing machines or apparatus made under said license to persons not already licensed by the Foundation to irradiate milk or its products by the use of ultra violet rays, and

(2) delivering said machines or apparatus to the purchasers and/or lessees thereof without first obtaining from the Foundation its written authorization to deliver said apparatus or machines to said purchasers or lessees.

For the same consideration and to the same end, the Milk Company and Borden further agree that in the event that any machine or apparatus embodying and/or for use in accordance with any of the patents, patent applications, and inventions referred to in clause III of this agreement is manufactured for sale and/or lease by Borden and/or Milk Company and/or subsidiaries of either of them during the life of Steenbock Patent 1680818:

(*a*) no such machine or apparatus will be sold and/or leased to any person not already licensed by the Foundation to irradiate milk or its products by the use of ultra rays, and

(*b*) no such machines or apparatus will be delivered to any purchaser and/or lessee thereof without the written authorization of the Foundation to deliver said apparatus or machines to such purchaser or lessee.

The Foundation agrees that it will, during the life of Steenbock Patent No. 1680818, at the request of the Milk Company and/or Borden and/or Licensees of either the Milk Company or Borden under any of the patents, patent applications, or inventions referred to in clause III of this agreement, grant a nonexclusive license for the direct irradiation of fluid milk by the use of ultraviolet rays to any prospective purchaser and/or lessee from the Milk Company, Borden or their licensees as aforesaid, of any apparatus or machine suitable for the direct irradiation of fluid milk by the use of ultraviolet rays and embodying any of the inventions referred to in this clause of this agreement, manufactured by the Milk Company and/or Borden and/or licensees of either of them under any of the patents, patent applications, or inventions referred to in this clause of this agreement; provided, however, that said prospective purchaser or lessee is, in the opinion of the Foundation, a person or concern of a sufficiently high degree of reliability and integrity as to justify the Foundation in granting such license.

V

Cancellation or termination of the License Agreement of January 1, 1930, between the Foundation and the Milk Company and/or cancellation or termination of the license herein granted to Borden to irradiate the product KLIM and/or cancellation or termination of the License Agreement between the Foundation and Borden with respect to the irradiation of unsweetened evaporated milk, dated February 28, 1934, and the letter agreement, dated February 28, 1934, modifying and interpreting the same, shall not operate as a termination of the Foundation's rights to receive the respective percentages of royalties and/or proceeds of sale from the patents, patent applications and inventions set forth and provided for in clause III of this agreement, so long as the Foundation shall

Digitized by Google

continue to make the payments to the Milk Company it is obligated to make by clause VI of said agreement of January 1, 1930, between the Foundation and the Milk Company, as amended by said Supplemental Agreement of August 17, 1933, between said parties and as modified by this agreement.

IN WITNESS WHEREOF, the parties hereto have by their respective duly authorized officers, set their hands hereto and caused their respective corporate seals to be affixed the day and year first above written.

SUPPLEMENTAL AGREEMENT

This Supplemental Agreement made this First day of May, 1937, between the Wisconsin Alumni Research Foundation, hereinafter called the "Foundation" and the Casein Company of America, Inc., hereinafter called the "Casein Company".

WITNESSETH:

Whereas the Foundation and the Dry Milk Company, Inc., a Delaware Corporation, on January 1st, 1930, entered into a certain license agreement relating to the irradiation of the Dry Milk Company's product known as Dryco, under certain patent rights owned by the Foundation, and

Whereas said license agreement was modified in certain respects by a certain supplemental agreement entered into between the Foundation and the Dry Milk Company, Inc., on August 17th, 1933, and by a certain agreement entered into by the Foundation, the Dry Milk Company, Inc., and the Borden Company, a New Jersey corporation, on February 28th, 1934, and

Whereas since the date of said original license agreement of January 1st, 1930, and of said other agreements above referred to, the Dry Milk Company, Inc., and the Casein Company were merged into a corporation known as the Casein Company of America, Inc., and

Whereas the parties hereto desire to further modify said license agreement of January 1st, 1930, as heretofore amended. Now, therefore, it is agreed as follows:

I

The second sentence of Section III of said license agreement of January 1st, 1930 is hereby amended to read as follows:

The Milk Company guarantees that the royalty payable to the Licensor under the terms of this section will not be less than Dollars for each year of this license after the expiration of the calendar year 1936.

II

Except as herein expressly modified, all of the terms, conditions, and provisions of said original license agreement of January 1st, 1930, between the Foundation and the Milk Company, as modified by said other agreements, shall be and remain in full force and effect between the parties hereto.

In witness whereof the parties hereto have, by their respective duly authorized officers, set their hands hereto, and caused their respective corporate seals to be affixed the day and year first above written.

CONTRACT

Contract made and executed in duplicate by WISCONSIN ALUMNI RESEARCH FOUNDATION, a corporation not for pecuniary profit, organized and existing under and by virtue of the laws of the State of Wisconsin, having an office in Madison, Dane County, Wisconsin, and hereinafter referred to as "Foundation"; CASEIN COMPANY OF AMERICA, INC., a corporation organized and existing under and by virtue of the laws of the State of Delaware, having an office at 350 Madison Avenue, New York, N. Y., and hereinafter referred to as "Casein" and THE BORDEN COMPANY, a corporation organized and existing under and by virtue of the laws of the State of New Jersey, having an office at 350 Madison Avenue, New York, N. Y., hereinafter referred to as "Borden."

WITNESSETH: Whereas, by an instrument duly executed on December 31st, 1937, Borden acquired the business and assets of its wholly owned subsidiary, Casein, including the benefits and rights of Casein under Casein's contract with Foundation, having to do with patent rights relating to irradiation, said contract having been acquired by Casein from the Dry Milk Company, Inc., which entered into said contract with Foundation under date of January 1st, 1930, and

Whereas, CASEIN has not been or is about to be dissolved

Now, therefore, in consideration of the promises and undertakings of the parties to this contract, as hereinafter set forth, Foundation, Casein, and Borden, intending to be legally bound thereby, mutually agree as follows:

1. Casein has transferred to Borden Casein's rights and benefits under said contract and hereby confirms said transfer of said contract as of December 31st, 1937. Furthermore, Casein has delegated to Borden Casein's duties and obligations under said contract and hereby confirms said delegation as of December 31st, 1937.

2. Borden has accepted and hereby confirms its acceptance of said rights and has assumed and hereby confirms the assumption of said duties and obligations.

3. Foundation has and hereby does agree to said transfer of said rights and benefits and the delegation of said duties and obligations to Borden.

In witness whereof, Foundation has duly executed and sealed this contract at Madison, Wisconsin, on March 4th, 1938.

FRANK A. DARNULO, *Notary Public.*

This agreement made this 10th day of August 1933 between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation not for pecuniary profit (hereinafter called "Licensor"), and THE WANDER COMPANY, a corporation of the State of Delaware, having its principal office and place of business at 180 North Michigan Avenue, Chicago, Illinois (hereinafter called the "Licensee"),

WITNESSETH:

Whereas the Licensor is a corporation organized under Chapter 180, Wisconsin Statutes, to promote, encourage, and aid scientific investigation and research at the University of Wisconsin by the faculty, staff and alumni and students thereof, and those associated therewith, in providing means and machinery by which their scientific discoveries, inventions, and processes may be developed and applied and patented, and public, commercial, and humanitarian uses thereof determined and utilized, and by which such utilization or disposition may be made of such discoveries, inventions, or processes and patent rights or interest therein, as may tend to stimulate, promote, and provide funds for further scientific investigations and research within said University or departments thereof; and

Whereas the Licensor is the owner of United States Letters Patent No. 1,680,818, issued August 14th, 1928, and United States Letters Patent Nos. 1,871,136 and 1,871,135, issued August 9th, 1932, upon the applications of Harry Steenbock upon antirachitic products and processes, and also of the Steenbock pending United States patent applications Serial Nos. 290,705, filed July 5, 1928, and 611,444, filed May 14, 1932; and

Whereas the Licensee desires to secure a license under said patents and applications to practice the inventions therein described to enhance the Vitamin D potency of its product sold under the name of Ovaltine, it is agreed:

I

The Licensor grants to the Licensee a license under United States Letters Patent Nos. 1,680,818, 1,871,136, and 1,871,135, and said applications, Serial Nos. 290,705 and 611,44, together with all improvements thereon made or acquired by the Licensor during the life of this contract, to activate the product known by the trade name Ovaltine by any of the following methods:

(a) By the purchase and use of irradiated ergosterol;
(b) By direct treatment of the milk or other ingredient used in the manufacture of Ovaltine by ultraviolet rays; or
(c) By any other method of irradiation which may be hereafter mutually agreed upon.

Licensee shall keep Licensor fully informed as to the method of activation employed by it, and no method or process of activation shall be used by Licensee which shall have been disapproved in writing by the Licensor.

Direct treatment of the milk by ultraviolet rays may be used by the Licensee only in the event that it is demonstrated that by such method of activation it is possible to comply with Section XI hereof.

The word "activate" as used herein means the enhancement of Vitamin D potency by any of the above methods.

II

All irradiated ergosterol that may be used under this license shall be purchased by the Licensee from other licensees of the Licensor licensed to sell such product in the United States.

The Licensee shall have no right itself to irradiate ergosterol with ultraviolet rays, nor shall it have the right to resell or otherwise dispose of irradiated ergosterol purchased under this license except as incorporated into Ovaltine; provided,

Digitized by Google

however, that upon the termination of this license, by lapse of time or otherwise. Licensee shall have the right to dispose of any activated Ovaltine it then has on hand at the royalty rates provided for in this contract.

The two paragraphs of Section numbered II of this contract shall be deemed severable and separable covenants, and in the event of either or both being held invalid or illegal the remainder of the contract shall not be thereby affected in any way.

III

The rights of the Licensee to activate and sell the product known by the trade name Ovaltine under this license are exclusive and extend throughout the United States and its possessions and dependencies.

The Licensor retains the full right to grant other licenses for all products other than Ovaltine except as follows:

(a) The Licensor shall hereafter grant no other licenses covering the territory of this license while this license is in force to activate cocoa or chocolate-flavored food products sold in competition with Ovaltine, which contain malt extract derived from malted grain (such as chocolate malted milk and similar preparations) which are sold mixed or to be mixed with milk for the preparation of a beverage.

(b) If the Licensor grants licenses to activate any food products not chocolate or cocoa flavored which are sold in competition with Ovaltine and contain malt extract derived from malted grain and which are sold mixed, or to be mixed with milk for the preparation of a beverage (such as malted milk and similar preparations), fifty percent of all monies received thereon by the Licensor shall be paid on calendar quarters to the Licensee herein as long as this license remains in force.

The following foods shall not be considered to be sold in competition with Ovaltine, namely: Foods sold solely for infant consumption, cocoa, chocolate, tea or coffee, or milks, whether fluid, evaporated, condensed or dried. The enumeration of the above products as not being sold in competition with Ovaltine shall not be deemed to be exclusive.

IV

The duration of this license, unless otherwise terminated in accordance with the provisions of this contract, shall be for the life of United States Patent No. 1,871,136, or for the life of any other patent falling within the terms of this license, whichever is longest.

V

For the rights and privileges acquired hereunder, the Licensee shall upon the execution of this agreement pay to the Licensor a general license fee of Dollars.

VI

In addition to the general license fee provided for in Section V, the Licensee shall pay to the Licensor quarterly on the twentieth day of January, April, July, and October of each year of the life of this contract, the following royalties upon all Ovaltine sold (excluding, however, free goods and samples) during the three preceding calendar months:

------¢ per pound on the first ------ pounds of Ovaltine sold per year,
------¢ per pound on Ovaltine sold in excess of ------ pounds but less than ------ pounds per year,
------¢ per pound on Ovaltine sold in excess of ------ pounds, but less than ------ pounds per year,
------¢ per pound on Ovaltine sold in excess of ------ pounds per year.

Licensee agrees to proceed promptly and diligently with tests to establish the best medium and methods of activating Ovaltine, in which tests Licensor shall cooperate. Licensee shall go into standardized prdouction of activated Ovaltine as soon as such methods are determined. Licensee shall not be obliged to pay any royalties for the period prior to the beginning of such standardized production. It is understood that the Licensee will use every reasonable effort to go into standardized production on or before January 1, 1934.

For the period beginning with the standardized production of activated Ovaltine, and continuing until Licensee shall publicly announce to the medical profession or otherwise, the presence of the increased content of Vitamin D in Ovaltine (but in no event later than one year from the beginning of standardized production) Licensee shall pay Licensor only one-half of the royalties above provided.

Digitized by Google

It is further understood that in the event the Licensee reduces its sales price of Ovaltine (either by leaving the present Ovaltine content of its respective containers the same, but lowering the price thereof, and/or by leaving the present prices the same, but increasing the Ovaltine content in the containers) the royalties otherwise payable hereunder shall be reduced, after the date of such sales price reduction, by a percentage equal to ____ the percentage of reduction in the sales price per ounce of Ovaltine.

In the event of an increase in price and/or decrease in the Ovaltine content in the containers, the converse of the above method shall be applied to increase the Licensor's royalty.

"Standardized production" as used herein means the activation by the Licensee of substantially all Ovaltine manufactured by the Licensee.

VII

The Licensee guarantees that the royalties payable to the Licensor under Section VI hereof, will be at a rate of not less than _____ Dollars per year from the time that the Licensee goes into standardized production, as provided in Section VI hereof, until the Licensee publicly announces the presence of Vitamin D in Ovaltine (but in no event later than one year from the date that Licensee goes into standardized production).

Beginning at the date the Licensee publicly announces the presence of Vitamin D in Ovaltine (but in no event later than one year from the date that Licensee goes into standardized production) the Licensee guarantees that the royalties payable thereafter will not be less than _____ Dollars for each year that this license remains in effect. The Licensee shall, however, not be obligated to pay to the Licensor in any one year a sum in excess of _____ Dollars.

VIII

The Licensee agrees that during the existence of this license it will activate all of the Ovaltine manufactured by it in the United States after going into standardized production; provided, however, that if after going into standardized production the Licensee finds the taste or flavor of its Ovaltine is adversely affected by activation by the use of irradiated ergosterol, it shall have the right to forthwith cancel this license by notice in writing to that effect.

IX

The Licensee shall have the right to cancel this agreement as of October 1, 1936, and as of October 1 of any year thereafter by serving upon the Licensor six months' prior written notice to that effect.

X

In the event that the Licensee activates Ovaltine by the direct treatment of the milk or other ingredient used therein by ultraviolet rays, the Licensee shall not resell such milk or other ingredient or use it in any way except for the activation of Ovaltine.

XI

The Licensee shall activate its Ovaltine under this license to such degree as to give such product a sufficient Vitamin D content to be of actual practical benefit to the consumer, but not sufficiently high to enable said product to be sold as a medicine for the treatment of rickets. To this end the number of units of Vitamin D to be incorporated in each ounce of Ovaltine shall be not less than twenty Steenbock standard rat units per ounce, nor more than sixty Steenbock standard rat units per ounce.

XII

The Licensee shall not, without the approval of the Licensor, circulate any advertising material naming the Steenbock process, the Steenbock patents, the University of Wisconsin, the Licensor, or Dr. Steenbock. No extravagant or unwarranted advertising claims shall be made by the Licensee for Ovaltine activated under this agreement and specifically attributed to Vitamin D. The Licensee shall furnish the Licensor with copies of representative advertisements in connection with which representations are made as to the Vitamin D content of Ovaltine.

Digitized by Google

It is understood that for the purpose of selecting suitable advertising material in accordance with the spirit of this section, the parties will confer with one another and advertising counsel before any general advertising program relating to Vitamin E is adopted.

XIII

The Licensee shall keep at its principal office true and particular account of all Ovaltine activated and all Ovaltine sold under this license agreement. At the request of the Licensor, upon reasonable notice, such records shall be available for check and audit by the Licensor or a certified public accountant in its behalf. Such records shall be preserved for at least three years. The Licensor will regard information obtained from such records as confidential.

XIV

The Licensee shall properly comply with all statutory provisions pertaining to the marking of patented articles.

XV

The Licensor shall have the right at any time to inspect and test samples of the Licensee's activated Ovaltine and to this end the Licensee agrees to furnish the Licensor upon reasonable notice, such quantity of Ovaltine activated under this license agreement, packed ready for sale, as may be reasonably necessary for the Licensor to test the potency thereof.

XVI

The Licensor shall have the right to prosecute suits for infringement of the Letters Patent by virtue of which the Licensee is operating, and the Licensee, together with all other Licensees under said patent shall be liable for one-half of the reasonable costs of such litigation.

The Licensor shall apportion such one-half of the expenses of said patent litigation among its licensees in such a way that Licensee shall be liable only for such a proportion of the said litigation expenses as its royalties payable hereunder during the year in which such litigation expenses are incurred bear to all the royalties payable by all of the licensees for such year.

In the event of an infringement of the licensed patents by a product competing with Ovaltine, the Licensee shall notify the Licensor in writing of such infringement. If within a reasonable time after such notification, the Licensor does not undertake reasonable steps to abate such infringement, the Licensee at its own expense, and in the name of the Licensor, may sue the infringer of the patents herein licensed, and may reimburse itself for the reasonable expenses incurred or paid in such litigation (including reasonable attorney's fees) from the royalties thereafter payable hereunder. Should there be any recoveries for profits or damages in such litigation, the same shall be paid over to the Licensor, to the extent of the amount of the royalties so retained by the Licensee, the balance of such recoveries, if any, to belong to the Licensee, unless such balance shall include some damages or profits in which some other licensees would have an interest, in which event said balance shall be divided equitably with such other licensees in such a manner as shall then be agreed upon. In any such litigation brought by either of the parties hereto against infringers, the other party shall be entitled to be represented by its own counsel, at its own expense.

Should Licensee be sued for the alleged infringement of any other patent or patents, because of its use under this license of the inventions disclosed and claimed in the licensed patents, the Licensor shall defend such litigation, at its own expense, the Licensee being entitled to be represented therein by counsel of its own selection, at its own expense. Should Licensor fail or refuse to defend such patent litigation, the Licensee shall properly defend the same, and may reimburse itself for its necessary expenses therein (including reasonable attorney's fees) from royalties thereafter accruing to the Licensor under this contract, it being understood that the Licensor shall have the right to be represented in any such litigation, by counsel of its own selection, at its own expense.

It is understood that in the vent the claims of the licensed patents are held invalid, or their scope limited to such an extent as to afford little or no protection to the Licensee, by a court of competent or final jurisdiction, the Licensee shall have the right to cancel this license by written notice to the Licensor to that effect.

Digitized by Google

XVII

If the royalties or any part thereof, shall for a period of thirty days be in arrears, or in case of default by the Licensee in performing any of the agreements herein contained, the Licensor shall have in addition to all other legal or equitable remedies it may have in regard to the enforcement of this contract, the right to revoke this license by serving upon the Licensee thirty days' written notice of such arrears or such default, provided, however, that if the Licensee shall remedy or cure the default or failure because of which said cancellation notice is given, within the thirty-day period mentioned therein, the notice shall be wholly ineffective, and the license shall continue with the same force and effect as if no such cancellation notice had been given.

XVIII

The Licensee shall have no right to assign this license without the approval of the Licensor, except to a corporation controlled by the Licensee through stock ownership, or in connection with the sale of Licensee's entire business. This license shall be binding upon the successors and assigns of the Licensor.

SUPPLEMENTAL AGREEMENT

This Supplemental Agreement made this 22d day of June 1936 between the Wisconsin Alumni Research Foundation, a Wisconsin corporation, hereinafter called "Licensor," and the Wander Company, a corporation of the State of Delaware, having its principal office and place of business at 180 North Michigan Avenue, Chicago, Illinois, hereinafter called "Licensee,"

WITNESSETH:

Whereas the parties hereto entered into a certain license agreement under date of August 10, 1933, in respect of United States Letters Patent Nos. 1,680,818, 1,871,136, and 1,871,135, and also in respect of pending United States Patent applications Serial Nos. 290,705 and 611,444; and

Whereas the Licensee commenced standardized production of activated Ovaltine pursuant to the terms of said license agreement on or about January 1, 1934, and has since said date been paying royalties to the Licensor, pursuant to the terms of said license agreement; and

Whereas under the terms of said license agreement under date of August 10, 1933, the Licensee has the right of cancellation of said agreement as of October 1, 1936, by giving notice in writing prior to April 1, 1936, which date of notice has been extended by stipulation to July 1, 1936; and

Whereas the Licensor desires to have the Licensee waive such right of cancellation as of October 1, 1936, and it is agreeable to the Licensee to waive such right of cancellation; and

Whereas the parties hereto are desirous of making certain other modifications in and amendments to said license agreement of August 10, 1933, with respect to royalty rates and annual minimum guaranteed royalties thereunder:

Now, therefore, for and in consideration of the premises, it is agreed by and between the parties hereto as follows:

I

That Section VI of said agreement of August 10, 1933, is hereby amended to read as follows:

> For the period beginning January 1, 1936, and terminating September 30, 1936, the following base royalty rates shall apply upon all Ovaltine sold (excluding, however, free goods and samples):
>
> ------per pound on the first------pounds of Ovaltine sold during the nine months period January 1–September 30, 1936,

Digitized by Google

------per pound on Ovaltine sold in excess of------pounds but less than ------pounds during the said nine months period.
------per pound on Ovaltine sold in excess of------pounds but less than ------ pounds during the said nine months period,
------per pound on Ovaltine sold in excess of------pounds during the said nine months period.

Starting October 1, 1936, the following base royalty rates shall apply upon all Ovaltine sold (excluding, however, free goods and samples):

------per pound on the first ------pounds of Ovaltine sold per year,
------per pound on Ovaltine sold in excess of------pounds but less than ------pounds per year,
------per pound on Ovaltine sold in excess of------pounds per year.

The royalties calculated on the above base royalty rates from January 1, 1936, shall be reduced by ----% until such time as the sales price of Ovaltine shall be changed by altering the net prices per dozen of $------, $------, and $------ for the 6-ounce, 14-ounce, and 4-pound sizes, respectively.

It is understood that in the event the Licensee reduces its sales price of Ovaltine (either by leaving the present Ovaltine content of its respective containers the same, but lowering the price thereof, and/or by leaving the present prices the same, but increasing the Ovaltine content in the containers, and/or by increasing discounts to the trade), the royalties otherwise payable hereunder shall be reduced, after the date of such sales-price reduction, by a percentage equal to the percentage of reduction in the sales price per ounce of Ovaltine figured from a base price of $------ per pound, being the base price on which the ------% royalty reduction was figured.

In the event of an increase in price and/or decrease in the Ovaltine content in the containers, the converse of the above method shall be applied to increase the Licensor's royalty.

The Licensee shall pay royalties calculated upon the foregoing bases to the Licensor quarterly on the 20th day of January, April, July, and October of each year of the life of this contract upon all Ovaltine sold (excluding, however, free goods and samples) during the three preceding calendar months.

II

That section VII of said agreement of August 10, 1933, is hereby amended to read as follows:

The Licensee guarantees that the royalties payable hereunder will not be less than $ for the period beginning January 1, 1936, and terminating September 30, 1936, and not less than $ for each yearly period commencing October 1, 1936, that this license remains in effect. The Licensee shall, however, not be obligated to pay to the Licensor in any one year a sum in excess of $ Dollars.

III

That Section IX of said agreement of August 10, 1933, is hereby amended to read as follows:

The Licensee shall have the right to cancel this agreement as of October 1, 1937, and as of October 1 of any year thereafter by serving upon the Licensor six months' prior written notice to that effect.

In witness whereof the parties hereto have fixed their hands and corporate seals the day and year first above written.

SECOND SUPPLEMENTAL AGREEMENT

The Second Supplemental Agreement made this Fifteenth day of July 1937, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation, hereinafter called "Licensor" and THE WANDER COMPANY, a Delaware corporation, having its principal office and place of business at 360 North Michigan Avenue, Chicago, Illinois, hereinafter called "Licensee,"

WITNESSETH:

Whereas the parties hereto entered into a certain license agreement of August 10, 1933, amended by first supplemental agreement of June 22, 1925, in respect of United States Letters Patent Nos. 1,680,818, 1,871,135, 1,871,136, and 2,057,399; and

Whereas the Licensee commenced standardized production of activated Ovaltine pursuant to the terms of said license agreement as amended on or about January 1, 1934, and has since said date been paying royalties to the Licensor, pursuant to the terms of said license agreement as amended, and

Whereas under the terms of said license agreement as amended, the Licensee has the right of cancellation of said agreement as of October 1, 1937, by giving notice in writing prior to April 1937, which date of notice has been extended by stipulation of August 1, 1937, and

Whereas the Licensor desires to have the Licensee waive such right of cancellation as of October 1, 1937, and it is agreeable to the Licensee to waive such right of cancellation, and

Whereas the parties hereto are desirous of making certain modifications in and amendments to said license agreement of August 10, 1933, as amended by first supplemental agreement of June 22, 1936, with respect to royalty rates, minimum guaranteed royalties, cancellation privileges, vitamin D content of Ovaltine and the inclusion of other products thereunder.

Now, therefore, for and in consideration of the promises and the mutual agreements, it is agreed by and between the parties hereto as follows:

I

That Section VI of said agreement as amended is hereby amended to read as follows:

For the period beginning October 1, 1937, the Licensee shall pay to the Licensor quarterly on the twentieth day of April, July, October, and January of each year of the life of this contract of a cent per pound royalty on all Ovaltine sold (excluding, however, free goods and samples) during the three preceding calendar months.

II

That Section VII of said agreement as amended is hereby amended to read as follows:

The Licensee guarantees that royalties payable hereunder will be not less than dollars for the period beginning October 1, 1937, and terminating December 31, 1938, and not less than dollars for each yearly period commencing January 1, 1939, that this license agreement remains in effect. The Licensee shall, however, not be obligated to pay to the Licensor in any one year a sum in excess of dollars.

III

That Section IX of said agreement is hereby amended to read as follows:

"The Licensee shall have the right to cancel this agreement as of January 1, 1939, and as of January 1, of any year thereafter by serving upon the Licensor not less than three months' prior written notice to that effect."

IV

That Section XI of said agreement as amended is hereby amended to read as follows:

"The Licensee shall activate its Ovaltine under this license to such degree as to give such product a sufficient Vitamin D content to be of actual practical benefit to the consumer, but not sufficiently high to enable said product to be sold as a medicine for the treatment of rickets. To this end the number of units of Vitamin D to be incorporated in each ounce of Ovaltine shall be not less than 54 U. S. P. XI Vitamin D units per ounce, nor more than 270 U. S. P. XI Vitamin D units per ounce."

Digitized by Google

V

The term "Ovaltine" as used in said license agreement of August 10th, 1933, as amended, and in this Supplemental Agreement means the commercial product of the Licensee sold under its trade-mark "Ovaltine", manufactured by substantially the methods now used from the principal raw materials, barley, malt, milk, eggs and cocoa, but subject to minor quantitative variations of the above named ingredients and changes of other minor ingredients.

It is hereby stipulated and agreed that the royalty rates and other provisions of said license agreement, as amended by this Supplemental Agreement, shall apply to the Ovaltine content of any product in granular, powder, liquid or other form sold by the Licensee (excluding, however, free goods and samples). For example, such a product might be a chocolate flavored Ovaltine containing 25% to 50% Ovaltine with the addition of cocoa, sugar and other ingredients, and sold to dairies for addition to milk for distribution by dairies as a chocolate drink under a name such as "chocolate Flavored Ovaltine Drink." The royalties paid and reported on the Ovaltine content of any such product other than Ovaltine shall be included as part of the total payments in the determination of minimum and maximum royalties.

Licensee may increase the Vitamin D content of any product of the cocoa or chocolate flavored type, containing Ovaltine, to be mixed with milk as a beverage (and of no other type) above the Vitamin D contributed by the Ovaltine content of such product by the addition of Vitamin D purchased from other licensees of the Licensor. In such event Licensee shall pay an additional royalty to the Licensor calculated as though the additional Vitamin D content were contributed by additional Ovaltine; provided, however, that the amount of additional Vitamin D shall not exceed an amount which would be furnished a consumer if Ovaltine (mixed with milk and according to directions) was used instead of the product with additional Vitamin D. The royalties paid and reported as hereinabove provided shall be included as part of the total payments in the determination of minimum and maximum royalties.

The royalty rates provided on products other than Ovaltine shall be subject to adjustment and cancellation, at the option of either Licensor or Licensee on January 1st, 1939, and on January 1st of any year thereafter by either party serving upon the other not less than three months' prior written notice to such effect; provided, however, that if the Licensor and Licensee are unable to come to an agreement and the Licensor demands royalty on such products other than Ovaltine in excess of the royalty hereinabove provided, the Licensor agrees that Licensee may use Vitamin D from any source not infringing on the Licensor's patents for such products other than Ovaltine while using in Ovaltine Vitamin D purchased under said license as amended, and paying royalty on said Ovaltine.

VI

It is hereby stipulated and agreed that the reduction in royalty rates and minimum royalty effective starting October 1, 1937, shall not affect the royalty rates and minimum royalty for the period ending September 30, 1937, as provided in the license agreement as amended prior to the execution of this supplemental agreement.

In witness whereof the parties hereto have affixed their hands and corporate seals the day and year first above written.

THIRD SUPPLEMENTAL AGREEMENT

This THIRD SUPPLEMENTAL AGREEMENT made this Thirty-first day of December, 1938, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation, hereinafter called "LICENSOR", and THE WANDER COMPANY, a Delaware

Digitized by Google

corporation, having its principal office and place of business at 360 North Michigan Avenue, Chicago, Illinois, hereinafter called "Licensee,"

WITNESSETH:

Whereas the parties hereto entered into a certain license agreement under date of August 10, 1933, amended by first supplemental agreement of June 22, 1936, and by second supplemental agreement of July 15, 1937, in respect of United States Letters Patent Nos. 1,680,818; 1,871,135; 1,871,136, and 2,057,399; and

Whereas the Licensee commenced standardized production of activated Ovaltine pursuant to the terms of said license agreement on or about January 1, 1934, and has since said date been paying royalties to the Licensor, pursuant to the terms of said license agreement as amended, and

Whereas under the terms of said license agreement as amended, the Licensee has the right of cancellation of said agreement as of January 1, 1939, by giving notice in writing prior to October 1, 1938, which date of notice has been extended by stipulation to December 31, 1938, and

Whereas the Licensor desires to have the Licensee waive such right of cancellation as of January 1, 1939, and it is agreeable to the Licensee to waive such right of cancellation, and

Whereas the parties hereto are desirous of amending said license agreement of August 10, 1933, as amended by first supplemental agreement of June 22, 1936, and by second supplemental agreement of July 15, 1937,

NOW, THEREFORE, for and in consideration of the promises and the mutual agreements, it is agreed by and between the parties hereto as follows:

I

That Section VII of said agreement as amended is hereby amended to read as follows:

There shall be no minimum royalty under this license agreement for sales on and after January 1, 1939. For the five-quarter period beginning October 1, 1937, and terminating December 31, 1938, the minimum royalty is hereby reduced to Dollars. The Licensee shall, however, not be obligated to pay the Licensor in any one year a sum in excess of Dollars.

In witness whereof the parties hereto have affixed their hands and corporate seals as of the day and year first above written.

WISCONSIN ALUMNI RESEARCH FOUNDATION,

FOURTH SUPPLEMENTAL AGREEMENT

This FOURTH SUPPLEMENTAL AGREEMENT made this Fifteenth day of November, 1939, between THE WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin Corporation, hereinafter called "LICENSOR," and THE WANDER COMPANY, a Delaware corporation, having its principal office and place of business at 360 North Michigan Avenue, Chicago, Illinois, hereinafter called "Licensee",

WITNESSETH:

Whereas the parties hereto entered into a certain license agreement under date of August 10, 1933, amended by first supplemental agreement of June 22, 1936, by second supplemental agreement of July 15, 1937, and by third supplemental agreement of December 31, 1938, in respect of United States Letters Patent Nos. 1,680,818; 1,871,135; 1,871,136 and 2,057,399; and

Whereas the Licensee commenced standardized production of activated Ovaltine pursuant to the terms of said license agreement on or about January 1, 1934, and has since said date been paying royalties to the Licensor, pursuant to the terms of said license agreement as amended, and

Whereas under the terms of said license agreement as amended, the Licensee has the right of cancellation of said agreement as of January 1, 1940, by giving notice in writing prior to October 1, 1939, which date of notice has been extended by stipulation to November 15, 1939, and

Digitized by Google

Whereas the Licensor desires to have the Licensee waive such right of cancellation as of January 1, 1940, and it is agreeable to the Licensee to waive such right of cancellation, and

Whereas the parties hereto are desirous of amending said license agreement,

Now, therefore, for and in consideration of the promises and the mutual agreements, it is agreed by and between the parties hereto as follows:

I

That Section VI of said agreement as amended is hereby amended to read as follows:

"For the period beginning January 1, 1940, the Licensee shall pay to the Licensor quarterly on the twentieth day of April, July, October, and January of each year of the life of this contract ..... cents per million U. S. P. XI Vitamin D units added to Ovaltine sold (excluding, however, free goods and samples) during the three preceding calendar months."

II

It is hereby stipulated and agreed that the reduction in royalty rate effective January 1, 1940, shall not affect the royalty payable for the period ending December 31, 1939.

In witness whereof the parties hereto have affixed their hands and corporate seals as of the day and year first above written.

WISCONSIN ALUMNI RESEARCH FOUNDATION,

THE WANDER COMPANY
By (Signed) JAMES G. McMILLAN, *President.*

Attest:
[SEAL]

(Signed) E. SCHEIDENHELM, Jr.,
Secretary.

This agreement made this 15th day of July 1939, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation not for private profit (hereinafter called "the Licensor") and R. B. DAVIS COMPANY, a corporation of the State of New Jersey, having its principal office and place of business at 38 Jackson Street, Hoboken, N. J. (hereinafter called "the Licensee"),

WITNESSETH:

Whereas by agreement dated January 1, 1932, as hereafter amended by subsequent agreements between the parties hereto, the Licensor granted to the Licensee a license under United States Letters Patent No. 1,680,818, owned by the Licensor, to use the invention described in said patent for the antirachitic activation of Licensee's product sold under the name "Cocomalt," which license is still in force and effect, and

Whereas it is the desire of the parties hereto to cancel said previous agreement as heretofore amended and to substitute therefor the agreement to be hereinafter set forth.

Now, therefore, in consideration of the covenants hereinafter set forth and mutually acquiesced in by the parties hereto, it is agreed:

I

The Licensor grants to the Licensee a nonexclusive license under United States Letters Patent No. 1,680,818, to purchase and use irradiated material, as hereinafter defined, for the purpose of activating the Licensee's food beverage product now sold under the trade-mark "Cocomalt," so as to increase the antirachitic properties of the same, subject, however, to the conditions hereinafter set forth.

The phrase "irradiated material" as used in this agreement includes yeast, ergosterol and other activatable substances irradiated with ultraviolet light by the process of said Steenbock patent. All irradiated material used under this license shall be purchased by the Licensee from other licensees of the Licensor licensed to sell such products in the field covered by this license.

Digitized by Google

It is understood that the Licensee shall have no right itself to irradiate ergosterol or other activatable substances with ultraviolet light, nor shall it have the right to resell or otherwise dispose of such irradiated material except as incorporated into the licensed product.

II

The duration of this license shall be for a period of one year from the date hereof.

III

The Licensee shall have the right to sell Cocomalt activated hereunder throughout the world except in Germany.

IV

No royalties shall be payable by the Licensee to the Licensor hereunder, since by separate agreement between the Licensee and International Vitamin Corporation, distributor for Standard Brands Incorporated, it is provided that Standard Brands Incorporated shall during the period of this license pay to the Licensor royalties upon irradiated yeast supplied to the Licensee for its operations hereunder.

V

The Licensee shall not without the approval of the Licensor circulate any advertising material relating to the Steenbock process, the Steenbock patents, the University of Wisconsin, the Licensor or Dr. Steenbock. All such advertising material shall first be submitted to the Licensor for its approval, but such approval shall not be unreasonably refused or delayed.

VI

The Licensor shall have the right at any time to inspect and test samples of the Licensee's product for the purpose of determining the potency thereof.

VII

The Licensor hereby grants the Licensee options to extend the license hereinabove granted for successive periods of one year, commencing with the year beginning July 15th, 1940, provided, however, that each option herein provided for shall be exercised by the Licensee by written notice addressed to the Licensor not less than thirty days prior to the expiration date of this license, or the last renewal license, as the case may be; and provided further that prior to the commencement of the period of such renewal license the Licensee has itself agreed, or caused some other licensee of the Licensor licensed to sell irradiated material to the Licensee hereunder to agree, to pay to the Licensor during the period of such renewal license royalties (in addition to such royalties as such other licensee was obligated on January 1, 1939 to pay to the Licensor under its contract with the Licensor on irradiated material sold to the Licensee) in an amount equal, upon a per million U. S. P. Vitamin D unit basis, to those royalties payable by Standard Brands, Incorporated to the Licensor during the life of this license, pursuant to the above described agreement of June 16th, 1939, between International Vitamin Corporation and the Licensee.

VIII

The Licensee shall not assign this license, or any part of the same. This license shall bind and inure to the benefit of the parties hereto and their respective successors.

IX

Violation of any of the terms or conditions of this license by the Licensee shall constitute sufficient cause for revocation hereof by the Licensor upon 60 days' written notice.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By GEO. I. HAIGHT, *President.*

AGREEMENT

This agreement made as of the first day of March 1939, between WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin Corporation not for pecuniary profit, (hereinafter called "the Licensor") and COMMANDER-LARABEE MILLING COMPANY, a corporation of the State of Delaware, having its principal office and place of business at Minneapolis, Minn., (hereinafter called "the Licensee"),

WITNESSETH:

Whereas, the Licensor is the owner of United States Letters Patent No. 1,680,818, issued August 14th, 1928, upon the application of Harry Steenbock upon Antirachitic Product and Process, hereinafter termed "the Steenbock patent," and

Whereas, the Licensee is engaged in the manufacture of flours both for consumption in the home and for use by commercial bakers in the manufacture of bread and bread stuffs, and

Whereas, by agreements dated July 28th, 1934, as amended by subsequent agreements between the parties hereto, and October 31, 1936, the Licensor granted to the Licensee licenses under said Steenbock patent to activate its branded wheat flours intended for family use and its branded wheat flours manufactured for use by commercial bakers in the production of bread and/or bread stuffs, and

Whereas, it is the desire of the parties hereto to cancel all of said previous agreements, as heretofore amended, and to substitute therefor the agreement to be hereinafter fully set forth.

Now, therefore, in consideration of the covenants hereinafter set forth and mutually acquiesced in by the parties hereto, it is agreed:

I

The Licensor grants to the Licensee a license under United States Letters Patent No. 1,680,818, to purchase and use irradiated material, as hereinafter defined, subject to restrictions and limitations hereinafter imposed, for the purpose of enhancing the Vitamin D potency of Licensee's branded wheat flours sold for family use only, as distinguished from flours sold to commercial bakers or other commercial converters, and to sell such wheat flours; and the Licensor grants to the Licensee a license under said patent to purchase and use irradiated ergosterol, subject to restrictions and limitations hereinafter imposed, for the purpose of enhancing the Vitamin D potency of the Licensee's branded wheat flours manufactured for use by commercial bakers in the production of bread and/or breadstuffs, and to sell such branded wheat flours to such commercial bakers.

The phrase "irradiated material" as used in this agreement includes yeast, ergosterol, and other activatable substances irradiated with ultraviolet light by the process of said Steenbock patent.

All ergosterol irradiated with ultraviolet light by the process of said Steenbock patent, used under this license for the activation of flour for sale to commercial bakers, shall be purchased by the Licensee from E. I. DuPont de Nemours & Company, Wilmington, Delaware, so long as the license agreement of November 15, 1935, between the Licensor and said E. I. DuPont de Nemours & Company remains in force and effect. In the event of the termination by cancellation or otherwise of said agreement of November 15, 1935, between the Licensor and E. I. DuPont de Nemours & Company, thereafter all irradiated ergosterol used under this license for the activation of flour for sale to commercial bakers shall be purchased by the Licensee only from other licensees of the Licensor authorized to sell such product in the field covered by this license. All irradiated material used under this license for the activation of flour for family use shall be purchased by the Licensee from other licensees of the Licensor licensed to sell such products in the field covered by this license.

It is understood that the Licensee shall have no right itself to irradiate ergosterol or other activatable substances with ultraviolet light, nor shall it have the right to resell or otherwise dispose of such irradiated materials, except as incorporated in its licensed flours.

The phrase "Licensee's branded wheat flours for family use only" as used in this agreement shall mean wheat flours sold for family use only, under brand names owned by the Licensee or by subsidiary companies operating under Paragraph XVIII hereof. It is understood that this license does not contemplate the sale of flour under brands owned by the Licensee or its subsidiaries when such flour is intended to be rebranded and resold by others.

Digitized by Google

The phrase "Licensee's branded wheat flours for use by commercial bakers" as used in this agreement shall mean wheat flours sold for use by commercial bakers in the manufacture of bread and/or breadstuffs under brand names owned by the Licensee and/or by subsidiary companies operating under Paragraph XVIII hereof. It is understood that this license does not contemplate the sale of flour under brands owned by the Licensee or its subsidiaries or otherwise when such flour is intended to be rebranded and resold by others. The term "breadstuffs" as used in this license includes rolls, buns, and biscuits (excluding crackers) and the like, according to their ordinary significance to the trade in the United States.

II

The rights granted to the Licensee under this license to purchase and use irradiated material in flour for family use and to purchase and use irradiated ergosterol in commercial bakers flour, and to sell such flours, shall be exclusive during the life of this license. Such rights shall extend throughout the entire United States of America, including territories and possessions thereof so long as the latter remain under the political jurisdiction of the United States.

Nothing herein contained shall affect the rights of the E. I. DuPont de Nemours Company of Wilmington, Delaware, under its agreement with the Licensor of November 15, 1935, to sell products therein licensed to commercial bakers for incorporation in bread and/or breadstuffs, as therein defined.

III

The duration of this license, unless otherwise terminated in accordance with the provisions of this contract, shall be until August 14, 1945, the expiration date of United States Letters Patent 1,680,818.

IV

The Licensee agrees that commencing with the date hereof and thereafter during the life of this license, it will incorporate irradiated material in all flour branded "SUNFED" made and sold by it and by its subsidiary companies operating under Paragraph XVIII hereof, for family use in its entire licensed territory.

The Licensee agrees that commencing with the date hereof and thereafter during the life of this license, it will incorporate irradiated ergosterol in all flour branded "SUNFED" made and sold by it and by subsidiary companie soperating under Paragraph XVIII hereof, for use by commercial bakers in the entire licensed territory.

V

The Licensee shall incorporate into the flours treated under this license agreement such amount of irradiated ergosterol or other irradiated material as may be mutually agreed upon by the parties hereto, and as shall be sufficient to be of material aid in the prevention of rickets. It is understood that the Licensee shall make no claim for the licensed products, in advertising or otherwise, as being curative of rickets.

VI

It is understood that during the life of this contract the Licensor shall make such biological analyses of the Licensee's flours treated under this license as produced at the Licensee's plants, as the Licensor deems necessary in order to determine the antirachitic potency thereof.

VII

The Licensee agrees to pay to the Licensor during the life of this license a royalty of per barrel of pounds of wheat flour treated and shipped by the Licensee under this license and by its subsidiary companies operating under Paragraph XVIII hereof. The royalties provided for in this clause of this agreement shall be paid quarterly within 30 days from the end of each calendar quarter during the life hereof.

Digitized by Google

VIII

The Licensee guarantees that the royalties payable to the Licensor under Paragraph VII of this license shall be not less than the following amounts:

(a) for the period March 1, 1939, to and including February 28, 1940.
(b) for the period March 1, 1940, to and including February 28, 1941.
(c) for the period March 1, 1941, to and including February 28, 1942.
(d) for the period March 1, 1942, to and including February 28, 1943.
(e) for the period March 1, 1943, to and including February 28, 1944.
(f) for the period March 1, 1944, to and including February 28, 1945.
(g) for the period March 1, 1945, to and including August 14, 1945.

It is understood and agreed that the Licensee will pay to the Licensor the above minimum annual royalties in installments equivalent to $\frac{1}{12}$th of the respective annual amounts, such installments to be paid each month during the life of this license, commencing with March 1, 1939.

IX

The Licensee shall have the right to cancel this license on March 1, 1942, and at any time thereafter upon serving on the Licensor 90 days' written notice of its election so to do.

X

The Licensee agrees that sales by it of wheat flours treated pursuant to this license (other than flour for family use) shall be made only to commercial bakers for use in the manufacture of bread and/or breadstuffs, who have entered into written contracts with the Licensee relating to the use of said flour. In addition to such provisions (not inconsistent with the provisions hereinafter set forth), as the Licensee may in its discretion incorporate therein, such contracts shall contain provisions similar to the following:

(a) A provision requiring the purchaser to use such activated wheat flour only in such manner as the Licensee shall specify in such contract.
(b) A provision prohibiting the purchaser from making extravagant or unwarranted statements in advertising with respect to the Vitamin D content of products manufactured by such purchaser, in which the herein licensed activated wheat flour is incorporated, and requiring the purchaser to secure the approval of the Licensor of all advertising material relating to such products in which the Licensor's seal or insignia, the name of the Steenbock process, Dr. Steenbock, the University of Wisconsin, or the Licensor is used.
(c) A provision requiring the purchaser properly to comply with all statutory requirements regarding the marking of articles offered by him for sale and covered by the patent licensed hereunder to the Licensee.
(d) A provision granting to the purchaser an implied license under the patent herein licensed, to use the activated wheat flours purchased from the Licensee in the manufacture of bread and/or breadstuffs, such implied license to continue only so long as such purchaser complies with all of the terms of said contract.

The form and substance of the afore-mentioned provisions of such contracts, namely, subparagraphs (a) to (d), inclusive, above, shall be subject to approval by the Licensor prior to the adoption of said contracts.

The Licensee agrees to cause to be made a bioassay at a laboratory acceptable to the Licensor, at intervals of not more than four months, of a sample of the antirachitic product of each and every commercial baking plant which may use wheat flours activated hereunder and purchased from the Licensee, in the manufacture of bread or breadstuffs, and shall send a report of the result of each such bioassay to the Licensor. In the event that the bioassays of the product of any baking plant show that the Vitamin D potency of such product is below that contemplated by this license, and by said contract, then the Licensee shall use its best efforts to cause such baking plant to modify its practice in order that its product shall thereafter have the Vitamin D potency contemplated by its contract.

Digitized by Google

The Licensee agrees that in the event any purchaser of activated wheat flours sold under this license does not comply with the afore-mentioned provisions, subparagraphs (a) to (d) inclusive, of its contract, the Licensee will within sixty (60) days after receiving written notice from the Licensor setting forth in what particulars such purchaser has failed to comply with said provisions, promptly cancel its contract with said purchaser and discontinue the delivery of activated wheat flours to such purchaser, unless within such sixty (60) day period said purchaser has corrected his practices so as to comply substantially with the conditions of said provisions.

The Licensee further agrees that it will not knowingly sell, directly or indirectly, wheat flour treated under this license agreement as a source of Vitamin D for any other product whatever (except bread and breadstuffs, as herein defined) when such other product is intended to be sold or resold on a commercial basis. In case it comes to the attention of Licensee, by notice from the Licensor or otherwise, that its said wheat flour is being so used and/or sold, the Licensee will take all reasonable steps to prevent a continuance of such use and/or sale.

Nothing herein contained shall prevent the Licensee from selling licensed activated wheat flours to jobbers for resale to commercial bakers, subject to the terms and provisions of this agreement.

XI

The Licensee shall not, without the approval of the Licensor, circulate any advertising material naming the Steenbock process, the Steenbock patent, the University of Wisconsin, the Licensor, or Dr. Steenbock, or using the Licensor's seal or insignia. No extravagant or unwarranted advertising claims shall be made by the Licensee for the products covered by this agreement and specifically attributed to Vitamin D. The Licensee shall furnish the Licensor with copies of representative advertisements of the flour in connection with which representations are made as to the Vitamin D content.

It is understood for the purpose of selecting suitable advertising material in accordance with the spirit of this Section that the parties will confer with one another and advertising counsel before any general advertising program relating to Vitamin D is adopted.

XII

The Licensee shall keep at its principal office true and particular account of all flour treated and shipped under this license agreement. At the request of the Licensor, upon reasonable notice such records shall be made available for check and audit by the Licensor or a certified public accountant in its behalf. Such records shall be preserved for at least three years.

XIII

The Licensee shall properly comply with all statutory provisions pertaining to the marking of patented articles.

At the expiration of this license agreement, the Licensee shall not thereafter in its advertising or otherwise in connection with the sale of its flours, use the name of the Licensor, the name of Dr. Steenbock or the Licensor's seal or insignia.

XIV

The Licensor shall have the right at any time to inspect and test samples of the Licensee's flours treated hereunder and to this end the Licensee agrees to furnish the Licensor, upon reasonable notice, such quantity of the flour treated under this license agreement packed ready for sale, as may be reasonably necessary for the Licensor to test the potency thereof.

XV

The Licensor shall have the right to prosecute suits for infringement of the Letters Patent by virtue of which the Licensee is operating, and the Licensee, together with other licensees under said patent as may be so obligated, shall be liable for one-half of the reasonable costs of such litigation.

The Licensor shall have the right, and it shall be its duty, to apportion equitably such one-half of the expenses of litigation among other licensees bound by their contracts to bear a portion of such expenses, but the Licensee herein shall not in any event be liable for more than its pro rata portion of such expenses based

Digitized by Google

on royalties currently accruing under Paragraphs VII and VIII hereof, and in no event shall the Licensee's aggregate liability under Paragraph XV of this agreement exceed the sum of .

The Licensor agrees to send to the Licensee within sixty (60) days after the expiration of each year during the life hereof, a statement of that portion of the preceding year's expenses of litigation which the Licensee is obligated to pay hereunder, and the Licensee agrees to pay promptly said amounts for each year, respectively.

XVI

If the royalties, or any part thereof, shall for a period of thirty days be in arrears, or in case of default by the Licensee in performing any of the agreements herein contained, the Licensor shall have, in addition to all other legal and equitable remedies it may have in regard to the enforcement of this contract, the right to revoke this license by notice in writing served upon Licensee.

XVII

The Licensee shall have no right to assign this license except with the sale of substantially its entire business.

XVIII

It is agreed that the benefits of this license shall be extended to subsidiary companies percent of whose stocks are owned by the Licensee.

XIX

The Licensee agrees that commencing with the date hereof and continuing thereafter until August 14, 1945, so long as it continues to produce and sell wheat flours containing Vitamin D under the brand "Sunfed" or otherwise for family use, and flour containing Vitamin D branded "Sunfed" or otherwise for use by commercial bakers in the manufacture of Vitamin D bread and/or breadstuffs, it will operate in accordance with the terms and conditions of this agreement, and produce such Vitamin D flours hereunder.

In witness whereof the parties have by their respective duly authorized officers set their hands hereto and caused their respective corporate seals to be affixed the day and year first above written.

LICENSE AGREEMENT

This agreement made this 27th day of June 1939, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation not for private profit (hereinafter called the "Licensor"), and LOOSE-WILES BISCUIT COMPANY, a corporation of the State of New York, having its principal office and place of business at New York, N. Y. (hereinafter called the "Licensee"),

WITNESSETH:

Whereas, the Licensor is the owner of the following United States Letters Patent:

No. 1,680,818, issued Aug. 14, 1928, "Antirachitic Product and Process,"
No. 1,871,136, issued Aug. 9, 1932, "Antirachitic Product and Process,"
No. 1,871,136, issued Aug. 9, 1932, "Antirachitic Product Essence and Process,"
No. 2,057,399, issued Oct. 13, 1936, "Antirachitic Product and Process."

Whereas the Licensee desires to secure a license under said patents to fortify crackers and other products marketed by it.

Now, therefore, in consideration of the covenants hereinafter set forth and mutually acquiesced in by the parties hereto, it is agreed:

Digitized by Google

I

The Licensor grants to the Licensee a nonexclusive license under United States Letters Patent Nos. 1,680,818, 1,871,135, 1,871,136, and 2,057,399, to purchase and use irradiated material, as hereinafter defined, for the purpose of antirachitically activating the following products of the Licensee:

CRACKERS (of the various kinds now or heretofore manufactured and sold by the cracker industry in the United States) including Whole Wheat Crackers, Graham Crackers, Bran Crackers, Cheese Crackers, Wheat Meal Crackers.

WAFERS slightly sweetened such as English Style Arrowroot Wafers; also Fruited Sandwiches and Nut Sandwiches.

ROOT MACHINE BARS such as Zed,

DROP MACHINE GOODS such as Oatmeal Wafers, subject, however, to the terms and conditions hereinafter set forth.

The phrase "irradiated material" as used in this agreement means activateable substances irradiated with ultraviolet light by the process of the herein licensed patents, and first approved by the Licensor for use by the Licensee hereunder. All irradiated material used under this license shall be purchased by the Licensee from other licensees of the Licensor licensed to sell such products in the field covered by this license. The Licensee shall have no right itself to irradiate any activateable substance with ultraviolet light, nor shall it have the right to resell or otherwise dispose of irradiated material purchased hereunder except as incorporated in the licensed products.

The term "cracker" as used herein means crackers of the various kinds now or heretofore manufactured and sold by the cracker industry in the United States. It is specifically understood that this license does not embrace bread, breadstuffs, pastry, cakes, pies, doughnuts, cookies (it being understood that none of the products licensed under Section I is considered by the parties hereto as cookies) and similar products (including rolls, buns, and biscuits) according to the ordinary significance of these products as now manufactured and sold by the bread industry in the United States. It is further understood that this license does not embrace cereal breakfast foods according to their ordinary significance to the cereal trade in the United States.

II

The duration of this license shall be for the life of United States Letters Patent No. 2,057,399.

The rights granted to the Licensee hereunder shall extend throughout the world, except for Great Britain (including North Ireland and the Isle of Man) during the life of the British Steenbock Patent No. 236,197 and except for Germany during the life of the German Steenbock Patent No. 605,960.

IV

The Licensee shall have the right to cancel this license on December 31, 1940, and as of December 31 of any year thereafter by serving upon the Licensor 90 days' prior written notice by registered mail of its election so to do.

V

For the right secured under this license, the Licensee agrees either to pay the Licensor directly or to cause to be paid to the Licensor by another licensee from whom the Licensee purchases irradiated material hereunder, during the life hereof in quarterly payments within 30 days from the end of each calendar quarter, a royalty of ——— cents per million U. S. P. units of Vitamin D used by the Licensee hereunder during the preceding calendar quarter, which royalty is in addition to the royalties provided for in the licenses heretofore given by the Licensor to manufacturers and suppliers who may supply the Licensee hereunder with irradiated material.

In addition to the foregoing royalties, the Licensee shall pay to the Licensor, as compensation for the Licensor making biological analyses of the Licensee's licensed products, the sum of $——— per year during the life hereof for each separate product activated hereunder, the first of such payments to be made upon the execution of this license, and subsequent payments at annual intervals thereafter.

VI

The Licensee agrees to incorporate in each of its licensed products sufficient irradiated material to give such products a Vitamin D potency of not less than or more than 2,000 U. S. P. Vitamin D units per pound of net weight, if any such irradiated material is used therein.

Digitized by Google

VII

No extravagant or unwarranted advertising claims with reference to Vitamin D shall be made by the Licensee for products licensed hereunder The Licensee shall not, without the approval of the Licensor, circulate any advertising material referring to or naming the Steenbock patents, the University of Wisconsin, the Licensor, Dr. Steenbock or the seal or insignia of the Licensor hereinafter referred to.

VIII

The Licensee agrees to affix in a suitable manner, upon the label of each and every package which it sells of crackers activated hereunder during the life hereof, the following seal or insignia:

{Wisconsin Alumni Research Foundation, Approved for Vitamin D upon periodic tests}

provided, however, that in the event the Vitamin D potency of the Licensee's licensed products, according to tests made by or for the Licensor should fall below standards established by the Licensor hereunder (which standards shall not be in conflict with any law, ordinance or governmental regulation), the Licensee agrees that upon 90 days' prior written notice from the Licensor, it will promptly discontinue the use of such seal and not resume its use until it has complied with said standards.

It is agreed that during the life of the licenses herein granted, such use of the aforesaid seal by the Licensee shall be without the payment of any royalty or other charge therefor to the Licensor over and above the royalties stipulated in Section V of this agreement.

The Licensee shall not, without the consent of the Licensor, use the aforesaid seal or insignia, upon labels of its products or in advertising or otherwise, after the expiration of the term of the licenses herein granted.

IX

The Licensor shall have the right at any time to inspect and test samples of the Licensee's licensed products, and to this end the Licensee agrees to furnish the Licensor upon reasonable notice such quantities of such products packed ready for sale as may be necessary for the Licensor to test the potency thereof.

X

The Licensor shall have the right to prosecute suits for infringement of the licensed patents and the right to defend suits for declaratory judgments concerning such patents. The Licensee shall properly comply with all statutory provisions pertaining to the marking of patented articles.

XI

The Licensee shall keep true accounts of all irradiated material used hereunder, which accounts shall be available for audit by the Licensor at reasonable periods.

XII

The Licensee shall not assign this license without the written consent of the Licensor.

XIII

Violation of any of the terms or conditions of this license by the Licensee shall constitute sufficient cause for revocation hereof by the Licensor upon 60 days' written notice.

License Agreement For Irradiation of Fluid Milk by the Use of Ultra-Violet Rays

License granted this 25th day of April 1934 by the Wisconsin Alumni Research Foundation, of Madison, Wisconsin, a Wisconsin Corporation, not for pecuniary profit, hereinafter called the Licensor,
to Abbotts Dairies, Inc., of Philadelphia, a corporation of the State of Pennsylvania hereinafter called the Licensee.

Witnesseth:

Whereas the Licensor owns or is authorized to grant licenses under United States Letters Patent Nos. 1,680,818 and 1,817,936; and

Whereas the Licensee is desirious of securing a license under said Letters Patent to increase the antirachitic qualities of milk by the direct treatment of such milk with ultra-violet rays, it is agreed:

I. The Licensee is hereby licensed to irradiate fluid milk with ultra-violet rays so as to increase the antirachitic properties of the same under said Letters Patent Nos. 1,680,818 and 1,817,936 and under all patents the Licensor may hereafter own or acquire relating to the direct irradiation of fluid milk with ultra-violet rays. Fluid milk as used in this license means the normal lacteal secretion of the cow.

II. The duration of this license shall be for the life of all patents covered hereby, unless otherwise terminated as in this contract provided.

III. This license is in all respects nonexclusive.

IV. The Licensee's rights under this license to irradiate and sell fluid milk are limited to the following territory: Philadelphia, Pennsylvania; Camden, New Jersey; and environs.

V. The Licensee shall pay to the Licensor, beginning at the date of this contract, a license fee of Dollars per month for each month that this license remains in force.

In addition to said license fee, production royalties on fluid milk irradiated and sold under this license shall be paid to the Licensor as follows:

For fluid milk irradiated and sold in the territory of this license as specified in Section IV:

------ for each quart sold from ------ to ------ quarts per day,
------ for each quart sold from ------ to ------ quarts per day,
------ for each quart sold from ------ to ------ quarts per day,
------ for each quart sold from ------ to ------ quarts per day,
------ for each quart sold from ------ to ------ quarts per day.

The Licensee may separate cream from such irradiated milk and sell the same upon payment to the Licensor of the royalties which otherwise would accrue upon the sale of the irradiated milk from which said cream is derived. For the purpose of calculating such cream royalties, irradiated milk shall be regarded as containing 4.0% butterfat.

The license fee and production royalties for each month shall be paid within twenty days after the end of each such month.

VI. The Licensee agrees to use said process and to commence the activation of its fluid milk as soon as irradiating equipment is installed in any of the Licensee's plants, and to continue the use of said process thereafter during the life of this contract. The Licensee agrees to use all reasonable business efforts to increase the sale of its irradiated fluid milk and make a diligent and good-faith effort to increase the market demand therefor. Licensee agrees to inaugurate and carry on an educational and advertising program, the object of which will be to bring the merits of the irradiated product to the attention of the medical profession and the public. The Licensor may at its option after two years from the date the Licensee begins to irradiate its milk, terminate this license if said Licensor is not satisfied that the Licensee is diligently endeavoring to increase its sale of irradiated milk.

VII. The fluid milk irradiated and sold under this license shall contain a vitamin D content that is sufficient according to the published standards of the Licensor to prevent the development of rickets when such milk is used in a normal manner as a food product. Whenever standards are prescribed by the local Board of Health which has jurisdiction of the territory covered by this contract, the Licensee shall conform to such standards. The Licensee will equip its irradiation apparatus with automatic recording devices acceptable to the Licensor for the purpose of standardizing operating conditions.

VIII. The Licensor will make such biological analyses of Licensee's irradiated milk as the Licensor deems necessary to determine the antirachitic potency thereof.

Digitized by Google

IX. Fluid milk irradiated under this license shall be sold only as fluid milk or cream, and shall not knowingly be used, or directly or indirectly sold, as a source of vitamin D for any other product whatsoever, including all forms of milk and dairy products, when such products are intended to be sold or resold on a commercial basis.

The Licensee shall not sell the fluid milk irradiated under this license to others for resale under brands not owned by the Licensee.

X. The Licensee shall not without the approval of the Licensor circulate any advertising material relating to the Licensor, the Steenbock process, the Steenbock patents, the University of Wisconsin, or Dr. Steenbock, nor shall the Licensee make any unwarranted claims for the milk so irradiated.

XI. The Licensee shall keep true accounts of all fluid milk irradiated and all such milk sold under this license, which accounts shall be available for check and audit by the Licensor at reasonable periods.

XII. The Licensor shall have the right to prosecute suits for infringement of the licensed patents.

XIII. The Licensee may cancel this license after one year from date hereof by serving ninety days' prior written notice to that effect upon the Licensor.

XIV. The Licensee shall not assign this license without the written consent of the Licensor.

XV. This agreement and each and every term hereof shall be interpreted so as not to in any manner conflict with any provision of the National Industrial Recovery Act or of the Agricultural Adjustment Act, or with any ruling of either of the Administrations under either of said Acts, or with any provision of any Code under either of said Acts under which the Licensee now is or hereafter may be operating in its distribution of fluid milk.

XVI. In the event that the average retail selling price of the Licensee's irradiated fluid milk (except special brands) for any calendar week during the term this license is above ------ per quart, then during said week the royalties to be paid by the Licensee to the Licensor upon all fluid milk irradiated by it shall be, in place of those specified in Section V hereof, amounts per quart which will bear the same ratio to the average retail selling price during said week as the existing royalty rates bear to ------ cents.

XVII. The Licensee hereby accepts this license upon the terms and conditions herein set forth and does hereby agree to comply with all the said terms and conditions. Violation of any such terms and conditions shall constitute sufficient cause for the revocation of this license upon six days' written notice.

License Agreement for Irradiation of Fluid Milk by the Use of Ultra-Violet Rays

License granted this 15th day of November, 1939 by the Wisconsin Alumni Research Foundation, of Madison, Wisconsin, a Wisconsin Corporation, not for pecuniary profit, hereinafter called the Licensor, to Arden Farms, Inc., of Los Angeles, California, a corporation of the State of Maryland, hereinafter called the Licensee.

Witnesseth:

Whereas, the Licensor owns or is authorized to grant licenses under United States Letters Patent Nos. 1,680,818 and 1,817,936; and

Whereas, the Licensee is desirous of securing a license under said Letters Patent to increase the antirachitic qualities of milk by the direct treatment of such milk with ultra-violet rays, it is agreed:

I. The Licensee is hereby licensed to irradiate fluid milk with ultra-violet rays so as to increase the antirachitic properties of the same under said Letters Patent Nos. 1,680,818 and 1,817,936 and under all patents the Licensor may hereafter own or acquire relating to the direct irradiation of fluid milk with ultra-violet rays. Fluid milk as used in this license means the normal lacteal secretion of the cow.

II. The duration of this license shall be for the life of all patents covered hereby, unless otherwise terminated as in this contract provided.

III. This license is in all respects nonexclusive.

IV. The Licensee's rights under this license to irradiate and sell fluid milk are limited to the following territory: Los Angeles County, and the portions of Riverside and San Bernardino Counties served from Licensee's Pomona distribution plant, and the portion of Orange County served by Licensee's Santa Ana distribution plant.

V. The Licensee shall pay to the Licensor production royalties on fluid milk irradiated and sold under this license as follows:

For fluid milk irradiated and sold in the territory of this license as specified in Section IV:

_____ for each quart sold from ____ to ____ quarts per day.
_____ for each quart sold from ____ to ____ quarts per day.
_____ for each quart sold from ____ to ____ quarts per day.
_____ for each quart sold from ____ to ____ quarts per day.

The Licensee guarantees that production royalties paid to the Licensor hereunder shall be not less than _____ for each calendar month during the life of this license after the commencement by the Licensee of the sale of irradiated milk hereunder, or, in the event the Licensee has failed to commence said sale within the time specified in Section VI hereof, after the date on which the Licensee is obligated under Section VI hereof to commence said sale of irradiated milk.

The Licensee may separate cream from such irradiated milk and sell the same upon payment to the Licensor of the royalties which otherwise would accrue upon the sale of the irradiated milk from which said cream is derived. For the purpose of calculating such cream royalties, irradiated milk shall be regarded as containing 4.0% butterfat.

The production royalties for each calendar month shall be paid within twenty days after the end of each such calendar month.

VI. The Licensee agrees to proceed immediately with the installation of irradiating equipment and agrees to commence the activation of its fluid milk and sale of the same hereunder within sixty days from the date of said installation; provided, however, that in the event local and State health authorities having jurisdiction of the territory covered by this contract have not permitted the use of said process and the sale of said irradiated milk prior to the expiration of said sixty day period, then the Licensee shall not be required to commence the activation of said milk and the sale of the same until said permission is obtained.

Digitized by Google

The Licensee agrees to use all reasonable business efforts to increase the sale of its irradiated fluid milk and to make a diligent and good faith effort to increase the market demand therefor. Licensee agrees to inaugurate and carry on an educational and advertising program, the object of which will be to bring the merits of the irradiated product to the attention of the medical profession and the public. The Licensor may at its option after two years from the date the Licensee begins to irradiate its milk, terminate this license if said Licensor is not satisfied that the Licensee is diligently endeavoring to increase its sale of irradiated milk.

VII. The fluid milk irradiated and sold under this license shall contain a vitamin D content that is sufficient according to the published standards of the Licensor to prevent the development of rickets when such milk is used in a normal manner as a food product. Whenever standards are prescribed by the local Board of Health which has jurisdiction of the territory covered by this contract, the Licensee shall conform to such standards. The Licensee will equip its irradiation apparatus with automatic recording devices acceptable to the Licensor for the purpose of standardizing operating conditions.

VIII. The Licensee agrees to have made at its own expense biological assays of its irradiated milk as and in the manner prescribed by the local Board of Health having jurisdiction of the territory covered by this contract, or, in the absence of regulations of such Board of Health relating to such biological assays, as and in the manner prescribed by the Licensor; provided, however, that in no event shall there be less than four biological assays made per year of the Licensee's irradiated milk during the life of this license. The Licensor reserves the right to make at its own expense such additional biological assays of the Licensee's irradiated milk as the Licensor deems necessary.

IX. Fluid milk irradiated under this license shall be sold only in sealed containers of a maximum fluid content of one quart per container and shall be sold only as fluid milk or cream, and shall not knowingly be used, or directly or indirectly sold, as a source of vitamin D for any other product whatsoever, including all forms of milk and dairy products, when such products are intended to be sold or resold on a commercial basis.

The Licensee shall not sell the fluid milk irradiated under this license to others for resale under brands not owned by the Licensee.

X. The Licensee shall not without the approval of the Licensor circulate any advertising material of any sort whatsoever relating to milk treated under this license or relating to the Licensor, the Steenbock process, the Steenbock patents, the University of Wisconsin, or Dr. Steenbock, nor shall the Licensee make any unwarranted claims for the milk so irradiated.

XI. The Licensee shall keep true accounts of all fluid milk irradiated and all such milk sold under this license, which accounts shall be available for check and audit by the Licensor at any time.

XII. The Licensor shall have the right to prosecute suits for infringement of the licensed patents.

XIII. The Licensee may cancel this license at any time after one year from the date the Licensee commences the sale of irradiated milk hereunder, by serving ninety (90) days' prior written notice to that effect upon the Licensor.

XIV. The Licensee shall not assign this license without the written consent of the Licensor.

XV. This agreement and each and every term hereof shall be interpreted so as not to in any manner conflict with any provision of the Agricultural Adjustment Act, or with any ruling of the Administration under said Act, or with any regulation under said Act under which the Licensee now is or hereafter may be operating in its distribution of fluid milk.

XVI. In the event that the average retail selling price of the Licensee's irradiated fluid milk (except special brands) for any calendar week during the term of this license is above per quart, then during said week the royalties to be paid by the Licensee to the Licensor upon all fluid milk irradiated by it shall be, in place of those specified in Section V hereof, amounts per quart which will bear the same ratio to the average retail selling price during said week as the existing royalty rates bear to cents.

XVII. The Licensee hereby accepts this license upon the terms and conditions herein set forth and does hereby agree to comply with all the said terms and conditions. Violation of any such terms and conditions shall constitute sufficient cause for the revocation of this license upon sixty days' written notice.

License Agreement for Irradiation of Fluid Milk by the Use of Ultra-Violet Rays

License granted this 1st day of October 1935 by the Wisconsin Alumni Research Foundation, of Madison, Wisconsin, a Wisconsin Corporation, not for pecuniary profit, hereinafter called the Licensor, to Adohr Milk Farms, of Los Angeles, California, a corporation of the State of California hereinafter called the Licensee.

Witnesseth: Whereas, the Licensor owns or is authorized to grant licenses under United States Letters Patent Nos. 1680818 and 1817936; and

Whereas, the Licensee is desirous of securing a license under said Letters Patent to increase the antirachitic qualities of milk by the direct treatment of such milk with ultraviolet rays, it is agreed:

I. The Licensee is hereby licensed to irradiate fluid milk with ultraviolet rays so as to increase the antirachitic properties of the same under said Letters Patent Nos. 1680818 and 1817936 and under all patents the Licensor may hereafter own or acquire relating to the direct irradiation of fluid milk with ultraviolet rays. Fluid milk as used in this license means the normal lacteal secretion of the cow.

II. The duration of this license shall be for the life of all patents covered hereby, unless otherwise terminated as in this contract provided.

III. This license is in all respects nonexclusive.

IV. The Licensee's rights under this license to irradiate and sell fluid milk are limited to the following territory: Metropolitan Los Angeles.

V. The Licensee shall pay to the Licensor production royalties on fluid milk irradiated and sold under this license as follows:

For fluid milk irradiated and sold in the territory of this license as specified in Section IV:

____ for each quart sold from 0 to ____ quarts per day,
____ for each quart sold from ____ to ____ quarts per day,
____ for each quart sold from ____ to ____ quarts per day,
____ for each quart sold from ____ to ____ quarts per day,
____ for each quart sold from ____ to ____ quarts per day.

The Licensee guarantees that production royalties paid to the Licensor hereunder shall be not less than for each calendar month during the life of this license after the commencement by the Licensee of the sale of irradiated milk hereunder, or in the event the Licensee has failed to commence said sale within the time specified in Section VI hereof, after the date on which the Licensee is obligated under Section VI hereof to commence said sale of irradiated milk.

The Licensee may separate cream from such irradiated milk and sell the same upon payment to the Licensor of the royalties which otherwise would accrue upon the sale of the irradiated milk from which said cream is derived. For the purpose

Digitized by Google

of calculating such cream royalties, irradiated milk shall be regarded as containing 4.0% butterfat.

The production royalties for each calendar month shall be paid within twenty days after the end of each such calendar month.

VI. The Licensee agrees to proceed immediately with the installation of irradiating equipment and agrees to commence the activation of its fluid milk and sale of the same hereunder within sixty days from the date of said installation; provided, however, that in the event local and State health authorities having jurisdiction of the territory covered by this contract have not permitted the use of said process and the sale of said irradiated milk prior to the expiration of said sixty-day period, then the Licensee shall not be required to commence the activation of said milk and the sale of the same until said permission is obtained. The Licensee agrees to use all reasonable business efforts to increase the sale of its irradiated fluid milk and to make a diligent and good-faith effort to increase the market demand therefor. Licensee agrees to inaugurate and carry on an educational and advertising program, the object of which will be to bring the merits of the irradiated product to the attention of the medical profession and the public. The Licensor may at its option after two years from the date the Licensee begins to irradiate its milk, terminate this license if said Licensor is not satisfied that the Licensee is diligently endeavoring to increase its sale of irradiated milk.

VII. The fluid milk irradiated and sold under this license shall contain a vitamin D content that is sufficient according to the published standards of the Licensor to prevent the development of rickets when such milk is used in a normal manner as a food product. Whenever standards are prescribed by the local Board of Health which has jurisdiction of the territory covered by this contract, the Licensee shall conform to such standards. The Licensee will equip its irradiation apparatus with automatic recording devices acceptable to the Licensor for the purpose of standardizing operating conditions.

VIII. The Licensee agrees to have made at its own expense biological assays of its irradiated milk as and in the manner prescribed by the local Board of Health having jurisdiction of the territory covered by this contract, or, in the absence of regulations of such Board of Health relating to such biological assays, as and in the manner prescribed by the Licensor; provided, however, that in no event shall there be less than four biological assays made per year of the Licensee's irradiated milk during the life of this license. The Licensor reserves the right to make at its own expense such additional biological assays of the Licensee's irradiated milk as the Licensor deems necessary.

IX. Fluid milk irradiated under this license shall be sold only in sealed containers of a maximum fluid content of one quart per container and shall be sold only as fluid milk or cream, and shall not knowingly be used, or directly or indirectly sold, as a source of vitamin D for any other product whatsoever, including all forms of milk and dairy products, when such products are intended to be sold or resold on a commercial basis.

The Licensee shall not sell the fluid milk irradiated under this license to others for resale under brands not owned by the Licensee.

X. The Licensee shall not without the approval of the Licensor circulate any advertising material of any sort whatsoever relating to milk treated under this license or relating to the Licensor, the Steenbock process, the Steenbock patents, the University of Wisconsin, or Dr. Steenbock, nor shall the Licensee make any unwarranted claims for the milk so irradiated.

XI. The Licensee shall keep true accounts of all fluid milk irradiated and all such milk sold under this license, which accounts shall be available for check and audit by the Licensor at any time.

XII. The Licensor shall have the right to prosecute suits for infringement of the licensed patents.

XIII. The Licensee may cancel this license after one year from date hereof by serving ninety days' prior written notice to that effect upon the Licensor.

XIV. The Licensee shall not assign this license without the written consent of the Licensor.

XV. This agreement and each and every term hereof shall be interpreted so as not to in any manner conflict with any provision of the Agricultural Adjustment Act, or with any ruling of the Administration under said Act, or with any regulation under said Act under which the Licensee now is or hereafter may be operating in its distribution of fluid milk.

XVI. In the event that the average retail selling price of the Licensee's irradiated fluid milk (except special brands) for any calendar week during the term of this license is above per quart, then during said week the royalties to be paid by the Licensee to the Licensor upon all fluid milk irradiated by it shall be, in

Digitized by Google

place of those specified in Section V hereof, amounts per quart which will bear the same ratio to the average retail selling price during said week as the existing royalty rates bear to cents.

XVII. The Licensee hereby accepts this license upon the terms and conditions herein set forth and does hereby agree to comply with all the said terms and conditions. Violation of any such terms and conditions shall constitute sufficient cause for the revocation of this license upon sixty days' written notice.

LICENSEE AGREEMENT

For Irradiation of Fluid Milk by the Use of Ultraviolet Rays

License granted this 1 day of January, 1936, by the WISCONSIN ALUMNI RESEARCH FOUNDATION, of Madison, Wisconsin, a Wisconsin Corporation, not for pecuniary profit, hereinafter called the Licensor, to Annette's Dairy, of Savannah, Georgia, a partnership of the State of Georgia hereinafter called the Licensee.

WITNESSETH:

Whereas, the Licensor owns or is authorized to grant licenses under United States Letters Patent Nos. 1,680,818 and 1,817,936; and

Whereas, the Licensee is desirous of securing a license under said Letters Patent to increase the antirachitic qualities of milk by the direct treatment of such milk with ultraviolet rays, it is agreed:

I. The Licensee is hereby licensed to irradiate fluid milk with ultraviolet rays so as to increase the antirachitic properties of the same under said Letters Patent Nos. 1,680,818 and 1,817,936 and under all patents the Licensor may hereafter own or acquire relating to the direct irradiation of fluid milk with ultraviolet rays. Fluid milk as used in this license means the normal lacteal secretion of the cow.

II. The duration of this license shall be for the life of all patents covered hereby, unless otherwise terminated as in this contract provided.

III. This license is in all respects non-exclusive.

IV. The Licensee's rights under this license to irradiate and sell fluid milk are limited to the following territory: Savannah, Georgia.

V. The Licensee shall pay to the Licensor a production royalty of per quart of fluid milk irradiated and sold per day under this license in the territory specified in Section IV hereof.

Digitized by Google

The Licensee guarantees that production royalties paid to the Licensor hereunder shall be not less than for each calendar month during the life of this license after the commencement by the Licensee of the sale of irradiated milk hereunder, or, in the event the Licensee has failed to commence said sale within the time specified in Section VI hereof, after the date on which the Licensee is obligated under Section VI hereof to commence said sale of irradiated milk.

The Licensee may separate cream from such irradiated milk and sell the same upon payment to the Licensor of the royalties which otherwise would accrue upon the sale of the irradiated milk from which said cream is derived. For the purpose of calculating such cream royalties, irradiated milk shall be regarded as containing 4.0% butterfat.

The production royalties for each calendar month shall be paid within twenty days after the end of each such calendar month.

VI. The Licensee agrees to proceed immediately with the installation of irradiating equipment and agrees to commence, within sixty (60) days from the date of said installation, and to continue thereafter during the life of this license, the activation and sale of all fluid milk of all grades and price ranges, both wholesale and retail, to be distributed by the Licensee in sealed containers pursuant to Section IX hereof; provided, however, that in the event local and State health authorities having jurisdiction of the territory covered by this contract have not permitted the use of said process and the sale of said irradiated milk prior to the expiration of said sixty (60) day period, then the Licensee shall not be required to commence the activation of said milk and the sale of the same until said permission is obtained. The Licensee agrees to use all reasonable business efforts to increase the sale of its irradiated fluid milk and to make a diligent and good-faith effort to increase the market demand therefor. Licensee agrees to inaugurate and carry on an educational and advertising program, the object of which will be to bring the merits of the irradiated product to the attention of the medical profession and the public. The Licensor may at its option after two years from the date the Licensee begins to irradiate its milk, terminate this license if said Licensor is not satisfied that the Licensee is diligently endeavoring to increase its sale of irrad ated milk.

VII. The fluid milk irradiated and sold under this license shall contain a vitamin D content that is sufficient according to the published standards of the Licensor to prevent the development of rickets when such milk is used in a normal manner as a food product. Whenever standards are prescribed by the local Board of Health which has jurisdiction of the territory covered by this contract, the Licensee shall conform to such standards. The Licensee will equip its irradiation apparatus with automatic recording devices acceptable to the Licensor for the purpose of standardizing operating conditions.

VIII. The Licensee agrees to have made at its own expense biological assays of its irradiated milk as and in the manner prescribed by the local Board of Health having jurisdiction of the territory covered by this contract, or, in the absence of regulations of such Board of Health relating to such biological assays, as and in the manner prescribed by the Licensor; provided, however, that in no event shall there be less than four biological assays made per year of the Licensee's irradiated milk during the life of this license. The Licensor reserves the right to make at its own expense such additional biological assays of the Licensee's irradiated milk as the Licensor deems necessary.

IX. Fluid milk irradiated under this license shall be sold only in sealed containers of a maximum fluid content of one quart per conatiner and shall be sold only as fluid milk or cream, and shall not knowingly be used, or directly or indirectly sold, as a source of vitamin D for any other product whatsoever, including all forms of milk and dairy products, when such products are intended to be sold or resold on a commercial basis.

The Licensee shall not sell the fluid milk irradiated under this license to others for resale under brands not owned by the Licensee.

X. The Licensee shall not without the approval of the Licensor circulate any advertising material of any sort whatsoever relating to milk treated under this license or relating to the Licensor, the Steenbock process, the Steenbock patents, the University of Wisconsin, or Dr. Steenbock, nor shall the Licensee make any unwarranted claims for the milk so irradiated.

XI. The Licensee shall keep true accounts of all fluid milk irradiated and all such milk sold under this license, which accounts shall be available for check and audit by the Licensor at any time.

XII. The Licensor shall have the right to prosecute suits for infringement of the licensed patents.

Digitized by Google

XIII. The Licensee may cancel this license at any time after one year from the date the Licensee commences the sale of irradiated milk hereunder, by serving ninety (90) days' prior written notice to that effect upon the Licensor.

XIV. The Licensee shall not assign this license without the written consent of the Licensor.

XV. This agreement and each and every term hereof shall be interpreted so as not to in any manner conflict with any provision of the Agricultural Adjustment Act, or with any ruling of the Administration under said Act, or with any regulation under said Act under which the Licensee now is or hereafter may be operating in its distribution of fluid milk.

XVI. In the event that the average retail selling price of the Licensee's irradiated fluid milk (except special brands) for any calendar week during the term of this license is above per quart, then during said week the royalties to be paid by the Licensee to the Licensor upon all fluid milk irradiated by it shall be, in place of those specified in Section V hereof, amounts per quart which will bear the same ratio to the average retail selling price during said week as the existing royalty rates bear to cents.

XVII. The Licensee hereby accepts this license upon the terms and conditions herein set forth and does hereby agree to comply with all the said terms and conditions. Violation of any such terms and conditions shall constitute sufficient cause for the revocation of this license upon sixty days' written notice.

LICENSE AGREEMENT

License granted this nineteenth day of December 1939, by the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin Corporation not for pecuniary profit, hereinafter called the Licensor, to WEST HAVEN CREAMERY, INC., of West Haven, Conn., hereinafter called the Licensee,

WITNESSETH:

Whereas the Licensor is the owner of United States Letters Patent No. 1,680,818, issued August 14, 1928, relating to antirachitic products and processes, and other patents and applications for patents relating to the same;

Whereas the Licensor has granted a license to STANDARD BRANDS INCORPORATED, authorizing said company, exclusively, to activate dried yeast under said patented process, but to sell the same only to other Licensees of the Licensor, when said yeast is intended for use in the manner herein licensed;

Whereas the Licensee is desirous of securing a license under said Letters Patent to increase the antirachitic qualities of milk by the feeding of irradiated dried yeast to cows;

Now, therefore, in consideration of the premises and the sum of for each cow in a producing herd of not more than cows, the receipt whereof is hereby acknowledged, the Licensor has licensed and empowered, and by these

Digitized by Google

presents does license and empower the Licensee to purchase from STANDARD BRANDS INCORPORATED, dried yeast antirachitically activated under said Letters Patent and other patents, upon the following terms and conditions:

First: The Licensee shall buy and use such yeast for no other purpose than that of feeding cows to impart antirachitic qualities to milk.

Second: This License shall expire one year from the date hereof.

Third: The Licensee agrees to feed such irradiated dried yeast at the average daily ration shown in schedule attached hereto and made a part thereof, until such time as biological tests indicate that a different amount may be fed to impart a potency of not less than approximately 430 U. S. P. Vitamin D Units per quart of milk, and Licensee will cause to be made such biological tests as may be necessary.

The Licensee shall keep a record of all such activated yeast used and the number of cows fed and the Licensor shall have the right at any time to inspect such records, as well as the dairy, plant, or farm of the Licensee. Licensor shall also have the right to test the milk activated under this License, and the Licensee will furnish to the Licensor, upon request, free of charge, the necessary samples for this purpose.

Fourth: The Licensee shall not sell any of its antirachitically activated milk to others for use or incorporation in any other marketed product when Vitamin D or antirachitic claims are made or intended to be made for such other marketed product.

Fifth: The activated yeast purchased by Licensee pursuant to this License shall not be resold or otherwise used except for feeding the same to the Licensee's animals, pursuant to the conditions of this license.

SIXTH: The Licensee shall not without the approval of the Licensor circulate any advertising material relating to the Licensor, the Steenbock process, the Steenbock patents, and University of Wisconsin or Dr. Steenbock, nor shall Licensee make any unwarranted claims for the milk so produced.

SEVENTH: The Licensee shall not assign this License without the written consent of the Licensor.

EIGHTH: Licensee hereby accepts the said License upon the terms and conditions herein set forth and does hereby agree to comply with all the said terms and conditions. Violation of any of such terms and conditions shall constitute sufficient cause for the revocation of this license forthwith.

Dated December 19, 1939.

Expires December 18, 1940.

EXHIBIT F

NOTICES OF INFRINGEMENT

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Chicago, Ill., October 26th, 1936.

VITAMIN TECHNOLOGISTS, INCORPORATED,
1206 Maple Avenue, Los Angeles, Calif.

GENTLEMEN: It has come to our attention that you are manufacturing and selling certain irradiated Vitamin D products in the preparation of which ultra violet rays are used. Such products include products distributed under the names C. Q. Vitamin D, Condol, Condol Drops and Ray-D Irradiated Yeast Tablets.

This is to notify you that your activities in manufacturing and selling the above-referred-to preparations constitute an infringement of United States Letters Patent No. 1,680,818 of August 8th, 1928, to Harry Steenbock, No. 1,871,136 of August 9th, 1932, to Harry Steenbock and No. 2,057,399 of October 13th, 1936, to Harry Steenbock, all of which patents are owned by the Wisconsin Alumni Research Foundation.

Digitized by Google

You are requested to promptly desist from further infringement of the above-mentioned patents and to account to this Foundation for profits thus far made by you and damages thus far sustained by it as a result of your past infringement. Your failure to comply with this demand will necessitate the Foundation taking appropriate steps to fully protect its rights in the matter.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By WARD ROSS, *General Counsel.*

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Chicago, Ill., November 24, 1936.

Messrs. LYON & LYON,
811 West Seventh Street,
Los Angeles, Calif.

GENTLEMEN: Replying to your letter of November 5th, 1936, acknowledged by us under date of November 9th, 1936, the delay in replying to your letter has been occasioned by the writer's unexpectedly long absence from the city. We also wish at this time to acknowledge receipt of your telegram of November 23d in regard to this matter. We did not feel that an appropriate answer to your wire could be set forth in a telegram. Consequently, we are sorry we were unable to comply with your suggestion of wiring the position of the Foundation.

It is not clear to us from your letter of November 5th whether your advice to Vitamin Technologists, Inc. in this matter is based upon your opinion that the three Steenbock patents referred to in our letter of October 26th, 1936, to Vitamin Technologists, Inc. are invalid, or whether you also take the position that those patents are not infringed by your client's process. As you undoubtedly know, we consider the Steenbock patents above referred to are valid. In regard to the question of infringement, our information with respect to the process used by your client, or your client's licensees or customers, is that it is that process described in the campsie Patent No. 1,980,971. Our conclusion in this respect arises from the fact that the literature put out by your client and by your client's licensees or customers, as well as the labels upon their respective products, ordinarily bear reference to the above-mentioned Campsie patent, or the so-called Campsie process. It is our view that the process described in the above-mentioned Campsie patent infringes the Steenbock patents referred to in our letter of October 26th, 1936, to your client, and on the information above described, which indicated the use of that process by your client and/or its licensees or customers, infringement notices were sent to your client and certain other parties on October 26th, 1936. Therefore, upon our present understanding of these practices, our position with respect to the question of infringement remains unchanged from our views as set forth in our letter of October 26th, 1936, to your client. If our understanding is in any respect incorrect, please immediately advise us.

In your letter of November 5th you have charged this Foundation with indulging in

> "the practice of circulating promiscuously threats of legal action against the customers of Vitamin Technologists, Inc., because of the use by these customers of the material supplied them by Vitamin Technologists, Inc."

and in

> "promiscuous notification of alleged infringement and threatening court action."

The charge of unfair conduct on the part of this foundation is quite unfounded. There has in no sense been any practice of wholesale or promiscuous notices of infringement sent by this Foundation to your client or its licensees or customers.

It is true that on October 26, 1936, the date upon which we forwarded an infringement notice to your client, similar notices were sent to other concerns purporting to market products manufactured under the Campsie Patent No. 1,980,971. We assume from your letter that these other concerns are customers of your client, and that all of the irradiated preparations used by these concerns are manufactured by your client rather than by those concerns themselves. If this understanding is correct, it is the first information we have had to this effect. We certainly did not know, for example, that the National Institute of Nutrition did not manufacture its own products, such as ConDol. Its literature would

Digitized by Google

lead one to believe that these products were manufactured by National Institute of Nutrition. Consequently your belief that it is well known—

> "to the Wisconsin Alumni Research Foundation that these materials are supplied to the particular parties in question by Vitamin Technologists, Inc."—

and

> "That no one of these parties utilizes any process or processes allegedly covered by the said Steenbock patents"—

is entirely incorrect.

With respect to anything in the nature of infringement notices sent out by this foundation prior to October 26, 1936, an examination of our file has disclosed only one item which to our knowledge relates to the so-called Campsic process of cold-quartz irradiation described in the Campsie Patent No. 1,980,971. Under date of May 8, 1935, we received an inquiry from the National Institute of Nutrition as to what our position on the question of infringement would be if that concern purchased a vitamin D concentrate made by Vitamin Technologists, Inc. We replied under date of May 15, 1935, that it was our understanding that the vitamin D concentrate manufactured by Vitamin Technologists, Inc., was ergosterol irradiated by ultraviolet light, and that on that understanding we considered the use of such a concentrate by the National Institute of Nutrition would constitute an infringement of the Steenbock Patent No. 1,680,818. We still adhere to this position.

Has the National Institute of Nutrition or any of the concerns whom you represent in this matter done any marketing of any irradiated vitamin D products until lately—that is, during the year 1936—and, if so, when?

In view of the statements made in your letter to us, we think you will agree that you should arrange to permit an accredited representative of the foundation to examine into the processes conducted by your client or clients so that we may have full and accurate knowledge before deciding upon the proper course to pursue. Upon this may we have your early answer? This ought to be done, also, if you are considering favorably the institution of declaratory judgment proceedings in the United States District Court for the Western District of Wisconsin where, if at any place, jurisdiction of the subject matter resides. When we have complete knowledge of the facts (the possession of which your letter of necessity places in some doubt), we can arrange an agreeable course to settle any possible controversies in proper actions.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By WARD ROSS, *General Counsel.*

ARTICLES OF ORGANIZATION OF THE WISCONSIN ALUMNI RESEARCH FOUNDATION

ARTICLE FIRST: The undersigned have associated and do hereby associate themselves together for the purpose of forming a corporation under Chapter 180 Wisconsin Statutes.

ARTICLE SECOND: The business and purposes of the corporation shall be to promote, encourage and aid scientific investigation and research at the University of Wisconsin by the faculty, staff, alumni and students thereof, and those associated therewith, and to provide or assist in providing the means and machinery by which their scientific discoveries, inventions and processes may be developed, applied and patented, and the public and commercial uses thereof determined, and by which such utilization or disposition may be made of such discoveries, inventions and processes, and patent rights or interests therein, as may tend to stimulate and promote and provide funds for further scientific investigation and research within said University or colleges or departments thereof; and furtherance of which general purposes the corporation shall have power and authority:

1. To experiment upon, test, promote, and develop the public, scientific and commercial value of inventions, discoveries and processes;

2. To prosecute and/or aid in the prosecution of applications for patents, and obtain patents, both foreign and domestic;

3. To receive donations, gifts, bequests, or assignments of inventions, applications for patents and/or patents, both foreign and domestic, and of rights, licenses, and interests in inventions, processes, and patents, and of money or other property, and to accept the same subject to such conditions or trusts, as may be attached

Digitized by Google

thereto or imposed thereon with respect to payment of royalties, application of income or proceeds, or otherwise, and to obligate itself to perform and execute, and to perform and execute, any and all such conditions or trusts;

4. To enter into contracts or trust agreements with inventors or applicants for or owners of patents, or of patent rights, licenses, or interests, for the rendering of aid in the obtaining, perfecting, and/or maintaining of patents, both foreign and domestic, and the protection thereof, and for the testing, development, improvement, manufacture, use, and disposition of patented articles, devices, and processes, and for the disposition of the patent rights, licenses, and interests of the inventor, upon such terms and conditions, and with such provisions as to application and use of earnings and proceeds as may be agreed upon;

5. To acquire and to sell and dispose of inventions, applications for patents, and/or patents, both foreign and domestic, and interests therein, and patent rights licenses, and privileges, including territorial rights, and to grant licenses to others to manufacture, use and sell, or either, and to itself manufacture, use and sell, or either, under patents, foreign and domestic, or under licenses, rights and interests therein, and to receive, collect, and enforce collection of royalties, or other consideration, for patents, or patent rights or interests, or devices, articles or processes, of which disposition may be made or contracted for;

6. To prosecute infringements or invasion of any patent or patent right in which the corporation may be interested, and to defend against infringement, and protect, any such patent or patent right;

7. To exercise any and all powers (including the borrowing of money and securing of the same, the holding, administration and disposition of property, the making of conveyances, assignments and contracts and the incurring of obligations) which may be conferred by law or which may be necessary, incidental or convenient to the purposes above mentioned.

ARTICLE THIRD: The name of the corporation shall be Wisconsin Alumni Research Foundation, and its location shall be at the City of Madison, Dane County, Wisconsin.

ARTICLE FOURTH: The corporation shall be without capital stock, and no dividends or pecuniary profits shall be declared or paid to the members thereof.

ARTICLE FIFTH: The management and control of the corporation shall reside in a board of five trustees [1] to be elected by the members for a term of five years, all trustees after the first to be elected for the like term of five years, and all trustees to hold their offices until their respective successors are elected, vacancies, in any case, to be filled by the Trustees for the unexpired term.

The Trustees shall annually elect three officers, to wit, a President, a Vice President and a Secretary and Treasurer. Such officers shall constitute an Executive Committee, which committee shall be entitled to exercise all the powers of the Board of Trustees when not in session, but subject to the direction thereof.

ARTICLE SIXTH: The principal duties of the President shall be to preside at all meetings of the members, of the Board of Trustees, and of the Executive Committee, and to have general supervision of the affairs of the corporation.

The principal duties of the Vice President shall be to discharge the duties of the President in the event of absence or disability, for any cause whatever, of the latter.

The principal duties of the Secretary (who shall also be the Treasurer) shall be to countersign all conveyances, assignments, and contracts executed by the Corporation, affix the seal of the corporation thereto, and to such other papers as may be required or directed to be sealed, and to keep a record of the proceedings of the members, and of the Trustees, and Executive Committee, and to safely and systematically keep all books, papers, records, and documents belonging to the corporation, or pertaining to the business thereof.

The principal duties of the Treasurer (who shall also be the Secretary) shall be to keep and account for all moneys, credits, and property, of any and every nature, of the corporation, which shall come into his hands, and keep an accurate account of moneys received and disbursed, and proper vouchers for moneys disbursed, and to render such accounts, statements and inventories of moneys received and disbursed, and of money and property on hand, and generally of all matters pertaining to his office, as shall be required by the Board of Trustees.

The Board of Trustees may, from time to time, provide for the appointment of such additional officers as they may deem for the best interests of the corporation.

The officers shall perform such additional or different duties as shall from time to time be imposed or required by the Board of Trustees, or as may be prescribed from time to time by the By-Laws.

[1] Increased to six—June 1930.

Digitized by Google

ARTICLE SEVENTH: The method and conditions upon which membesr shall be accepted, discharged or expelled shall be as follows: Only graduates of the University of Wisconsin, or persons who, for period of not less than two years, have attended the University, or one or more of the schools or colleges thereof, shall be eligible for membership other than Honorary Membership.

There shall be three classes of memberships, 1) Sustaining Members, 2) Life Members and 3) Honorary Members.

Any eligible person may become a Sustaining Member upon the acceptance of his application for Membership by the signers of these Articles, or, after the election of Trustees, upon his election by them, and upon his agreement to pay an admission fee of Ten dollars. The Trustees may, from time ot time, by by-law or amendment thereto, change such admission fee, and may fix annual membership dues to be paid by Sustaining Members, and the time and terms of payment thereof. Non-payment of admission fees or dues shall be cause for termination of membership.

Any eligible person may become a Life member upon acceptance of his application by the signers of these Articles, or, after the election of Trustees, upon his election by them, and upon his agreement to pay an admission fee of One Hundred Dollars. The Trustees may, from time to time, by by-law or amendment thereto, change such admission fee, and may provide or agree on behalf of the corporation that the admission fee, or any part thereof, or any sum advanced by a member to the corporation, shall be treated as a loan by the member to the corporation, to be repaid out of net earnings applicable thereto, and under such conditions as to interest and otherwise as the Trustees may provide or as may be agreed upon with the member. Any Life Membership may be terminated by the Trustees upon the failure to make payment of the admission fee.

The Board of Trustees may, by a two-thirds vote, elect any person (irrespective of prior attendance at or connection with the University) as Honorary Member of the corporation, with or without admission fees or dues as may be provided in the bylaws.

The Trustees may, by law or amendment thereto, make such changes in the terms and conditions of membership and such regulations as regards the termination thereof, as they shall deem necessary to the welfare of the corporation.

ARTICLE EIGHTH. At any meeting of the members each member of whatever class shall be entitled to one vote in person or by written proxy, upon the election of Trustees, and upon any other question properly before the meeting. Seven members accepted by the signers of these Articles and present at the first meeting either in person or by written proxy shall be sufficient for the holding of such meeting, the election of Trustees, and the transaction of any other business properly before the meeting, and at such or any future meeting seven members, present in person or by written proxy, shall constitute a quorum for the transaction of any business of the corporation. A majority of the Board of Trustees, or of the Executive Committee, shall constitute a quorum at any meeting of the Board, or of the Committee, as the case may be.

ARTICLE NINTH: The Trustees of the corporation shall have power to make, amend and repeal bylaws and regulations for the government of the corporation, for the orderly conducting of its affairs and management of its property, for determining the manner of calling and conducting its meetings, and the manner of appointing and mode of voting by proxy, and the corporation shall have all other powers now conferred, on which hereafter may be conferred, by law, including all powers which may be necessary or convenient for the accomplishment of its purpose.

ARTICLE TENTH: Until the Trustees of the corporation shall be elected, the signers of these Articles shall have direction of the affairs of the corporation, and may make such rules as may be necessary for perfecting its organization and for accepting members.

The first meeting for the election of Trustees and officers shall be held at the _____, in the City of Madison, Dane County, Wisconsin, on the _____ day of _____ 1925, at _____ o'clock ____.

ARTICLE ELEVENTH: These articles may be amended at any meeting of the members, duly convened and held pursuant to the By-Laws, by a vote of at least one-half of the members; but no such amendment shall change substantially the original purpose of the corporation.

ARTICLE TWELFTH: In case of the dissolution of the corporation the Trustees shall make appropriate provision, by transfer in trust, or otherwise in its discretion, for applying and devoting the net assets of the corporation to the encouragement and development of scientific research in the University of Wisconsin, but any transfer or disposition of such net assets shall be made subject to

Digitized by Google

the discharge of the obligations of the corporation, and to the execution and performance of any trust under which its property or any part thereof may have been received or may be held.

ARTICLE THIRTEENTH: The names and residences of the persons forming this corporation are:

---------- residing at ----------
---------- residing at ----------
---------- residing at ----------

In witness whereof, we have hereunto set our hands this ____ day of ---------- 1925.

Signed in presence of

---------- ----------

Notary Public, Dane County, Wisconsin.

My commission expires ----------.

BYLAWS

1. The annual meeting of the members of the corporation shall be held on the second Saturday in June 1927, and annually thereafter, at the office of the Central Wisconsin Trust Company, in the city of Madison, Wisconsin. No notice of an annual meeting need be given.

2. Special meetings of the members may be held upon the call of any officer at the time and place designated in the call. Notice of any special meeting, stating the time and place, and, generally, the purpose thereof, shall be mailed to each member at his last known address at least five days prior to the meeting. A meeting may be held at any time without notice if all the members are present either in person or by written proxy. The written consent of any member to the holding of a meeting shall be equivalent to due notice to him thereof.

3. The annual meeting of the Trustees shall be held immediately following the annual meeting of the members, and at the same place. No notice of such meeting need be given.[1]

4. Special meetings of the Trustees may be held on the call of any officer upon the mailing to each Trustee, at his business or residence address, at least three days before the meeting, of a notice stating the time and place of the holding thereof. A meeting may be held at any time without notice if all the Trustees are present. The written consent of any Trustee to the holding of a meeting shall be equivalent to due notice to him thereof.

5. Any present Sustaining Member may become a Life Member upon the payment of an admission fee of $100 in lieu of his admission fee as a Sustaining Member.

6. The following is an impression of the Corporate Seal:

The Treasurer was directed to call in the unpaid admission fees of present Members.

----------,
Secretary.

VITAMIN D LICENSES—WISCONSIN ALUMNI RESEARCH FOUNDATION

Reference is made to our letter to your committee of May 19, 1939, pursuant to which you authorized the foundation to grant General Foods Corporation a license with respect to Vitamin D from nonanimal sources. The agreement the foundation made with General Foods contemplated that additional licenses would later be granted to several other firms, either licensees of General Foods or otherwise affiliated with them. Your authority did not include these additional licenses, since we preferred to wait until we learned their exact terms.

The foundation now wishes to grant a license to the William S. Merrell Co. of Cincinnati, Ohio, limited to Vitamin D from nonanimal sources for sale only as medicinals or pharmaceuticals for human use, which this department is willing to approve. It is limited to nonanimal sources in the pharmaceutical field and, therefore, we do not think it will materially interfere with our own developments. Also, the foundation is able to grant a license with respect to yeast ergosterol without our permission, since that product is not in our license field; and if the license to Merrell is limited to yeast we will not have the opportunity of selling Merrell our own irradiated ergosterol.

We do not think this is a matter requiring the approval of the finance committee.

A copy of the proposed agreement between Merrell and the foundation has been lodged with the secretary of your committee for your inspection.

Approval is therefore requested for the granting of the license to Merrell in the form of the resolution prepared by our legal department and attached hereto.

E. W. ROBINSON, *General Manager.*

JANUARY 21, 1936.

MR. CARL NIELSEN,
Director, Nutritional Research, Abbott Laboratories,
North Chicago, Ill.

DEAR MR. NIELSEN: Your courteous letter of the 9th to Dr. Waddell, in reference to a procedure to activate cholesterol, leads us to believe that our entire presentation of irradiated cholesterol to the three pharmaceutical licensees of the foundation has not been as clear as we intended it to be.

As you know, we did most, if not all of the work on irradiated cholesterol, and Dr. Waddell's paper published in 1933 threw this open to the scientific and medical world. We continued with our research program until we felt that we were about ready to get into commercial production. As you also know, we felt that irradiated cholesterol was either the true vitamin D, or a more nearly true vitamin D than irradiated ergosterol. If we were right, we felt that this new vitamin D should first go to the human field, and it was on this basis that we offered it to four pharmaceutical licensees, with the result that three indicated an active interest.

In our original presentation we tried to make it quite plain that it was our opinion that the pharmaceutical licensees of the foundation could irradiate both cholesterol and ergosterol under the terms of their respective licenses. We were, of course, largely interested in the poultry field, and to protect our position had made tentative arrangements to secure all of the available cholesterol in the country, or perhaps we might say, in the world. We offered to supply the three pharmaceutical houses with their entire requirements of irradiated cholesterol, and at the time made a very rough estimate that the cost would be two or three times as much as the cost of irradiated ergosterol. We further stated that if the pharmaceutical requirements amounted to 120,000 standard units (1 standard unit equals 1,000,000 Steenbock rat units), and the poultry field required 200,000 standard units, and we had available only 240,000 standard units, that the pharmaceutical field would get their entire requirements of 120,000 standard units and the poultry field the balance.

We realize that the pharmaceutical houses would have a preference to irradiate their own cholesterol, but in view of the limited amount of material available, and in view of our several years' experience with the material, we felt that it would be more practical and economical for the pharmaceutical houses to purchase irradiated cholesterol from us in the early stages.

Digitized by Google

We further went on record in stating that we did not have the slightest objection to selling unirradiated cholesterol to the pharmaceutical houses if we should happen to have most of the available material in our possession, and it was found that the pharmaceutical houses could do it more practically and economically than we could for them.

This whole cholesterol matter is still in a state of flux, but should the results of the clinical tests now under way verify our own opinion, it is quite likely that the pharmaceutical licensees will want "to go to market" with irradiated cholesterol next fall. We are preparing ourselves to meet this eventuality, and it would seem to the writer that it would be most "unbusiness-like" for us to disclose the results of years of research before it has been established that we cannot produce sufficient quantities of irradiated cholesterol to meet the demands of the pharmaceutical houses and to do the job more economically than the three pharmaceutical houses can individually.

In all of our discussions with pharmaceutical houses we have tried to put all our cards on the table and will continue to do so, and if we can reach a better understanding on this whole matter by personal discussion, our Mr. S. A. Atkins will be glad to do so at whatever point you designate.

Very truly yours,

KENNETH T. KING,
Manager, Fine Chemicals Division.

E. I. DU PONT DE NEMOURS & COMPANY, INC.,
Wilmington, Del., February 20, 1935.

Re: Acetol-Wisconsin Alumni Research Foundation Agreements.
J. E. KUPPERIAN.

In your letter of February 12, 1935, you requested my opinion as to whether Acetol is licensed to sell irradiated cholesterol for use in feed for cows when the effect of it would be to enhance the vitamin D content of the milk rather than to prevent rickets in the cow itself. Please be advised that Acetol's agreement with the Foundation permits it to manufacture antirachitic products from certain sources, one of which is cholesterol, and to sell such products to various defined classes of purchasers. In the case of feed for cows, there is no restriction whatsoever, upon the class of purchasers. Irradiated cholesterol may, therefore, be used in feed for cows regardless of whether its purpose is to enhance the vitamin D content of the milk or to prevent rickets in the cow itself.

In this connection a further question arises which must be answered by Dr. Waddell. The original contract of November 1929 stated that the vitamin D potency of animal feeds must not exceed five times that of standard cod liver oil. This particular provision was amended by the supplemental agreement of November 1930 in such manner that it permitted the vitamin D potency of animal feeds to be "sufficient to prevent rachitic conditions in domestic animals * * *." A fair interpretation of the agreement as amended would construe the word "sufficient" as placing a maximum limitation upon the vitamin D potency of animal feeds.

Since irradiated cholesterol is much more potent in its antirachitic effects upon the human body than the number of rat units contained therein would suggest, it is quite possible that we will not have to exceed the maximum limits set out in the contract, i. e., an amount sufficient to prevent rachitic conditions in domestic animals. If Dr. Waddell is, however, of the opinion that an appreciably greater amount is necessary to enhance the vitamin D content of the cow's milk we should adhere to the directions set out in the agreement and formally request the foundation to approve the use of a greater potency. The foundation has stated that it will readily consent to change any potency if not incompatible with its policy with respect to other licenses.

If there is any further information or help which you need in this matter please do not hesitate to call upon me.

ARTHUR G. CONNOLLY.

SUPPLEMENTAL AGREEMENT

This supplemental agreement made this First day of February 1939, between the Wisconsin Alumni Research Foundation, a Wisconsin corporation, not for pecuniary profit (hereinafter called the Foundation), and Standard Brands

Digitized by Google

Incorporated, a corporation organized and existing under and by virtue of the laws of the State of Delaware (hereinafter called the Company).

WITNESSETH:

That Whereas the Foundation and The Fleischmann Company, an Ohio corporation, did on August 8th, 1928, enter into a certain license contract whereby the Foundation granted certain rights and licenses to said The Fleischmann Company to use the invention described in application for Patent No. 723,171, filed June 30th, 1924, and Patent No. 1,680,818, issued thereon, also any other patents affecting this invention; and

Whereas the rights and licenses of The Fleischmann Company under said contract have been with the consent of the Foundation, duly assigned to the Company; and

Whereas said agreement of August 8, 1928, has heretofore been amended by various Supplemental Agreements and letter agreements: and

Whereas the Company has an option to renew said license as of the date of this Supplemental Agreement and desires to renew the same upon certain modified terms and conditions; and

Whereas it is agreeable to the Foundation that said license be renewed upon the modified basis hereinafter set forth.

Now, therefore, it is agreed:

I

The Company agrees to pay to the Foundation in full payment for the licenses herein granted the following sums: ($12,500.00) Twelve Thousand Five Hundred Dollars upon the execution of this agreement, the receipt of which is hereby acknowledged by the Foundation: Twelve Thousand Five Hundred ($12,500.00) Dollars on August 1, 1939, and Twelve Thousand Five Hundred ($12,500.00) Dollars semiannually thereafter through August 1, 1944; and Thirteen Thousand Five Hundred ($13,500.00) Dollars on February 1, 1945.

The Foundation hereby grants the Company options to extend the licenses hereinabove granted for successive periods of one year, commencing with the year beginning August 15, 1945. Each option herein provided for shall be exercised by the Company by written notice addressed to the Foundation and deposited in the registered mail not less than thirty days prior to the expiration date of this license, or of the last renewal license, as the case may be. Each such renewal license shall be upon the same terms and conditions as this license except that the amount payable by the Company to the Foundation as full royalty for each one year renewal license shall be $25,000.00 Dollars payable semiannually.

II

The Foundation agrees to waive payment by the Company of the royalty (now provided for in Section I of the Supplemental Agreement of April 4, 1932, between the parties hereto) of per pound for licensed activated yeast products except foil yeast sold by the Company, on all sales of such activated yeast products made by the Company at any time after February 1, 1939, and thereafter during the life of this license and any renewal or renewals thereof.

III

The Company agrees that during the life of this license and any renewal thereof it will not directly or indirectly manufacture for sale, sell, or offer for sale any licensed activated yeast or yeast product or products to any person, firm, or corporation for incorporation in or addition to milk products from which a substantial quantity of the water has been removed, including evaporated, condensed, and "filled" milks (not including, however, chocolate- and cocoa-flavored food products not containing malt or malt extract derived from malted grain, which are sold mixed or to be mixed with milk for the preparation of a beverage), unless said person, firm, or corporation is expressly licensed by the Foundation to purchase such licensed activated yeast or yeast product or products from the Company and to incorporate the same in or add the same to such milk products. The Company further agrees that during the life of this license and any renewal thereof it will not directly or indirectly incorporate any licensed activated yeast or yeast product or products in or add the same to any such milk product.

The term "filled milk" as used in this Supplemental Agreement means any milk, cream, or skimmed milk, whether or not condesned, evaporated, concentrated, powdered, dried, or desiccated, to which has been added, or which has

Digitized by Google

been blended or compounded with any fat or oil other than milk fat, so that the resulting product is in imitation or sembalance of milk, cream, or skimmed milk, whether or not condensed, evaporated, concentrated, powdered, dried, or desiccated.

IV

The Company agrees that during the life of this license and any renewal thereof it will supply to the Foundation licensed activated ergosterol for resale by the Foundation in the form of a Vitamin D concentrate to its licensees or customers for direct addition to fluid milk by such licensees or customers. The Company agrees that it will supply such licensed activated ergosterol at a price not in excess of prices which the Company is then obtaining for licensed activated ergosterol sold for other purposes and in no event shall such price be in excess of the then prevailing market price for irradiated ergosterol.

V

There has heretofore been a dispute between the parties as to whether under said agreement of August 8, 1928, as heretofore amended, the Company has the right to sell licensed activated dry yeast for direct addition to or incorporation in fluid milk, to persons, firms, or corporations not licensed by the Foundation to incorporate such product in fluid milk. It is now agreed by the parties that commencing February 1, 1939, and continuing thereafter during the life of this license and any renewal thereof, the Company shall have the right to sell licensed activated dry yeast or licensed activated ergosterol (both of which products are hereinafter included in the expression "Vitamin D concentrate") for direct addition to or incorporation in fluid milk to any person, firm; or corporation, subject to the following terms and conditions:

(a) The Foundation shall have the right to establish minimum net prices for Vitamin D concentrate sold by the Company for direct addition to fluid milk, and the Company agrees to abide by and observe such minimum net prices. In the event that the Company wishes to market any such products hereunder, upon request from the Company the Foundation shall notify the Company of the minimum net prices it desires to establish. The Foundation shall have the right to modify such prices at any time by written notice to the Company 30 days prior to the effective date of any such modification. Such minimum net prices established by the Foundation shall in no event be in excess, on a per million U. S. P. Vitamin D unit basis, of the minimum net prices then being charged by the Foundation for Vitamin D concentrate sold by it for direct addition to fluid milk.

(b) No free goods of any kind or any other inducements are to be offered by the Company the effect or tendency of which would be to lower the minimum prices established by the Foundation.

(c) The Company [Standard Brands] agrees that during the life of this license and any renewal thereof it will not, without the written consent of the Foundation, directly or indirectly manufacture for sale, sell or offer for sale any Vitamin D concentrate to any person, firm, or corporation for incorporation in or addition to fluid milk which person, firm, or corporation has within three months prior thereto either been authorized by license by the Foundation to irradiate fluid milk directly with ultra violet rays under any of the patents herein licensed, and has been substantially operating under such license, or has purchased from the Foundation a Vitamin D concentrate for direct addition to or incorporation in fluid milk.

(d) The Company agrees that during the life of this license and any renewal thereof it will not directly or indirectly manufacture for sale, sell, or offer for sale any Vitamin D concentrate for direct addition to or incorporation in fluid milk to any person, firm, or corporation which has not previously been licensed by the Foundation under a form of license agreement mutually agreed upon by the parties hereto. Such license form shall not provide for the payment by the licensee thereunder to the Foundation of royalties or any other monies. The terms of such license shall not be less favorable to the licensee thereunder than any form of license then being used by the Foundation in connection with the sale of its Vitamin D concentrate for such use. The Foundation agrees that it will promptly issue a license in the form agreed upon to any and all milk producers and distributors designated by the Company whenever requested by the Company to do so.

Digitized by Google

VI

The Company agrees for a period of two years from February 1, 1939, to waive its rights under Paragraph V of this Supplemental Agreement to sell Vitamin D concentrate for direct addition to fluid milk, upon the following terms and conditions:

(a) The Foundation agrees to pay to the Company during the period hereinafter defined semiannually a sum equivalent to 40% of the net profits of the Foundation, as hereinafter defined, derived by the Foundation from the sale by it of Vitamin D concentrate for direct addition to fluid milk to (1) persons, firms, and corporations previously licensed by the Foundation to use licensed activated yeast as a part of the ration of cows in the production of Vitamin D milk and whose licenses have expired not more than six months prior to the commencement of such sales and (2) persons, firms, and corporations not prior to the commencement of purchases of Vitamin D concentrate from the Foundation for direct addition to fluid milk, licensed by the Foundation to irradiate fluid milk with ultraviolet rays directly or not having previously purchased such Vitamin D concentrate from the Foundation, and which persons, firms, and corporations are secured as customers for the Foundation's Vitamin D concentrate directly and primarily as a result of the Company's soliciting efforts.

(b) The obligation of the Foundation to make the payments provided for in Section VI (a) hereof shall continue only for a period of two years from February 1, 1939, and thereafter so long as the Company continues to waive its right under this Supplemental Agreement to sell Vitamin D concentrate for direct addition to fluid milk and in no event shall such obligation continue beyond the expiration of the licenses herein granted and any renewals thereof.

(c) The term "net profits" as used in this agreement means the gross sales of Vitamin D concentrate by the Foundation to the buyers thereof hereinbefore mentioned less the cost of manufacture of such Vitamin D concentrate and less a sum per year per milk route of each such buyer representing the Foundation's average cost of service per year per milk route of all licenses of the Foundation for the production of Vitamin D milk, and in no event shall such sum be greater than $10.00 per year per milk route. For the purpose of these determinations the cost of manufacture of such Vitamin D concentrate shall include only the cost of ingredients, labels, and cans used, the cost of processing and packing and labor involved therein, rent, and depreciation on equipment employed therein. Net profits shall be calculated separately for each of said buyers of Vitamin D concentrate.

VII

On February 1, 1941, and on February 1 of each succeeding year during the life of this license and any renewal thereof, the Company shall have the option of continuing said waiver of its right to sell Vitamin D concentrate for direct addition to fluid milk for additional successive periods of one year. Such option shall be exercised by written notice from the Company to the Foundation not less than 30 days prior to February 1, 1941, or prior to the expiration of the last expiring one-year period, as the case may be.

It is understood by the parties that should the Company elect to sell a Vitamin D concentrate for direct addition to fluid milk it will endeavor in good faith to make an arrangement under which the Foundation through its existing organization will service the Company's customers for such Vitamin D concentrate in the promotion of sales of Vitamin D milk.

VIII

The Foundation agrees that during the life of this license and any renewal thereof, it will not, without the written consent of the Company, directly or indirectly manufacture for sale, sell, or offer for sale any Vitamin D in any concentrated form to any person, firm, or corporation for incorporation in or addition to fluid milk which person, firm, or corporation has within three months prior thereto been operating under a license issued by the Foundation to use activated yeast as a part of the ration of cows in the production of Vitamin D milk.

Digitized by Google

IX

It is understood and agreed that in the event of a final and determinative decree by a United States Circuit Court of Appeals or by a United States District Court from which no appeal is taken, adjudging the claims of the Foundation patents which cover the licensed operations of the Company to be ineffective to protect the Company's operations under the Licenses granted to it, then the Company shall have the right to terminate this agreement and all obligations thereunder.

X

All provisions of the contract of August 8, 1928, between the parties hereto, as amended by said Supplemental Agreements and letter agreements, shall remain unaltered except as modified by this agreement.

IN WITNESS Whereof the parties hereto have hereunto affixed their corporate seals and caused these presents to be signed, the Wisconsin Alumni Research Foundation by its officers, and Standard Brands Incorporated, by its officers, thereunto duly authorized by their respective Board of Directors.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By GEO. I. HAIGHT, *President.*
Attest: TIMOTHY BROWN, *Asst. Secretary.*
STANDARD BRANDS INCORPORATED,
By THOMAS L. SMITH, *President.*
Attest: HUGO A. OSWALD, *Secretary.*

STANDARD BRANDS, INC.,
New York, N. Y., July 19, 1938.

Mr. WARD ROSS,
General Counsel, Wisconsin Alumni Research Foundation,
Chicago, Ill.

DEAR MR. ROSS: Many thanks for your letter of July 15, 1938, extending the time for exercising our option to renew the license agreement until January 31, 1939.

It is understood and agreed that we will not during the extended period to January 31, 1939, offer for sale any activated yeast product for direct addition to milks, either fluid or evaporated. We also agree that during this period that we will supply the foundation with irradiated ergosterol for direct addition to milks by licensees of the foundation.

A check for the license for the 6-month period beginning August 1, 1938, and ending January 31, 1939, for $12,500 will be sent to the foundation within the next few days.

I am quite hopeful that during the extended period this matter will be concluded one way or another, and that it will not be necessary for me to ask for any additional extension of time.

It was indeed a pleasure to have met both Dr. Russell and you, and I likewise anticipate looking forward to further pleasant relations with you.

Very truly yours,

R. L. FRUCHTERMAN.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Chicago, Ill., August 3, 1938.

Mr. R. L. FRUCHTERMAN,
Standard Brands, Inc., New York City, N. Y.

DEAR MR. FRUCHTERMAN: Thanks for your letter of July 19 which arrived during my absence from the city.

The arrangement you set forth is in full accord with our letter of July 15, and accordingly we shall consider the matter temporarily taken care of.

As indicated in our letter of July 15, we shall look forward to hearing from you just as soon as you are able to give this matter consideration.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By ——— ———, *General Counsel.*

Digitized by Google

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Chicago, Ill., July 15, 1938.

Mr. R. L. FRUCHTERMAN,
Legal Department, Standard Brands, Inc.,
New York City, N. Y.

DEAR MR. FRUCHTERMAN: With reference to our recent conversation over long-distance telephone, and to our personal conference in New York on July 11, 1938, I am now authorized to state that in view of the situation in which you find yourself as a result of the untimely death of Mr. Arthur Ritter, and the heavy burden falling upon your shoulders, the Foundation is willing to extend the time within which Standard Brands has the right to exercise its option to renew its license agreement with the Foundation, under the Steenbock patents, from July 31, 1938, to January 31, 1939.

This extension is granted and agreed to by the Foundation upon the understanding that Standard Brands will not during this extension period to January 31, 1939, offer for sale any activated yeast product for direct addition to milks, either fluid or evaporated, and with the further understanding that during this period Standard Brands will supply to the Foundation irradiated ergosterol for direct addition to milks by licensees of the Foundation.

We will appreciate your confirming the above understanding by letter.

As indicated above, we, of course, realize the load which you will have to carry as a result of having to take over Mr. Ritter's work. It is, however, our very definite desire to come to some definite understanding with Standard Brands in regard to this matter just as soon as possible. As we mentioned to you in our personal conference, the Foundation has made a specific proposal to Standard Brands under which the license would be put upon a year-to-year basis if Standard Brands would agree to waive certain alleged rights thereunder. This proposal was made first in our letter to Mr. Ritter of May 29, 1937, and substantially the same proposal was reiterated in our letter of September 25, 1937.

It has now been approximately fourteen months since this suggestion was originally placed before your company. We believe that we are entitled to an answer to that suggestion and that it is not unreasonable for us to expect a definite answer prior to the termination of the six months' extension period dealt with in this letter.

Both Dr. Russell and I enjoyed meeting you in New York and are looking forward to further pleasant relations with you.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By ——— ———, *General Counsel.*

SUPPLEMENTAL AGREEMENT

This Supplemental Agreement made this 20th day of February 1936, between the Wisconsin Alumni Research Foundation, a Wisconsin corporation, not for pecuniary profit (hereinafter called the Foundation) and Standard Brands, Incorporated, a corporation organized and existing under and by virtue of the laws of the State of Delaware (hereinafter called the Company),

WITNESSETH:

That, Whereas, the Foundation, and the Fleischmann Company, an Ohio corporation, did on August 8th, 1928, enter into a certain license contract whereby the Foundation granted certain rights and licenses to said The Fleischmann Company to use the invention described in application for patent No. 723,171, filed June 30th, 1924, and Patent No. 1,680,818, issued thereon, also any other patents affecting this invention, and

Whereas the rights and licenses of The Fleischmann Company under said contract have been with the consent of the Foundation, duly assigned to the Company, and

Whereas said agreement of August 8, 1928, has heretofore been amended by various Supplemental Agreements and letter agreements, and

Whereas a doubt has arisen in the minds of the parties thereto regarding the date upon which Standard Brands, Incorporated, may exercise its second option to extend the licenses granted in said agreement, for the balance of the full term and life of any United States Letters Patent of the Foundation therein licensed, pursuant to Section IX of said Agreement of August 8th, 1928, as amended, and

Digitized by Google

Whereas it is the desire of the parties hereto to resolve said doubt by definitely fixing the date prior to which said option must be exercised,

Now, therefore, it is agreed as follows:

I

The right of Standard Brands, Incorporated, to exercise the renewal option contained in Section IX of said contract of August 8, 1928, for the balance of the full term and life of any United States Letters Patent of the Foundation referred to in said contract of August 8, 1928, shall expire upon July 31, 1937.

II

All other provisions of the contract of August 8, 1928, between the parties hereto, as amended by said Supplemental Agreement and letter agreements, shall remain unaltered except as expressly modified by this agreement.

In witness whereof the parties hereto have hereunto affixed their corporate seals and caused these presents to be signed, the Wisconsin Alumni Research Foundation, by its officers, and Standard Brands, Incorporated by its officers, thereunto duly authorized by their respective Boards of Directors.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis., December 19, 1935.

STANDARD BRANDS, INC.,
New York City.

GENTLEMEN: This letter is in confirmation of the understanding arrived at in our conference with your representatives at your office yesterday. You have represented to us that you are undertaking a sales campaign during 1936 on activated yeast for cow feeding involving an additional expenditure on your part, over 1935, of approximately $50,000. You have requested that, in consideration of your undertaking this campaign, the foundation waive certain royalty payments that may become due from you to the foundation during the year 1936 under our agreement of August 8, 1928, as amended, and during the year 1937 until the termination of that agreement on July 31, 1937.

We propose the following modifications of the existing license agreement of August 8, 1928, as amended, between the foundation and Standard Brands, Inc.

1. The foundation agrees to waive the payment by Standard Brands, Inc., of the 2-cent-per-pound royalty that may become due to the foundation pursuant to section II A7 of said agreement of August 8, 1928, as amended, on sales of activated yeast products in excess of 800,000 pounds during the 19-month period commencing January 1, 1936, and ending July 31, 1937, made by Standard Brands, Inc., to milk producers licensed by the foundation to feed such activated yeast products to cows for the production of antirachitic milk.

2. Standard Brands, Inc. agrees that it will in good faith not endeavor during the last portion of said period from January 1, 1936, to August 1, 1937, by sales campaigns, price reductions or otherwise, to anticipate the requirements of milk producers licensed by the foundation to purchase and feed activated yeast products to cows, by selling, directly or indirectly, amounts to such licensees, which are, considering the usual requirements of such licensees, in excess of the customary amounts purchased to satisfy such requirements.

3. Standard Brands, Inc., agrees from the date hereof until the expiration of said agreement of August 8, 1928, as amended, namely upon July 31, 1937, that it will not directly or indirectly manufacture for sale, sell or offer for sale any activated yeast product or products to any evaporated or condensed milk producer or to any other person, for incorporation in or addition to evaporated or condensed milks.

Digitized by Google

4. It is mutually agreed that nothing in this letter agreement shall in any way enlarge or expand the rights of Standard Brands, Inc., under said agreement of August 8, 1928, as amended, to sell activated yeast products in any field or fields and/or for any purpose or purposes other than those provided for in said agreement of August 8, 1928, as amended; it being understood that nothing contained in this letter agreement shall be construed as constituting an admission on the part of the foundation that Standard Brands, Inc., under its license agreement of August 8, 1928, as amended, has any rights to sell activated yeast products for addition to or incorporation in evaporated or condensed milks. If this agreement is satisfactory to you, please indicate your acceptance thereto by your signature at the foot of this letter, and return one copy to us.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By H. L. RUSSELL, *Director.*

Accepted.

By A. C. LEMKAU.

STANDARD BRANDS INC.,
New York, N. Y., April 29, 1932.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis.

GENTLEMEN: As you are aware, the license term of our agreement dated August 8, 1928, was duly extended to August 1, 1932, and payments made covering such extended period pending the disposition of litigation between us. That litigation having now been disposed of, we hereby notify you that this company desires to, and hereby does, exercise its option to extend the licenses granted in said agreement of August 8, 1928, pursuant to section IX therein, for an additional term of 5 years from August 1, 1931, up to and including the 31st day of July 1936.

Your confirmation will be appreciated.

Very truly yours,

HUGO A. OSWALD, *Secretary-Treasurer.*

License granted this day of by the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation not for pecuniary profit, hereinafter called the Licensor, to of hereinafter called the Licensee,

WITNESSETH:

Whereas, the Licensor is the owner of United States Letters Patent No. 1,680,818, issued August 14, 1928, relating to antirachitic products and processes, and other patents and applications for patents relating to the same;

Whereas, the Licensor has granted a license to STANDARD BRANDS INCORPORATED, authorizing said Company, exclusively, to activate dried yeast under said patented process, but to sell the same only to other licensees of the Licensor, when said yeast is intended for use in the manner herein licensed;

Whereas, the Licensee is desirous of securing a license under said Letters Patent to increase the antirachitic qualities of milk by the feeding of irradiated dried yeast to cows;

Now, therefore, in consideration of the premises and the sum of for each cow in a producing herd of not more than cows, the receipt whereof is hereby acknowledged, the Licensor has licensed and empowered, and by these presents does license and empower the Licensee to purchase from STANDARD BRANDS INCORPORATED, dried yeast antirachitically activated under said Letters Patent and other patents, upon the following terms and conditions:

FIRST: The Licensee shall buy and use such yeast for no other purpose than that of feeding cows to impart antirachitic qualities to milk.

SECOND: This License shall expire one year from the date hereof.

THIRD: The Licensee agrees to feed such irradiated dried yeast at the average daily ration of not less than ten (10) ounces per cow until such time as biological tests indicate that a different amount may be fed to impart a potency of not less than approximately 160 Steenbock Units per quart of milk, and Licensee will cause to be made such biological tests as may be necessary.

The Licensee shall keep a record of all such activated yeast used and the number of cows fed, and the Licensor shall have the right at any time to inspect such

Digitized by Google

records, as well as the dairy, plant, or farm of the Licensee. Licensor shall also have the right to test the milk activated under this License, and the Licensee will furnish to the Licensor, upon request, free of charge, the necessary samples for this purpose.

FOURTH: The Licensee shall not sell any of its antirachitically activated milk to others for use or incorporation in any other marketed product when Vitamin D or antirachitic claims are made or intended to be made for such other marketed product.

FIFTH: The activated yeast purchased by Licensee pursuant to this License shall not be resold or otherwise used except for feeding the same to the Licensee's animals, pursuant to the conditions of this license.

SIXTH: The Licensee shall not without the approval of the Licensor circulate any advertising material relating to the Licensor, the Steenbock process, the Steenbock patents, the University of Wisconsin or Dr. Steenbock, nor shall Licensee make any unwarranted claims for the milk so produced.

SEVENTH: The Licensee shall not assign this license without the written consent of the Licensor.

EIGHTH: Licensee hereby accepts the said License upon the terms and conditions herein set forth and does hereby agree to comply with all the said terms and conditions. Violation of any of such terms and conditions shall constitute sufficient cause for the revocation of this license forthwith.

SUPPLEMENTAL AGREEMENT

This agreement made this 4th day of April 1932, between the WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation not for pecuniary profit (hereinafter called the FOUNDATION) and STANDARD BRANDS INCORPORATED, a corporation organized and existing under and by virtue of the laws of the State of Delaware (hereinafter called the COMPANY),

WITNESSETH:

That, whereas, the FOUNDATION and the Fleischmann Company, an Ohio corporation, did on August 8, 1928, enter into a certain license contract whereby the FOUNDATION granted certain rights and licenses to said The Fleischmann Company to use the invention described in Application for Patent No. 723,171, filed June 30, 1924, and Patent Number 1,680,818 issued thereon, also any other patents affecting this invention, and

Whereas, the rights and licenses of The Fleischmann Company under said contract have been with the consent of the FOUNDATION, duly assigned to the COMPANY, and

Whereas, there is now pending on appeal in the Supreme Court of the State of Wisconsin, a suit instituted by the COMPANY against the FOUNDATION, to secure a judicial interpretation in regard to the rights of said COMPANY under said contract to sell the activated yeast products therein licensed, and

Whereas, the FOUNDATION and the COMPANY are desirous of composing their differences without further legal proceedings by entering into a Supplemental Contract amending said license contract of August 8, 1928;

Now, therefore, it is agreed as follows:

I

That Section II, Paragraph A of said license contract be amended to read as follows:

A—The exclusive right and license to manufacture, use and sell throughout the United States and Canada, antirachitically activated Foil Yeast, Dried Yeast, Autolyzed Yeast, Hydrolyzed Yeast, and like yeast products, whether antirachitically activated in bulk (directly) or by incorporation therein of separately antirachitically activated substance (indirectly) subject, however, to the following terms, conditions and agreements:

Digitized by Google

1. If such yeast products are to be activated indirectly they shall not be activated to a potency in excess of that obtainable by direct irradiation.

2. None of such yeast products shall be used by the COMPANY or sold to others than licensees of the FOUNDATION for use in a field or fields in which the FOUNDATION has prior to the date hereof issued a license or licenses, except as hereinafter provided. (A list of such licensees and the respective fields covered by such licenses is hereto attached, marked Exhibit "A".)

3. Nothing herein contained shall prevent the COMPANY from selling such activated yeast products without restriction in the feed fields for stock, poultry, animals and birds, nor shall anything herein contained prevent the COMPANY from selling its activated foil yeast without restriction as heretofore.

4. The COMPANY shall not use or sell such activated yeast products for incorporation in the following products, viz: margarines, cosmetics, bottled soft drinks, chewing gum, flour and cheese.

5. For all purposes and in all fields other than those hereinabove in subparagraphs 2 and 4 set forth (except the natural liquid milk field, as hereinafter set forth) the COMPANY has the right to sell and use such activated yeast products without restriction, but it shall not permit the name of Dr. Steenbock, the University of Wisconsin or the Foundation to be used in the advertising of any product in which such activated yeast products may be incorporated, without the consent and approval of the FOUNDATION.

6. The COMPANY shall pay to the FOUNDATION a royalty of 2¢ per pound for all such activated yeast products, except Foil Yeast, sold by the COMPANY; such payments shall be made semiannually and in addition to other payments provided for under said contract of August 8, 1928.

7. The COMPANY shall make no price discrimination in the sale of such activated yeast products in favor of nonlicensees.

II

It is understood by the parties that producers of milk are now seeking to increase the antirachitic qualities of milk by the use of activated yeast as a part of the ration of cows, and it is agreed that the COMPANY will not sell its activated dried yeast to milk producers unless they have a license from the FOUNDATION in the form of Exhibit "B" attached hereto, or similar form as may be mutually agreed upon between the COMPANY and the FOUNDATION from time to time. The FOUNDATION agrees that it will promptly issue a license in such form or similar form and for the consideration therein named, to any and all milk producers designated by the COMPANY, whenever requested by the COMPANY to do so, and it is understood that nothing therein contained shall prevent such licensees from evaporating, condensing or drying such activated milk, or selling the same to other persons, firms or corporations intending to evaporate, condense or dry such activated milk.

III

The FOUNDATION agrees that it will not grant new licenses or permit any of its existing licensees, except insofar as such licensees may already be licensed, to sell or use irradiated ergosterol or any solution thereof as a source or medium of imparting Vitamin D properties to liquid milk to be marketed as such, provided, however, that if the parties, having in mind the public welfare, shall mutually agree that the activation of any particular grade or grades of milk, other than certified milk, by direct addition of ergosterol or any solution thereof (as differentiated from feeding such ergosterol or solution thereof) is a more suitable or satisfactory means of imparting Vitamin D qualities to such milk, than thru the medium of feeding Irradiated Dry Yeast, then this restriction shall not apply as to such grade or grades of milk.

In the absence of such mutual agreement, it is understood that nothing in this paragraph shall prevent the FOUNDATION after two (2) years from the date hereof, from granting licenses to dealers in milk to use irradiated ergosterol or solutions thereof derived from yeast for direct incorporation into grades of milk other than certified milk as a means of imparting Vitamin D thereto, provided, that the FOUNDATION will not grant any such licenses to producers of milk who may be using irradiated dry yeast. In the event that the FOUNDATION grants any such licenses, the COMPANY agrees that it will supply to such licensees irradiated ergosterol at prices that shall not be in excess of prices which the COMPANY is then obtaining for irradiated ergosterol sold for other purposes, and in no event shall such price be in excess of ONE ($1.00) DOLLAR for 666,666 present Steenbock Vitamin D units.

Digitized by Google

IV

The COMPANY shall cooperate with the FOUNDATION to the best of its ability in enforcing the provisions and restrictions of the preceding paragraphs, and to this end agrees that it will promptly discontinue the sale of such activated yeast products to any person, firm, or corporation wrongfully using, disposing of, or intending to wrongfully use or dispose of such yeast; it being understood that the FOUNDATION and the COMPANY shall be in mutual accord as to the facts of such wrongful use or disposition, or intended wrongful use or disposition of such yeast.

The COMPANY further agrees that it will promptly discontinue the sale of such activated yeast products to any person, firm, or corporation licensed by the FOUNDATION when it comes to the attention of the COMPANY by notice or otherwise that such person, firm, or corporation is violating the provisions of its license from the FOUNDATION, it being understood, however, that the FOUNDATION and the COMPANY shall be in mutual accord as to the facts of such violation.

It is distinctly understood and agreed, however, that the COMPANY shall not be responsible or in any way liable for the wrongful acts or representations of any purchaser or user of said products.

V

The COMPANY agrees that it will keep complete records of the sales of its activated yeast products (except Foil Yeast) and will furnish summaries of such records to the FOUNDATION semiannually. The COMPANY further agrees that it will, upon request, furnish information as to the amount of activated yeast sold to any licensee whom the FOUNDATION may wish to investigate.

Promptly upon the execution of this Supplemental Agreement the COMPANY shall dismiss the appeal in the case of *Standard Brands Incorporated* v. *The Wisconsin Alumni Research Foundation*, now pending in the Supreme Court of the State of Wisconsin.

VII

It is also agree that the following language appearing in Clause IX of the contract dated August 8, 1928, shall not hereafter be operative:

> and shall be such amounts plus an amount, if any, which shall be determined and fixed by the Company at the end of each year after reviewing its licensed operations for such year and in good faith based upon the profitableness and the general value and benefit of the licensed inventions to the Company during such year, and which shall appear, in the judgment of the Company to be fair and reasonable. It is understood and agreed that each such extra amount determined and paid by the Company in excess of the $25,000.00 per year minimum shall be considered independently of any such amount of the same character which may have been paid theretofore or which may be paid thereafter.

VIII

All other provisions of the contract of August 8, 1928, shall remain unaltered except as expressly modified by this Agreement.

In witness whereof, the Parties have hereunto affixed their corporate seals and caused these presents to be signed, the WISCONSIN ALUMNI RESEARCH FOUNDATION, by its officers, and STANDARD BRANDS, INCORPORATED, by its officers, thereunto duly authorized by their respective Boards of Directors.

SUPPLEMENTAL AGREEMENT

Supplemental Agreement made this 21st day of January 1932, between the Wisconsin Alumni Research Foundation a Wisconsin corporation not for pecuniary profit, and the Standard Brands, Incorporated, a corporation organized and existing under and by virtue of the laws of the State of Delaware,

WITNESSETH

That whereas by License Agreement dated August 8, 1928, the Wisconsin Alumni Research Foundation has granted to the Fleischmann Company (now Standard Brands, Incorporated) a license under application for United States Letters Patent, Serial No. 723,171, and Letters Patent No. 1,680,818, issued thereon, upon the terms and conditions therein specified, and

Whereas there is now pending in the Supreme Court of the State of Wisconsin an appeal by the Standard Brands, Incorporated from the decision in a suit instituted by said Company in the Circuit Court of Dane County to obtain a judicial construction of Paragraph IIA of said contract, and

Whereas it appears that such appeal cannot be judicially disposed of prior to February 1, 1932, the date on which the license now held by the Standard Brands, Incorporated pursuant to said contract and an extension thereof expires, and

Whereas pursuant to Section IX of said contract and pursuant to the provisions of a Supplemental Agreement heretofore entered into by the parties, the Standard Brands, Incorporated has a certain option for a five-year renewal of said license, which may be exercised while its license rights are still in force—that is to say prior to February 1, 1932, and

Whereas the parties desire to extend the time at which such option may be exercised by Standard Brands, Incorporated, it is hereby agreed:

I

The right of Standard Brands, Incorporated, to exercise the five-year renewal option contained in Section IX of said contract of August 8, 1928, is extended from February 1, 1932, to August 1, 1932, during which period the licenses now in force pursuant to said contract of August 8, 1928, shall be extended.

II

In consideration of the above granted rights, Standard Brands, Incorporated, shall on February 1, 1932, pay to the Wisconsin Alumni Research Foundation the sum of TWELVE THOUSAND FIVE HUNDRED ($12,500) DOLLARS as a minimum full royalty for such extended period.

Digitized by Google

III

On August 1, 1932, Standard Brands, Incorporated, will review its licensed operations as provided in Section VIII of the contract of August 8, 1928, as to the two-year period therein mentioned, and also as to the periods from August 1, 1931, to February 1, 1932, and from February 1, 1932, to August 1, 1932, and in good faith, based upon the profitableness and general value and benefit of the licensed invention to the Company during such periods make such increased payments if any, therefor, to the Foundation as shall, in the judgment of the Company, be fair and reasonable.

In witness whereof the parties have hereunto affixed their corporate seals, caused these presents to be signed, the Wisconsin Alumni Research Foundation by its agents and Standard Brands Incorporated, by its officers, thereunto duly authorized by their respective Boards of Directors.

SUPPLEMENTAL AGREEMENT

Whereas by License Agreement dated August 8, 1928, the Wisconsin Alumni Research Foundation has granted to The Fleischmann Company (now Standard Brands, Incorporated) a license under application for United States Letters Patent Serial No. 723,171, and Letters Patent No. 1,680,818, issued thereon, upon the terms and conditions therein specified; and

Whereas there is now pending in the Circuit Court of Dane County, Wisconsin, a suit instituted by Standard Brands, Incorporated, against the Wisconsin Alumni Research Foundation to obtain a judicial construction of Paragraph IIA of said contract; and

Whereas it appears that such suit cannot be judicially disposed of prior to August 1, 1931, the date on which the license now held by Standard Brands, Incorporated, pursuant to said contract expires; and

Whereas pursuant to Section IX of said contract Standard Brands, Incorporated, has a certain option for a five-year renewal of said license which may be exercised while its license rights are still in force, that is to say prior to August 1, 1931; and

Whereas the parties desire to extend the time at which such option may be exercised by Standard Brands, Incorporated, it is hereby agreed:

Digitized by Google

1. The right of Standard Brands, Incorporated, to exercise the five-year renewal option contained in Section IX of said contract of August 8, 1928, is extended from August 1, 1931, to February 1, 1932, during which period the licenses now in force pursuant to the said contract of August 8, 1928, shall be extended.

2. In consideration of the above-granted rights, Standard Brands, Incorporated, shall on August 1, 1931, pay to the Wisconsin Alumni Research Foundation the sum of TWELVE THOUSAND FIVE HUNDRED ($12,500) DOLLARS as minimum full royalty for such extended license period.

3. On February 1, 1932, Standard Brands, Incorporated, will review its licensed operations as provided in Section VIII of the contract of August 8, 1928, as to the two-year period therein mentioned, and also as to the period from August 1, 1931, to February 1, 1932, and in good faith, based upon the profitableness and general value and benefit of the licensed invention to the Company during such periods make such increased payments if any, therefor, to the Foundation as shall, in the judgment of the Company, be fair and reasonable.

In witness whereof the parties have hereunto affixed their corporate seals, caused these presents to be signed, the Wisconsin Alumni Research Foundation, by its agents, and Standard Brands Incorporated, by its officers, thereunto duly authorized by their respective Boards of Directors.

AGREEMENT

This agreement dated the 8th day of August 1928 between THE WISCONSIN ALUMNI RESEARCH FOUNDATION, a corporation not for profit under the laws of the State of Wisconsin (hereinafter called the Foundation) and THE FLEISCHMANN

Digitized by Google

COMPANY, a corporation organized and existing under the laws of the State of Ohio and having a principal office in the City, County and State of New York (hereinafter called the Company), each by its proper officers thereunto duly authorized, WITNESSETH:

I. The Foundation represents and warrants that it has full right and authority to convey the license rights hereinafter granted.

II. The Foundation grants the Company under application for United States patent, Serial No. 723,171, filed June 30, 1924 by Harry Steenbock and under any and all United States Letters Patent which may eventuate therefrom, and under any and all additional United States patents and applications therefor now owned or hereafter acquired by the Foundation relating to antirachitic activation of substances (all hereinafter referred to as the Foundation patent rights) the following rights and licenses for the entire effective territory of said patents,

A. The exclusive right and license to manufacture antirachitically activated Foil Yeast, Dried Yeast, Autolyzed Yeast, Hydrolyzed Yeast, and the like yeast products whether antirachitically activated in bulk (directly) or by incorporation therein of separately antirachitically activated substance (indirectly) and to sell such antirachitically activated Foil Yeast, Dried Yeast, Autolyzed Yeast, Hydrolyzed Yeast, and the like yeast products without restriction throughout the United States and Canada, the Company agreeing, however, that it will not knowingly sell any of its products licensed under this paragraph in substantial quantities in the exclusive licensed field of any other licensee of the Foundation under the Foundation patent rights and that, if such sale should occur, it will after notice use all reasonable business effort in good faith to prevent the recurrence thereof.

B. The exclusive right and license to manufacture antirachitically activated compressed yeast of the type used commercially by bakers or in the home whether antirachitically activated directly or indirectly and to sell the same only to other licensees of the Foundation.

C. The exclusive right and license to make and the exclusive right and license to sell, but only to other licensees of the Foundation, yeast and yeast products, as defined in Paragraph A and B above, but unactivated, for use as a source of antirachitically activatable unsaponifiable lipoids for antirachitic activation, it being understood, however, that the right and license of the Company under the provisions of this Paragraph C shall remain exclusive only during the period or periods that the Company's net selling price for such yeast and yeast products to other licensees of the Foundation shall not be in excess of the Company's net selling price for equal quantities of similar substance sold under similar conditions as to delivery and the like at the same time to bakers or the Company's other trade customers. It is understood and agreed that the rights of the Company to sell unactivated compressed yeast shall not be affected by any provisions of this agreement and that such sale by the Company shall not affect the term or force of this agreement.

D. A nonexclusive right and license to make and the exclusive right and license to sell, but only to other licensees of the Foundation, antirachitically activatable unsaponifiable lipoids, for antirachitic activation, derived from compressed yeast or dried yeast or other yeast used commercially by bakers or in the home, it being agreed, however, that the right and license of the Company under the provisions of this paragraph D shall remain exclusive only during the period or periods that the Company's net selling price therefor to other licensees of the Foundation shall not be more than ____ in excess of the bona fide cost to such licensees of equal quantity of such substance of equal quality imported from abroad (save for such prohibition) and delivered at the same point in the United States with duty and transportation charges paid.

E. A nonexclusive right and license to make and/or sell, but only to other licensees of the Foundation, antirachitically activated unsaponifiable lipoids derived from yeast and yeast products.

III. The Foundation undertakes and agrees that all future licenses which it may grant under the Foundation patent rights shall be granted in all cases subject to the rights of the Company as hereinabove set forth and that no license shall be granted by the Foundation to any other yeast manufacturer, in the United States or Canada, than the Company.

IV. The Foundation undertakes and agrees that in each license hereafter executed under its patent rights, it will incorporate a restrictive provision whereby such licensee shall not be licensed to import into the United States any antirachitically activated foil yeast, dried yeast, autolyzed yeast, hydrolyzed yeast, or compressed yeast, and shall not be licensed to antirachitically activate in the

Digitized by Google

United States any foil yeast, dried yeast, autolyzed yeast, hydrolyzed yeast or compressed yeast imported from outside the United States.

V. The Foundation further undertakes and agrees that in each such future license (with only the possible exception stated in Paragraph VI following) it will also incorporate a restrictive provision whereby such licensee shall not be licensed to import into the United States any antirachitically activatable unsaponifiable lipoids derived from yeast or yeast products for antirachitic activation nor any antirachitically activated unsaponifiable lipoids derived from yeast or yeast products during any period or periods that such licensee can purchase from the Company such substances, of equal or better quality, at prices not more than in excess of the actual cost to such licensee of such material purchasable by it (save for such prohibition) outside the United States for importation into the United States with duty and transportation charges paid.

VI. It is understood that the Foundation is negotiating with certain pharmaceutical manufacturing companies for the grant of licenses under the Foundation patent rights for the manufacture and sale of antirachitically activated unsaponifiable lipoids for medicinal and pharmaceutical purposes. If, in the opinion of the Foundation, the successful conclusion of such negotiations requires it, then it is agreed by the parties hereto that as to such licensees only and as to such licenses only for antirachitically activated unsaponifiable lipoids for sale for medicinal and pharmaceutical purposes and not for sale to any other licensees of the Foundation the restrictive provision of paragraph V above shall not apply.

VII. Whereas Steenbock, the inventor above named, has not yet determined upon the dosage or degree of antirachitic activation for the contemplated licensed operations of the Company with the precision desirable for commercial operations, it is agreed by the parties that the licenses hereby granted the Company shall begin from the date hereof and extend over a period of two years from a date sixty (60) days after the Company shall indicate its approval of or agreement on the matter of dosage or of degree of antirachitic activation of its licensed product foil yeast. It is understood that Steenbock will proceed with diligence to determine and advise the Company regarding this matter of dosage or degree of antirachitic activation and the Company agrees that it will with diligence thereafter and in good faith consider such recommendations and test the same to the end of reaching an early approval thereof or mutual agreement regarding the matter.

VIII. The Company agrees to pay the Foundation in full payment for the licenses hereinabove granted, the minimum sum of FIFTY THOUSAND ($50,000) DOLLARS payable as follows:

TEN THOUSAND ($10,000) DOLLARS on the execution of this agreement;
TEN THOUSAND ($10,000) DOLLARS on the date of the beginning of the two-year period provided for above in Paragraph VII and
TEN THOUSAND ($10,000) DOLLARS semiannually thereafter until said FIFTY THOUSAND ($50,000) DOLLARS is fully paid.

The Company agrees, moreover, that at the end of said two-year period it will review its licensed operations, and in good faith, based upon the profitableness and general value and benefit of the licensed inventions to the Company during said period, make such increased payment, if any, therefor to the Foundation as shall, in the judgment of the Company, be fair and reasonable.

IX. The Foundation hereby grants the Company an option to extend the licenses hereinabove granted for an additional term of five (5) years and also grants the Company an option to extend the licenses hereinabove recited for such period beyond said five (5) years extension as will constitute the balance of the full term and life of any United States Letters Patent of the Foundation hereinabove referred to, it being understood that the said options are independent and may be independently and successively exercised by the Company and that the amounts payable by the Company to the Foundation as full royalty during the term of either of such extended licenses shall be a minimum of $25,000.00 per year and shall be such amount plus an amount, if any, which shall be determined and fixed by the Company at the end of each year after reviewing its licensed operations for such year and in good faith based upon the profitableness and the general value and benefit of the licensed inventions to the Company during such year, and which shall appear, in the judgment of the Company to be fair and reasonable. It is understood and agreed that each such extra amount

Digitized by Google

determined and paid by the Company in excess of the $25,000.00 per year minimum shall be considered independently of any such amount of the same character which may have been paid theretofore or which may be paid thereafter. Each of the options hereby granted may be exercised by the Company and the extended licenses thereby secured to the Company at any time while license rights of the Company are in force and that written notice to such effect deposited in the registered mail and addressed to the Foundation shall be a sufficient exercise of each of said options.

X. The Foundation agrees that the name "Steenbock" and the title "The Wisconsin Alumni Research Foundation" may be used by the Company in advertising its products made under the license granted hereby, but to the extent only as follows:

(a) The Company's advertising which includes said name and/or said title shall be of a dignified and ethical character and not extravagant and not sensational;

(b) The Company's advertising which includes said name and/or said title shall so far as it advances therapeutic claims for its advertised products arising from inclusion therein of any invention within the Foundation patent rights, confine said claims within the limits of fact statement to be defined by the Foundation promptly hereafter;

(c) The Company's advertising which includes said name and/or said title shall be accompanied by a legend or phrase as follows:

> "Made under the Steenbock process as licensed by the Wisconsin Alumni Research Foundation."

(d) No restriction shall ever be imposed on the Company's advertising under the provisions of this paragraph beyond restrictions which the Foundation has imposed, and/or shall impose, upon all of its other licensees under the Foundation patent rights.

XI. Promptly upon the execution of this agreement the Company undertakes to disclose to the Foundation or to Dr. Steenbock the full recommendations of the Company's patent counsel as to the procedure and means for improving the Foundation's patent rights and the Company undertakes further to instruct its attorneys to cooperate to the fullest extent with Dr. Steenbock and/or the Foundation's patent counsel to effect such improved status of the Foundation's patent rights.

XII. It is understood and agreed that the parties, as promptly as possible hereafter, will endeavor to agree on suitable provisions to be incorporated in this agreement, or a supplemental agreement, affecting their ancillary or incidental respective obligations. As examples of such matters on which the parties will endeavor to reach such agreement are the following:

(a) The effect of a final and determinative decree by a court of competent jurisdiction adjudging the claims of the Foundation patents which cover the licensed operations of the Company to be ineffective to protect the Company's operations under the licenses hereby granted;

(b) The effect of a final and determinative decree by a court of competent jurisdiction enjoining the Company from continuing its operations or any of them under the licenses hereby granted.

(c) The institution and maintenance of suits against infringers of the Foundation patent rights, insofar as such infringement may arise to the prejudice of the Company's rights under the licenses hereby granted;

(d) The rights of the parties in and to any future patentable inventions which may be developed by the Company by way of improvement on the subject matter of the Foundation patent rights under which the Company is licensed;

(e) The rights and obligations of the parties in the event that the Company is sued by any third party for patent infringement arising from the operations of the Company under license from the Foundation.

In witness whereof the parties have hereunto affixed their corporate seals and caused these presents to be signed, THE WISCONSIN ALUMNI RESEARCH FOUNDATION, by its agents, and THE FLEISCHMANN COMPANY, by its officers, thereunto duly authorized by their respective Boards of Directors.

It is understood by the parties that the statement of permissible claims for the Company's advertising referred in paragraph X, subparagraph (b), shall include a provision whereby the Company's advertising use of the name "Steenbock" (beyond the use thereof in the legend of said paragraph) shall be submitted in advance for approval to a Trustee of the Foundation in New York City, appointed for the purpose, and that such approval shall not be unreasonably withheld or delayed.

MARCH 9, 1938.

Mr. WARD ROSS,
General Counsel, Wisconsin Alumni Research Foundation,
Chicago, Ill.

DEAR WARD: In reply to your letter of March 4, we are sending you copies of the Whittier patents, which we feel are valid. However, we have done some work along this line and feel that this is a rather expensive process. We will be interested in getting your opinion as to its validity.

With respect to the Chesney matter, all I know is that 35 cents per million units was quoted to General Baking Co. I do not know whether the material was activated by ultraviolet rays or the sun's rays.

As my plans now go, I will be in Chicago on Tuesday, March 16, on a rather hurried trip, due to the fact that I am sailing for England and the Continent on Friday noon, March 18. I will 'phone you upon arrival to make a definite date.

I have not answered the Dean's letter concerning shrimp waste as a source of Vitamin D, because I have judged that he has been away all this time and hoped to talk it over with him in person. If he has returned, please tell him for me that I thank him for sending this information. Dr. Waddell has done considerable work along this line and I think it would be interesting for Dr. Waddell and Dr. Scott to discuss this question the next time they get together.

With kindest personal regards and looking forward to seeing you next Tuesday, I remain

Very truly yours,

KENNETH T. KING,
Manager, Fine Chemicals Division.

E. I. du Pont de Nemours & Co., Inc.,
Wilmington, Del., March 5, 1940.

Mr. L. D. Barney,
The Wisconsin Alumni Research Foundation,
Madison, Wis.

Dear Dave: In reply to your letter of February 24 we are very much interested in modifying our contract with respect to the maximum and minimum provisions in the baking field. In fact, we believe the simplest way to handle this question is to delete from our present contract the clause specifying maximum and minimum provisions. This, of course, was explained to you over the telephone in our recent conversation concerning General Baking. I believe unless some change is made in the maximum and minimum provisions all business in this field will be lost by the licensees of the foundation.

Very truly yours,

Kenneth T. King,
Manager, Fine Chemicals Division.

Wisconsin Alumni Research Foundation,
Madison, Wis., March 14, 1940.

Mr. Kenneth T. King,
E. I. du Pont de Nemours & Co.,
Wilmington, Del.

Dear Ken: This will acknowledge receipt of your letter of March 5 regarding the maximum and minimum price provisions with respect to the baking field. Shortly, Ward will send Art either a letter agreement or supplemental contract deleting this provision from the contract.

In the meantime, the gentlemen from the H. C. H. Co. called at the office again. They tell us they have a bakery group pretty well sold on their powdered milk with vitamin D incorporated therein. While they cannot give us any positive statement as to their annual consumption of D units, at the outset it probably would be ten to fifteen billion units per year.

They have received a quotation from General Mills at a price of 60 cents per million, but they prefer to do business through you and the foundation, for many reasons, one of which is that they desire to have their customers use the foundation seal on the bread label.

Will you kindly let us hear from you at your early convenience as to what price you would quote these people for vitamin D in sesame oil for use in milk powder for bread production. You can make your quotation on the assumption that the maximum and minimum price provisions in the contract will be deleted prior to the time the order is placed.

Very truly yours,

Wisconsin Alumni Research Foundation,
L. D. Barney, *Business Manager.*

Wilmington, *July 26, 1932.*

Lever Bros. Contract.

Mr. S. A. Atkins,
Sales Manager, Acetol Products, Inc., 260 West Broadway, New York City.

This morning I reported to Mr. Protto and Mr. Robinson regarding conversation with Dean Russell and also the known facts concerning Lever Bros. business. It was Mr. Protto's feeling that we should raise our prices as much as possible and should not sell the material cheap.

My analysis of the information that you secured this morning from Standard Brands is that they are beclouding the issue when they quote on irradiated yeast. I do not believe Standard Brands are in position to quote on irradiated ergosterol the same as you can quote. In some way you must get this fact across to Reeves and in some way it is necessary to let Reeves know that unless we can make a satisfactory deal as to minimum payments received during the coming year from Lever Bros., they may not be able to obtain irradiated ergosterol at all. I think

Digitized by Google

that you should find some excuse for seeing Reeves shortly and talking to him so as to be able, in conversation, to get across to him the fact that we need to have a guaranteed minimum business of about $30,000 the first year from Lever Bros. in order to meet the conditions which the Wisconsin Alumni Foundation are imposing upon us.

The situation with Fleischmann is that their renewal time comes next year, when they will have to pay $25,000 minimum and we do not believe that they will ever submit to such a figure, so if Lever Bros. tie up with Fleischmann now because Fleischmann promises to put in a plant to produce stuff for them, they will be in a bad position a year from now. You can also make plain to Reeves that we seem to have the only practical source of ergosterol and have allowed claims on our patent application for its isolation.

Please let me know what plan of action you work out.

GEORGE B. BRADSHAW,
Vice President, Acetol Products, Inc.

ACETOL PRODUCTS, INC.

INTEROFFICE CORRESPONDENCE

Attention of: Mr. George B. Bradshaw, Vice President
Subject: Lever Bros. Contract.
To: Wilmington Office.
From: New York Office.

Date 7/27/32.

This acknowledges your letter of the 26th with reference to our selling vitamin D to subject concern.

It seems obvious to me that we should always try to get the maximum price for any of our goods, keeping in mind the possible potential volume and competitive conditions.

According to authentic price information which we have secured, Fleischman have been selling and offering vitamin D at slightly less than $1.00 per 1,000,000 Steenbock rat units. This is what influenced my suggested price of $1 to Lever Bros. and I was very much surprised when you informed me that Fleischman was not in a position to furnish irradiated ergosterol. If this were true, I apparently had gone too low on our initial price, in view of the fact that we were the exclusive source of supply. From Mr. Loeffler's (of Fleischman) conversation with me, and the information which you subsequently obtained, it seems to be definitely established that Fleischman can furnish irradiated ergosterol.

With this in mind and with the desire to increase our own profit, I will go over the matter very carefully with Mr. Reeves and believe I can learn the price which Fleischman has quoted. I will carry out your suggestion with reference to our payment to the foundation in my negotiations with Mr. Reeves and you can be assured that if there is the remotest possibility of boosting the price or getting a maximum guarantee of $30,000 for the first year, this will be done.

In connection with the proposed plant of Lever Bros., I understand that this plant is practically completed and this information apparently is true because I doubt that they could construct a $5,000,000 plant between now and September. It is my opinion that Lever decided to go into the food shortening field and tried to blast their way into top place by a huge advertising program. I believe that the addition of vitamin D was sort of an afterthought and that Lever believes that this additional selling point for the food shortening will give that little extra stimulus that will put their project over. I question the Foundation's business judgment in licensing Lever as against Procter & Gamble but, after all, we have an actual condition confronting us and theorizing isn't going to pay us any dividends.

There is one more thought in my mind and that is the reason for Mr. Reeves' silence if what Dean Russell told you is true; namely, that the license has already been granted to Lever Bros. I have known Mr. Reeves for about 18 years and know that his word is about as good as his bond and he promised faithfully to let me know the moment that they were ready to proceed and I am just wondering whether Dean Russell finally decided to concede to Lever Bros.' requests in the matter of potency and has assumed that they have accepted his proposal. If, for some reason, Lever does not wish to go ahead with this project because of

Digitized by Google

present business conditions, Dean Russell may be in for a rude awakening and may be able to negotiate again with Procter and Gamble.

Unless something unforeseen happens, I will see Mr. Reeves at Cambridge Monday or Tuesday of next week.

S. A. ATKINS.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis., July 18, 1935.

Mr. STUART A. ATKINS,
Director of Sales, Cel-O-Glass Section,
E. I. du Pont de Nemours & Co., Inc.,
Wilmington, Del.

DEAR MR. ATKINS: The delay in replying to your letter of July 8 has been caused by my absence from the city.

This will confirm your understanding of the fluid milk situation, and while we have not yet proceeded on the basis we outlined to you in New York, with reference to the suits, we will probably go ahead on a somewhat different basis than we originally discussed. In Michigan, for example, the attorney general has already given a decision that the addition of concentrates to milk is illegal, so that in that State it may be possible to bring the matter to a head without going into litigation. We have further decided that it would be unwise to start a large number of suits at one time but to limit the cases to one or two.

BREAD SITUATION

It is very difficult to put into a letter the various ramifications that now confront us in this entire bread field. Last week we had a very pleasant conference with Dr. Waddell, and we outlined to him in considerable detail the various factors in this picture, and asked him to bring you up-to-date on the situation. As we explained to you in New York, we cannot possibly consider licensing Commander Larabee for commercial baker's flour at the present time, inasmuch as General Baking has evidenced a desire to get back into the fold. Further, we could not have joint licenses for the activation of miller's flour to be sold to bakers and at the same time sell ergosterol to the baking industry because of the variance in cost. It is contemplated that the baker's flour would sell at no increase in price, so that it would be quite impossible to sell ergosterol to the baking industry in competition with this mode of procedure. Frankly, at the present time, I do not feel that as satisfactory a coverage could be obtained by the use of activated baker's flour as could be the case in the sale of irradiated ergosterol to bakers.

We are very interested in the proposal which you outline in the third paragraph of your letter. The only suggestion we have to offer is that the program be kept on as simple a basis as possible, together with a reduced number of bioassays per year. We feel that some mechanical check on the sale of ergosterol and the amount of bread produced, together with four bioassays per year, would be sufficient. Further, it would seem advantageous for us to figure the cost of the bioassays in the selling price of the ergosterol so that the baker would have only one fee to pay.

Dr. Waddell stated that it was his opinion that if General Baking came back into the picture a higher price for ergosterol should be charged. We discussed the possibility of a price of $1.25 to $1.50 per million Steenbock units.

CONTRACT MODIFICATION

We appreciate the situation which confronts your company under the terms of the existing contract as far as royalty payments are concerned. We are very glad to have your suggestion as to what you consider to be a fair revision of the license terms. We have not discussed this with the trustees, and as a matter of fact, we will not be able to do so for a few weeks, inasmuch as we probably will not have a meeting until August. Ross and I have discussed the matter to a limited extent and it is our opinion that if the Foundation waives the entire minimum guaranty that a fair and equitable royalty basis would be 10 percent. It is not our desire to work a hardship on any licensee with reference to royalty terms, however, we would be pleased to get your reaction to such a basis of royalty calculations.

We appreciate the sentiment expressed in the second paragraph of your letter on page 2, and we are glad to know that your company desires to continue as an integral part of this organization. Your desire to keep vitamin D from falling

Digitized by Google

into disrepute through the licensing of unwarranted products is certainly in harmony with the policy of the Foundation.

With respect to Spaulding and the Canadian bakers, we cannot at this time make any definite negotiations on the matter of ergosterol prices. As we explained to you in New York, we must exercise our option with National Foods to take over the entire business before we will be in a position to furnish these companies with ergosterol. We are using every effort, however, to bring these matters to a definite settlement, and I am quite sure we will do so as soon as we hear further from General Baking.

We will be very glad to receive your prospectus with reference to the development of the bread field by your company and we shall look forward to hearing from you at an early date.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
L. D. BARNEY, *Assistant to the Director,*

MEMORANDUM FROM KENNETH T. KING TO RALPH HORTON AND W. S. KIES

SEPTEMBER 19, 1935.

With respect to Mr. Kies' letter to Dean Russell, I am making the following suggestions to be passed on to Mr. Ward Ross, attorney for the foundation.

1. 20-percent royalty should be specified as to the bread and buttermilk fields.
2. 7-percent royalty should be specified as to the poultry field and other fields with the exception of the pharmaceutical field.
3. We would be willing for the foundation to grant nonexclusive license for the sale of vitamin D from ergosterol in the bread field to the Fleischmann Co., providing the price of the vitamin D in the bread field shall be stabilized and that an agreement be reached as to control and assay work.
4. Du Pont will have exclusive rights for the sale of vitamin D from cholesterol in the bread field.
5. Paragraph five of Mr. Kies' letter to Dean Russell be revised to state only that 5-percent royalty be paid for vitamin D from cholesterol or ergosterol sold to the pharmaceutical industry.
6. To hasten the completion of this agreement, we suggest that Mr. Ross come to Wilmington to consult with our legal department so that an agreement can be drawn up before the trustees' meeting on September 27.

CONFERENCE WITH DR. HOOPER OF WINTHROP COMPANY, THURSDAY, NOVEMBER 14TH, 1935, NEW YORK

Hooper said that irradiated cholesterol is no good as a commercial product because you cannot get the concentration—that is the ratio of possible concentration between cholesterol and crystalline vitamin D is about 1 to 1,000.

I called Dr. Hooper's attention to the recent advertisement by the Winthrop Co. of its new product, drisdol, appearing in a recent issue of the Medical Record, page 14. I told Dr. Hooper that this ad had just come to our attention late in the afternoon the day before, and that we had not had a chance to discuss it among ourselves at all. I said that I was not acquainted with the work of Dr. Lewis upon which the advertising claims were based, but that assuming the truth of the claims, I thought the ad was objectionable from the following two standpoints:

(*a*) The ad makes a direct comparison between drisdol and viosterol. Comparisons are odious and the result of this ad is disparagement of viosterol.

(*b*) By stressing in the ad the use of crystalline vitamin D in milk, it might be considered that Winthrop was conflicting with our food field and thus going beyond the scope of its pharmaceutical license.

Hooper was very firm in his conviction that the claim that one drop of drisdol in milk was equivalent to 10 drops of Viosterol in oil was justified by Lewis' 1935 experimental work. Hooper said that if Winthrop could not make this claim they might as well not put the product on the market because that was the only talking point they had over viosterol. He said that all of their work was wasted if this claim could not be used. I suggested that they could in any event use the claim of greater purity, but he said this meant nothing from a merchandising standpoint. Hooper first said that Dr Lewis' work on crystalline vitamin D in

Digitized by Google

propylene glycol solution was independent of Winthrop and that Winthrop had nothing to do with it. Later, however, he admitted that they had financed the study and had spent a considerable amount of money on it, including $15,000 for milk alone. He justified the advertising claim (although he admitted he had not seen the ad) by saying that it was a true statement and was not intended to disparage viosterol. Being true, he claimed the statement was justified, even though its effect was adverse to viosterol. He claimed that the product will be and is being sold as a pharmaceutical product, and is in no sense an encroachment on the food field.

With regard to the comparison between viosterol and drisdol, I asked Hooper how he would like it if our milk licensees said that 1 quart of irradiated milk was equal to 10 drops of viosterol. Hooper claimed that this would be an invasion of the pharmaceutical field by our milk licensees and that they would be selling milk as medicine.

I explained to Hooper that in my brief conference the day before with E. S. Rogers, Mr. Rogers agreed with me that the ad was objectionable in that it disparaged viosterol. Hooper said that Rogers apparently was not acquainted with the facts and Hooper made arrangements to see him at dinner after our conference.

Dr. J. M. Lewis was at the irradiation conference and we discussed this situation with him after the meeting. Lewis said that he had no opinion on the question of making comparison between different products, and that this was simply a matter of commercial ethics. Lewis said that the statement in the advertisement was true as a scientific fact, if modified in the following respects:

(a) The ratio should be 2 to 10 instead of 1 to 10.

(b) The statement should say: "Two drops of drisdol in the normal daily ration of milk is equal to 10 drops of viosterol in oil," rather than simply "two drops of drisdol in milk is equal to 10 drops of viosterol in oil."

Hooper said that the label on the drisdol product prescribes a dosage of 2 drops per day in milk and 10 drops if taken straight, or other than in milk. He does claim, however, that 2 drops would be sufficient in water, although there is no evidence on this.

Lewis gives two explanations of the fact that drisdol in milk is so much more effective than drisdol alone, or mixed with some other food:

[Hand written:] See Scott about Lewis' work.

(a) Two drops of drisdol given in 24 ounces of milk during the day results, of course, in a great dilution of the vitamin D. The dose, is, therefore, taken piecemeal during the day and results in greater assimilability. Dr. Keenan says that there is something in this argument.

(b) Another possible explanation is that giving the minerals and the vitamin D (milk and drisdol) at the same time is more effective than giving the minerals and the vitamin D separately.

[Hand written:] Then would not viosterol in milk have same effect.

Drisdol is perfectly soluble in milk.

Hooper says that he has a patent application covering solutions of both crystalline vitamin D and ordinary irradiated ergosterol in propylene glycol.

Re Crystalline Vitamin D.

CONFERENCE WITH J. A. KEENAN, NEW YORK CITY, NOVEMBER 15, 1935

Ross raised the question with Keenan regarding the advertising of Winthrop's new crystalline vitamin D product sold as drisdol, appearing in the Medical Record, page 14.

The statement in the advertisement that 1 drop of drisdol in milk is equal to 10 drops of viosterol in oil is based on the work of Dr. J. M. Lewis recently published (March 1935). Keenan felt that the statement of a ratio of 1 to 10 was not justified by Lewis' work. Lewis fed on two levels, 90 United States Pharmacopoeia units a day and 900 United States Pharmacopoeia units a day. He found that 90 units of drisdol in milk was sufficient, whereas 90 units of viostorol in oil was insufficient. He then found that 900 units of drisdol in milk was sufficient and 900 units of viosterol in oil was sufficient. Upon this basis he says he finds a ratio of 1 to 10 The fallacy is the same as found in the earlier work of Hess and Lewis in finding ratios which were later disproved between irradiated milk, cod liver oil, and viosterol.

If Lewis had fed viosterol at lower levels, for example, 300, 500, or 700 units per day, he might have found the ratio quite different than from 1 to 10. Keenan

Digitized by Google

could not say offhand whether there was any clinical work on viosterol in oil showing that less than 900 United States Pharmacopoeia units (10 drops) would be effective in curing rickets.

Keenan says the product used by Lewis was imported calciferol in a propylene glycol solution.

WARD ROSS.

[Handwritten:] Does Lewis article specifically state this. If calciferol, how can Winthrop claim that Lewis' work is clinical on their crystalline V/D. Lewis paper says "Yes."

MEAD JOHNSON & CO., INC.,
Evansville, Ind., May 1, 1933.

Mr. HORACE E. GUNN,
Wisconsin Alumni Research Foundation, Chicago, Ill.

DEAR MR. GUNN: In reply to your letter of April 25, may I say that it is difficult to understand why Mr. Rubenstein of the Galler Drug Co. should appeal to you in the action we took in selling our products. We discontinued the Galler Drug Co. for what we considered good and sufficient reasons and are selling this company none of our products. These reasons were no more concerned with the products which we make and sell under license from you than with all of our products. The fact is that we do not consider the Galler Drug Co. to be a satisfactory distributor of our products.

The fact that the other licensees have discontinued selling the Galler Drug Co. viosterol products is not at all involved in this matter. Our action was taken long before your instructions to discontinue the Galler Drug Co. from the viosterol list were received.

You understand, of course, that in contacting people of this kind, you are in a position of having to take the responsibility, so far as viosterol products are concerned, provided any of the licensees are selling other products of their manufacture to the party.

Licensees cannot make agreements among themselves in these matters and must, of course, take the position that they are acting under instructions from the Wisconsin Alumni Research Foundation. The revelation that that is not the case might prove to be very embarrassing, as you probably realize. My suggestion is that, in cases of this kind, you simply inform the inquiring party that your action was guided by a committee, operating under the Wisconsin Alumni Research Foundation, and that this committee does not reveal its reasons for taking any action of this kind.

I am of the opinion that some of the licensees are still selling other of their products and have informed the Galler Drug Co. that they are not extending most favorable prices on viosterol, because they have been so directed by you. If that is the case, you must back them up.

Trusting that this will assist you in clearing up the matter, we remain

Sincerely yours,

MEAD JOHNSON & CO., INC.,
W. N. LARSON, *Vice President.*

JUNE 29, 1931.

To: N. A. B.
From: W. N. L.

Replying to your letter of June 23, it is quite certain that if the product of any licensee is sold at less than the minimum price to the retail trade, the four other licensees will be at a disadvantage. However, as the price control feature is made possible by the interest of the Wisconcin Alumni Research Foundation, the interest of this organization is a primary consideration insofar as carrying out its wishes is concerned.

To our knowledge there have been very few departures from the suggested minimum price, and these departures have been confined to a very few relatively unimportant wholesale druggists whose objectives, unlike ours, are not to stabilize conditions in the drug trade. It is the legal right of any manufacturer to refuse to sell to a wholesaler or any other customer in fact, who will not carry out his wishes. I hope that it will not be necessary, but it is entirely possible that it may become desirable for the foundation to make the list of preferred jobbers a trifle

Digitized by Google

more exclusive than it is at the present time. We would work with the foundation in any reasonable steps in that direction. Better proof of our desire to have this matter straightened out could hardly be given, we believe.

The instances where departures from this minimum price have been made have had our attention, and so far as we know, "destructive irregularities" have been eliminated for the moment at least.

I might point out again that the minor disadvantages that the other licensees may suffer through the occasional sale of Mead's viosterol at less than the minimum price is more than offset by the fact that we have considered the list price as meaning something and actually recommended the list price, $6.75 per dozen 5 cubic centimeters viosterol is charged in less than dozen lots with the minimum price of $5.75 applying only when 2 dozen is purchased. In line with our desire that wholesale druggists make a fair profit, we have placed ourselves in a position of disadvantage. We believe it would be a constructive step for the other licensees to adopt a suggested schedule similar to ours. I am not ignorant of the fact that some of the licensees at least do not give their best price on products other than viosterol to any direct buyer when purchasing in less than dozen quantities. The fact that the best price is quoted on viosterol sold in any quantity is quite surprising when on other items, 1 dozen to a gross must be purchased in order to enjoy this minimum price.

While our friends, the other licensees, are acting entirely within their rights, an explanation of the reason for this departure from the usual policy on the part of some of the houses would be, indeed, interesting.

Yours very truly,

———— ————.

MEAD JOHNSON & CO.,
Evansville, Ind., December 22, 1936.

Mr. WARD ROSS,
Wisconsin Alumni Research Foundation,
Madison, Wis.

DEAR MR. ROSS: We would have no objection to the Foundation acting as a clearinghouse for information relative to those to whom wholesale terms on viosterol and cod-liver oil with viosterol are extended, except we wonder if such action might not be construed as a violation of law. Anyone investigating this activity might well inquire as to why this was done, if some action which could be construed as collusion or restraint of trade were not contemplated.

This, of course, is a question upon which you can pass better than I, but I do think you should give it some consideration.

Sincerely yours,

MEAD JOHNSON & CO.
(Signed) W. N. LARSON, *Vice President.*

MEMORANDUM TO DR. RUSSELL

NOVEMBER 6, 1935.

As you know, the usual procedure in handling requests of wholesale drug concerns with respect to their addition to the approved wholesaler list for the sale of viosterol products is for the foundation to send the name and address of this company to the five licensees. They, in turn, investigate the company and report back to us whether or not they favor the addition of the said company to the list. The general procedure set up several years ago was that a majority of the licensees (three) would constitute sufficient authority on the part of the foundation to add the name of the company to the approved list.

By reason of the manner in which these are handled, it is impossible for us to tell the licensee when we refuse their request anything other than the fact that the committee, which handles the request, did not approve their application, or, stated in another way, the committee voted in the negative. Obviously, we cannot say that our licensees did not favor the addition of this company to the group.

Sometime ago we sent the name of the Ira J. Shapiro Co., Inc., 45 East Eleventh Street, New York, to the licensees and they voted in the negative without giving any reason for their vote. Their letters merely stated that they saw no reason why this company should be added. The Shapiro Co. represents itself as a very ethical concern, and while it is probably of Jewish management, to date we have

Digitized by Google

not been informed of any unethical practices carried on by this concern. They further state that their company is now purchasing other pharmaceutical products from both Abbott and Winthrop, and they cannot understand why they should be excluded from the viosterol list.

They are more or less putting the foundation on the spot in this matter, and in answer to their numerous letters, we have told them that our committee, which handles these matters, would meet again in November, after which we would advise them further.

Unless the licensees have some good reason for not approving this company, I would appreciate it if you would raise this matter at the pharmaceutical meeting in New York. They may say that these matters are handled by their sales managers; however, their sales managers have already declined this man's application, and I think that the matter should rightfully receive the consideration of the other executives of the various licensees.

In considering these requests, we must realize that if we incur the animosity of the company to the extent that they are sufficiently antagonized to force an investigation into the manner in which these are handled, it might be extremely embarrassing. I do not know whether any wholesale drug concern could bring about such investigation, but, in my opinion, it would be prudent for the foundation to stay on the safe side.

L. D. BARNEY.

MARCH 30, 1932.

POTENCY OF VIOSTEROL

Mead Johnson, March 30, 1932.

Mr. Nielsen, Mead Johnson, long distanced Russell asking what, if anything, has been done relative to the change in potency of viosterol.

They have heard nothing further from the Federal Government.

Nielsen quite perturbed as to possibility of Federal officials starting action against manufacturers for failing to live up to Government requirements. Russell told Nielsen that he did not see how any action could be taken on the part of either the Foundation or the Foundation's licensees until the Government determined the new standard which would then replace the temporary standard set by Steenbock 2 years ago.

Russell understood that the Pharmacopeia committee had this matter now under advisement and that Federal officials were then awaiting such official Pharmacopeia action.

Russell asked Nielsen if they had received any specific communications from Federal officials, intimating that the Government intended to take action. Nielsen said, "No."

Russell said that Steenbock had received a communication from Dr. Cullen of the United States Drug Division and that he (Steenbock) had replied to same.

Owing to Russell's absence in the West, he had not been in close touch with this correspondence.

Nielsen wanted copies of such correspondence. Russell said he could not say whether the contents could be distributed to Mead Johnson (and the other licensees) until he had familiarized himself with the correspondence, both on the part of Federal authorities and Steenbock.

NIELSEN RAISES QUESTION OF VARIABLE POTENCY

Nielsen reported that at the pharmaceutical licensees meeting, in Washington, Government had reported two samples as containing 2½ times the present authorized Steenbock standard. Russell asked Nielsen flatly if Mead Johnson had in any way as yet modified the potency of their product along the lines of the claim which they had made that such should be done. Nielsen denied point-blank that Mead Johnson had altered the potency of their product.

NIELSEN ASKS FOR CHANGE IN POTENCY

Nielsen then said that Mead Johnson was about to make up and pack a large quantity of ergosterol, and in view of the impending action by the Government they felt was about to take, wanted Russell's approval to increasing potency on this new pack—2½ times or 625-Steenbock D units.

Russell said under no condition could such approval be given. That Mead Johnson had no warrant in changing the potency without the knowledge and

Digitized by Google

approval and consent, not only of the Foundation but also of the other four licensees.

Larsen wanted to know what they could do under their conditions? Russell told him they could pack a limited quantity on the old potency that would enable them to transact business until Federal authorities had determined the new standard, and all pharmaceutical licensees were appraised of a change that would be uniform throughout.

Larsen then said that there was a wide variation in potency among the five licensees as determined by the Government examination. Two had been found to be very much over standard and one, at least, below standard. The superpotent samples were not Mead Johnson, and Nielsen disclaimed knowledge as to whose samples were excessively potent.

Russell said that Steenbock had immediately secured samples from channels of trade and had made a provisional run of same but was unable to find any such variation in potency as Federal authorities had reported. These were being rerun to insure complete accuracy relative to potency.

Larsen was very anxious that Russell would write Mead Johnson in regard this whole situation even if he could not convey to Mead Johnson the contents of Washington's letter to Steenbock. A statement that such could not be given would be appreciated in this connection. Larsen appeared considerably perturbed at the possibility of the Government going after them.

Russell said he would see Steenbock in regard to this matter at earliest convenience and would doubtless write him.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
MADISON, WIS., *March 30, 1934.*

ABBOTT LABORATORIES, MEAD, JOHNSON & CO., PARKE, DAVIS & CO., E. R. SQUIBB AND SONS, WINTHROP CHEMICAL CO.

GENTLEMEN: Several questions have arisen in recent months which seem to require early consideration. These can be more readily discussed at a meeting of the Licensees of the Foundation.

1. The impending modifications involved in the matter of labelling Vitamin D products caused by the change from the Steenbock standard to those which are to be promulgated under the auspices of the American Pharmacopoeia.

2. Demand has been made for the sale of bulk or large package containers for use in hospitals only. Criticism is being made that under the restricted budgets of hospitals, the charity cases are not receiving the advantages that should obtain from this treatment.

3. Very severe criticism from certain prominent pediatricians has been lodged against the Foundation on account of the alleged high retail prices of certain Vitamin D preparations. The source and nature of these criticisms are such that they should be met by very earnest consideration.

We are, therefore, asking the Licensees of the Foundation to attend a meeting to be held at the Union League Club, Chicago, Monday, April 9, 1934, at 10 a. m.

Kindly notify us if your company can have representatives at this meeting.

Yours very truly,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
H. L. RUSSELL, *Director.*

CINCINNATI, *May 10, 1940.*

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Chicago, Ill.

GENTLEMEN: We have an inquiry from the government for a substantial quantity of Irradiated Ergosterol and are wondering if we shall have to abide by the price schedule in our license agreement in quoting. In other words, would our quotation have to be the same as our minimum price to wholesalers, or could we figure on a reasonable profit basis taking our cost on such a large quantity for one shipment into consideration?

Since the date for opening the bids is next week it will be necessary for us to have your reply by return mail and we shall appreciate your prompt attention.

Very truly yours,

THE WM. S. MERRELL CO.,
THURSTON MERRELL, *President.*

P. S. We know that the price would have to be much lower than our price to wholesalers to secure the order.

Digitized by Google

MAY 13, 1940.

MR. THURSTON MERRELL,
President, The Wm. S. Merrell Co.
Cincinnati, Ohio.

DEAR MR. MERRELL: We acknowledge receipt of and thank you for your letter of May 10 which was received this morning. Under the present license agreement with your company and the other pharmaceutical licensees of the Foundation under the Steenbock patents the minimum price to be quoted to Government institutions is the minimum wholesale price as outlined in your contract, less two percent discount for cash if paid by the tenth of the following month.

All of the other pharmaceutical licensees of the Foundation have operated under this arrangement for some time. We note, however, your postscript which indicates that the quotation to the Government will have to be lower than the price to wholesalers in order to secure the order. We dislike to see your company or any of our other licensees lose business. If you think the time has arrived for the Foundation to give consideration to the lower quotations on the sale of Viosterol or Cod Liver Oil with Viosterol to Government institutions, we shall be glad to review the matter. We shall be glad to hear from you at your convenience on this subject.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
——— ———, *Business Manager.*

NEW YORK, *July 23, 1934.*

Dean H. L. RUSSELL,
Wisconsin Alumni Research Foundation,
University of Wisconsin, Madison, Wis.

DEAR DEAN RUSSELL: We are in receipt of a copy of the letter, dated July 19, 1934, which was written to you by Mr. G. L. Genz, domestic sales manager of Parke Davis & Co.

As we understand it, the license granted the licensees of the Wisconsin Alumni Research Foundation gives the Foundation only the right to establish the prices and terms at which viosterol in oil and cod-liver oil with viosterol are to be sold to the retail drug trade and the wholesale drug trade.

It is also our understanding that the Foundation does not wish to exercise any jurisdiction over the prices at which viosterol in oil and cod-liver oil with viosterol is to be sold by the retail drug trade to consumers.

Furthermore, the original intention of the Foundation in asking the licensees to reduce their prices on viosterol in oil and cod-liver oil with viosterol to the wholesale and retail drug grade was to lower the prices on these products to the consuming public.

We gave this matter our very serious consideration and wrote to all of the licensees, under date of July 19, 1934, as per copy enclosed and we firmly believe that our suggested full retail prices per package to the consumer and minimum retail prices per package to the consumer for viosterol in oil and cod-liver oil with viosterol are more in line with present market trends and the present economic market conditions than those proposed by Parke Davis & Co.

We are desirous of acting in harmony with all the other licensees of the Wisconsin Alumni Research Foundation in regard to the stabilization of the market for viosterol in oil and cod-liver oil with viosterol. However, we firmly belifve that it is necessary to establish a schedule of minimum retail prices to the consumer such as we have suggested in order to bring about such stabilization.

Fundamentally, of course, it is illegal under the Sherman antitrust law, the Clayton Act, and the Federal Trade Commission Act for any manufacturer to enter into any agreements or understandings, implied or otherwise, regarding the maintenance of specific resale prices at retail or wholesale with any of his retail or wholesale distributors.

As we are going to press with a new price list within the next 5 days, we would appreciate your reaction to the proposal we submitted to all other licensees of the Wisconsin Alumni Research Foundation regarding the establishment of a schedule of full retail prices to the consumer and minimum retail prices to the consumer on viosterol in oil and cod liver oil with viosterol.

Very truly yours,

E. R. SQUIBB & SONS,
R. D. KEIM.
Vice President-Director of Sales.

Excerpt From Conference With Mr. Cain of Abbott Laboratories, North Chicago, Illinois, January 23, 1939

Telephone conference with Dr. Lescohier of Parke, Davis February 13, 1939:

Under date of February 9 Dr. Lescohier wrote to Ross inquiring as to whether the Foundation had made any decision in connection with royalty modification for the reason that they had to decide the matter with reference to Irradol A in the very near future. Ross then explained that we had intended to write to Dr. Lescohier and try to see him in Detroit some time this week; that the Trustees had authorized us to negotiate a lower royalty base with reference to products in which irradiated D is not now being used; that we wanted to discuss this with him in Detroit, and consequently call a meeting of the licensees. I pointed out that the Foundation could not itself take final action in this matter.

Dr. Lescohier then wanted to know if we could assure him that the Foundation would agree to a royalty base not less favorable than that discussed with him in New York, namely, 22¢ per million units. He said that if he could have this assurance they would proceed to make the change in Irradol A. He indicated that they were right now in the process of revising the label and making other changes in the product, and were anxious to know immediately. I promptly gave him the requested assurance, namely, that the Foundation would agree with respect to new products to a royalty rate of not greater than 22¢ per million. On this basis, Dr. Lescohier said they would go ahead immediately.

I then made a tentative appointment with Dr. Lescohier for Wednesday afternoon at Detroit to discuss this entire subject. I subsequently called Russell and Barney at Madison and they agreed that it was proper under the circumstances to give Dr. Lescohier the requested assurance. They also confirmed that it would be desirable to go to Detroit Wednesday and hence I agreed to wire Dr. Lescohier.

Matters to discuss with Lescohier are as follows:

1. What if anything Parke, Davis would do if we went as low as 10¢ to 15¢ per million units.
2. If possible, get volume figures on Irradol A.
3. Discuss matter of concentrated Viosterol for tetany, arthritis, etc., along the line of our Merrell situation.
4. Discuss dates for possible pharmaceutical meeting.

In discussing the matter with Russell and Barney, it was suggested that we communicate with Abbott and ascertain when Clough will return and whether the Abbott people could participate in a meeting the latter part of February.

* * * * * * *

Squibb has a two years supply of tuna liver oil on hand, but they could find plenty of other uses for this oil in the poultry field and elswhere and the existence of this inventory would not prevent Squibb working out the proposed arrangement with us.

It was the opinion of Dr. Anderson and Mr. Lewis that because of the name and character of promotional work on the product in the past they could not use Irradiated ergosterol in Navitol. They could, however, use Irradiated D in ABDG capsules, Adex Tablets, and Vigraine capsules.

Dr. Anderson raised the question as to whether royalties would be calculated upon the labeled potency of the product or the actual number of million units used. He pointed out that in every product they put a minimum of 15% excess of the labeled potency. In Dicalcium phosphate compound with viosterol, they use about 1,000 units per tablet and per capsule, whereas the labeled claim is 660 units, for the reason that there is a considerable loss of D potency in the process of manufacturing.

Lewis raised the question of royalties on what he termed high priced products, obviously referring to Dicalcium phosphate compound with viosterol. The royalties on this product range as high as 80¢ per million units in the smaller sized packages. We pointed out that there were two objections to making such a change. First, that we had no authority from the Trustees to change royalties on any present licensed products and second we felt that making such change would probably require the unanimous agreement of all the licensees. Lewis did not press this point. He did, however, suggest that we have a maximum royalty on a per million unit basis such as 50¢ or 75¢. He thought that the spread between 15¢ and 80¢ or 90¢ was too great. No final decision was reached on this matter of a maximum amount. In this connection we further pointed out that a reduction in Foundation income from present products would necessitate a higher rate on a per million unit basis for the new products in order to make up the loss to the Foundation, inasmuch as the Trustees were not willing to make this modification

Digitized by Google

unless the present income from the pharmaceutical group was at least increased slightly.

It was mentioned during the discussion that when Delsterol is combined with dried milk powder there is a 20 to 40 per cent loss in D potency.

It was the opinion of both Lewis and Dr. Anderson that the Foundation should think in terms of a maximum of 15¢ per million. They did indicate that a difference of one or two cents might not be sufficient to determine their decision. Lewis said that the figures he gave us in Jan. on their natural D consumption were based upon label claims and not upon the actual amount of D used in these various products.

We explained to them our program of determining the new royalty and sending out a letter on the subject announcing the new royalty without calling a meeting of the licensees, and we explained why we did not wish to call a meeting. Neither Mr. Lewis nor Dr. Anderson expressed any opinion on this procedure and merely indicated that it was the Foundation's problem. They implied that they did not object to this procedure.

When we told them that Parke Davis was proceeding immediately with one product on our assurance of a royalty of not greater than 22¢ a million, Lewis indicated that Squibb had one product, not mentioning which product, that might require rather rapid action if a change were to be made.

A Directors meeting of the Squibb Co. was scheduled for today, February 23, and it was indicated that this matter would be brought up at the meeting. Lewis is to call us and advise us what the Squibb Co. will do at the 15¢ royalty figure. If we do not hear from him by Tues, we are to call him for further details.

HIGH POTENCY VITAMIN D

We outlined the high potency D situation both with respect to Merrell and Winthrop. Their reaction was first that Squibb would have no objection to Merrell's continuing to sell its concentrated viosterol if we could line up Merrell on its regular viosterol from the standpoint of container size and price. We indicated that this latter could be accomplished. Secondly, Dr. Anderson expressed the thought that we might limit this proposition to a specific product of a specific potency such as a 50,000 unit capsule. This means that Parke Davis, Squibb and Winthrop have definitely committed themselves as not objecting to allowing Merrell to proceed. Abbott has not as yet made up its mind.

AMA PATENT CONFERENCE MARCH 16

Dr. Anderson asked if the Foundation had received an invitation to this meeting, and we replied that we had and Dr. Steenbock had received one too. He said that he had been invited to speak on the program along with Dr. Leschier as representing the manufacturers on the subject of the wisdom of medical patents from the standpoint of public welfare. He indicated that one of the reasons for calling this conference as he had heard it, was that the AMA is somewhat concerned about the large number of medical patents being taken out by University laboratories. He stated that it was his opinion that as long as the Foundation had been invited to attend that we could not very well stay away, even though an attack might be made on the Foundation at the meeting. He also felt that he could not very well refuse the invitation and Dr. Leschier felt the same way. This is interesting in view of Dr. Steenbock's comment expressed to Barney on February 21, wherein he thought the Foundation should not attend in any official capacity, but that he, Steenbock, would go merely as an observer and if called upon to speak he would present his views on medical patents, as representing his personal opinion and not the policy of the Foundation.

APRIL 21, 1936.

Dr. H. L. RUSSELL,
Wisconsin Alumni Research Foundation,
Madison, Wis.

DEAR DOCTOR RUSSELL: Enlosed find the following vouchers covering royalties as per statements attached·

Voucher No. 40537	$536. 88
Voucher No. 40536	1, 748. 39
Voucher No. 40535	3, 416. 85
Voucher No. 40534	10, 837. 51

A total of $16,539.65.

Digitized by Google

In view of the lack of protection which we have at the present time on the trade name "Viosterol," as well as on the patent, we feel very strongly that the royalty should be reduced, or at least until such a time as we and the other licensees are afforded the protection which we once had.

We are paying 10-percent royalties on no other license arrangement; in fact, the limit has always been 5 percent.

It was argued by your trustees that under our arrangement with the Foundation we were given certain benefits of price stabilization which was well worth the additional 5 percent. Since that time both the price structure and patent situation has apparently collapsed.

How long will it be, in your opinion, before we can expect an adjustment in the royalties?

Yours sincerely,

S. DE WITT CLOUGH, *President.*

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis., August 17, 1936.

Dr. CARL NIELSEN,
Abbott Laboratories, North Chicago, Ill.

DEAR MR. NIELSEN: I wish to acknowledge receipt of your letter of August 14, which refers to the manuscript I sent you some time ago entitled "Study of the Comparative Therapeutic Value of Two Viosterols" by Drs. Smith and Owens of Howard University.

Dr. Volwiler has already given me his opinion on this work, and I believe you are familiar with the comments of Dr. Anderson, of E. R. Squibb & Sons. With reference to response from Dr. Cox, of the Mead Johnson Co., I may say that Cox conferred with Mr. Larson, and he held much the same opinion as the balance of the committee in that publication of this article should be discouraged and in the event that it was published, it would be necessary to drastically revise the contents of the manuscript. From the outset, of course, we have been opposed to publication of this paper in any from. We have advised Dr. Smith that it was necessary to get the opinions of the pharmaceutical committee, and we intend to confer with them in the near future advising them that publication of the work is not desirable.

With reference to the data contained in this paper and future clinical trials, I agree with the statements made in your letter and hold the same opinion that you do in regard to very careful checking by different investigators as being essential in order to bring out apparent differences. It certainly is a fact that no good would result from the publication of the work of Smith and Owens.

Thanking you and with best wishes, I am

Sincerely yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
HENRY F. SCOTT,
Director of Biological Research.

JULY 6, 1936.

To: J. F. A.
From: A. W. L.
Copy: S. D. C.

I have a copy of your letter of June 30, addressed to Dr. Henry T. Scott, and concerning comparative studies of two viosterols.

Presumably the products in question are material made under the Steenbock process and that prepared by the American Mills subsidiary.

If this article is published the Steenbock group are certainly in the position of being hung with their own rope. I should like to see the publication suppressed but am pretty certain that Mead Johnson will see that it is published since they are no longer vitally interested in viosterol. Certainly anything that can be done to delay publication would be advisable.

Very truly yours,

S. D. C.: A copy of the J. F. A. letter was sent to Mr. Nielsen.

Study of the Comparative Therapeutic Value of Two Viosterols[1]

(By Alonzo deG. Smith, M. D., and Nolan A. Owens, M. D., Washington, D. C.)

[This study was made possible by a grant from the Wisconsin Alumni Research Foundation, March-June 1936]

INTRODUCTION

For some time viosterol has been manufactured according to a method devised by Dr. Harry Steenbock of the University of Wisconsin. This viosterol is made by irradiation of ergosterol in oil by ultra-violet light. This product has proven efficacious clinically. Recently a new viosterol was put on the market and defined as "activated ergosterol in oil" and made by exposure of the ergosterol to the cathode rays. We are not familiar with any clinical studies showing the therapeutic value of this preparation. Accordingly we set ourselves the problem of making a comparative study of the two viosterols.

We hospitalized twenty-two Negro infants between the ages of three and twenty-eight months showing various degrees of rickets, the criterion being a roentgenogram of the wrists. Each child was put on a diet suitable for its age and weight, all antirachitic substances being excluded except the test material. They were under the exclusive care of six graduate nurses and the writers. They were kept indoors during the period of study. An observation period of eleven to twenty-two days was instituted, during which time at least two X-rays and two Ca and P determinations were made. No case showed healing by X-ray at the time therapy was begun. They were weighed at frequent intervals and the TPR recorded daily.

A history, physical, urinalysis, and blood count was done on each. All had negative Wassermann and Mantoux tests. Measurements of length, circumference of head, chest, and sitting height were recorded on each at the beginning and at the end of the study. The twenty-two were divided according to age and degree of rickets as nearly as possible with our limited number. Each group of eleven was confined to one side of the ward. One group was given Squibb's viosterol, the other that put out by the American Pharmaceutical Company.

It was decided that for the experiment to be critical, we should use a viosterol unitage low enough to produce healing but not necessarily complete cure in the allotted six weeks of therapy. Conferences with Doctors Cox, Martha Elliott, L. Emmet Holt, Jr., and Nelson, suggested a unit range between 1,000 and 1,200 U. S. P. Despite the fact that all of the babies were Negroes which might suggest a need for a high minimum unitage, the writers finally decided that 800 units per day would be effective.

The therapeutic period was forty-two days, during which time each child had a weekly X-ray of the wrists and Ca and P determinations, the first, second, fourth, and sixth week.

Originally we started with eleven children in each group. About midway of the study, two mothers of babies of the Squibb group exerted pressure to have their babies removed despite our strong protest.

RESULTS

Roentgenograms.—For purposes of comparison the X-rays were divided into mild, moderate, and severe rickets. Charts 1A, 1B, 1C are self-explanatory. We were concerned with the degree and rate of healing.

Our interpretation leads us to believe there was no difference, i. e., the rate and degree of healing in the cases given APC viosterol was equal to that of those given Squibb's viosterol. In the case of J. S., severe rickets with no evidence of healing after four weeks, we believe the explanation that for him 800 units was insufficient to produce healing is tenable.

Ca and P Studies.—In general the Ca and P values do not show any significant difference in the total change in each group. This is shown in Tables 1A, 1B, and Graph I–IX the latter being an average of the series.

[1] From the division of pediatrics, school of medicine, Howard University, and Freedmen's Hospital, Dr. Smith, associate professor of pediatrics; Dr. Owens, resident in pediatrics.

Digitized by Google

The irregularity in Ca of PA (Graph I) and to a less extent of phosphorus may be explained on the basis of individual variation. During the last two weeks P. A. had pneumonia; the graph shows the calcium rose slightly and the phosphorus dropped but neither change is marked. There were no other clinical disturbances that appear related to other variations in the remaining graphs.

Nutritional Status.—The weight, general appearance, measurements of the head, chest, length, and sitting height showed increase and improvement in all of the children. These measurements were not greater or more significant than would be expected for the two months' period of study, and cannot be related to the administration of either viosterol.

CONCLUSION

A comparative study of nine cases of varying degrees of rickets receiving 800 U. S. P. units of Squibb's Viosterol daily with eleven comparable cases receiving 800 U. S. P. units of American Pharmaceutical Company viosterol shows no significant difference in rate or degree of healing as determined (1) by X-ray of the wrists and (3) Ca and P determinations on the blood.

(Signed) ALONZO DEG. SMITH, M. D.
NOLAN A. OWENS, M. D.

CHART 1A.—*Comparison of X-rays—mild rickets*

Group	Viosterol	Name	Film 1	2	3	4	5	6	Conclusion
1	SQ	P. A. 4 mos.	Definite evidence of healing in both. The rachitic process is more marked in A. E. hence the extent of healing appears greater.	Progressive healing is present. The degree and rate continue at the same level.	The increase in healing continues. No significant difference is observable in the two films.	The rate and degree of healing are progressive and to an equal degree.	The course continues at the same rate.	The rate and degree of healing have been progressive and equal.	Greater evidence of healing is present in A. E. because of the more marked process. Rate and degree are about equal.
	AP	A. E. 18 mos.							
2	SQ	M. J. 9 mos.	Mild rickets present in both, slightly greater in M. J. Healing has begun in both to the same extent.	Progressive healing in both at about the same rate but the degree is greater in M. J.	The increase in calcium deposition continues in both with M. J. showing the more obvious change.	Comparison continues as before with progressive repair of the rachitic process.	Healing continues in a similar manner.	The total change is greater in M. J.	The rate and degree of healing appear equal, though the total change is more obvious in M. J.
	AP	E. H. 5 mos.							
3	SQ	M. W. 5 mos.	Definite healing in the three with the total change a little greater in W. H.	Healing continues with the relative degree and rate being the same.	Increased healing in all to the same extent.	No difference noted in the three films as healing increases.	The progress is the same in all.	Comparison of degree and rate of healing reveals us important differences.	No difference is appreciated as regards rate and degree of healing.
	AP	D. P. 6 mos.							
	AP	W. H. 7 mos.							

CHART 1B.—*Comparison of X-rays—Moderate rickets*

Group	Viosterol	Name	Film 1.	2	3	4	5	6	Conclusion
4	SQ	S. S. 14 mos.	Beginning healing in both. The degree of rickets is slightly greater in S. S.	Continued healing with us obvious differences in the two.	Progressive repair of the rickets the same extent.	No apparent differences in calcification as the process continues to heal.	Healing continues. The rate and degree are the same in both.	The healing has continued progressively and equally in both.	There are no differences noted as regards the rate and degree of healing.
	AP	E. H. 16 mos.							
5	SQ	S. B. 13 mos.	Healing is very slight in both.	Repair of the rachitic process is more evident but no differences are appreciated.	Progressive healing to the same extent in both.	No difference in the healing rate and degree as it continues.	The course is progressively better at the same rate and to the same degree.	Equal healing in both which continues as before.	No difference in the rate and degree of healing.
	AP	B. B. 13 mos.							
6	SQ	H. P. 10 mos.	Repair of the process has begun in all to the same degree, with a slight increase in E. G.	Healing continues. No appreciable difference in rate and degree.	Healing is progressive and to the same extent in all.	No obvious difference as repair of the rachitic process continues.	Progressive repair with the rate and degree the same in all films.	No differences in the total healing.	There is no disparity in the rate and degree of healing.
	AP	V. D. 11 mos.							
	AP	R. L. 19 mos.

PHOTOGRAPHS

By way of illustrating our interpretations of X-ray films we include a photograph of the X-ray (positive) of the wrists of three groups of two children each from the mild, moderate, and severe classification, one picture taken at the beginning of the study and the other after the six weeks' period of therapy, 12 photographs in all, plus a picture of the wrist of each of the six children. The photographs should be compared according to the scheme following:

Mild

(1) Sq—0—M. J. Compare with AP—0—E. H. (3)
(2) Sq—6—M. J. Compare with AP—6—E. H. (4)

Moderate

(1) Sq—0—S. S. Compare with AP—0—E. H. (3)
(2) Sq—6—S. S. Compare with AP—6—E. H. (4)

Severe

(1) Sq—0—C. B. Compare with AP—0—D. R. (3)
(2) Sq—6—C. B. Compare with AP—6—D. R. (4)
Note: Also, in each group compare (1) and (2); (3) and (4).

ADDENDA

I. Photograph of Staff.
II. Photograph of Ward at Feeding Time.
III. Fourteen pictures of typical children and wrists.

YEAST RESIDUE FROM ALCOHOL PLANT

Mr. F. A. CANON:
(Attention Dr. J. Waddell)

I note your report of June 6, covering the week ending June 6 as well as a copy of your memorandum to Wm. F. Krug Jr., at the alcohol plant.

According to my reading of the contract with Wisconsin Alumni Research Foundation, we are not at liberty to use yeast in conjunction with irradiated ergosterol, this field being reserved exclusively to Fleischmann. In view of this fact I do not think we ought to waste time or money on experiments in connection with yeast.

———— ————,
President.

JANUARY 6, 1937.

Dr. H. W. ELLEY,
Associate Chemical Director,
Organic Chemicals Department, Wilmington, Del.:

MEETING IN MADISON WITH MEMBERS OF THE FOUNDATION

I visited Madison on my recent trip to the West and discussed matters of mutual interest with the Wisconsin Foundation, particularly the subject of further clinical tests.

I met Dr. Scott first and in order to clarify his ideas we again went over the reasons for our believing that 7-dehydrocholesterol is the provitamin of commercial cholesterol. Dr. Scott brought up the matter of our request that Philips No. 1 material be included in some preliminary trials at Detroit. He mentioned that in presenting this matter for the consideration of the Foundation trustees they might wish to know the identity of Philips No. 1 material before authorizing expenditures on clinical investigation. He also foresaw the possibility of an investigator such as Dr. May wishing to know the identity of the material which he had tested before publishing any results obtained with it.

Later we saw Russell, Barney, and Ross of the Foundation and my impression is that this group would prefer to have the patent situation, as regards 7-dehydrocholesterol, further clarified before they would actively sponsor before the board of trustees any program of expenditures for clinical studies.

Digitized by Google

They inquired as to my opinion of the British patent 454,260 recently granted to I. G. on the preparation of 7-dehydrocholesterol. They told me that the British licensee, Glaxo, had opposed this patent in Britain until I. G. had acknowledged that Steenbock's irradiation process was basic to it.

The Foundation is very much interested in the coming vist of Professor Hörlein and our conference with him and the Winthrop people. They would like to sit in on the conference as soon as we think it is propitious for them to do so.

Later Dr. Scott and I discussed with Dr. Steenbock the matter of further clinical trials particularly on 7-dehydrocholesterol. Dr. Steenbock, while not committing himself directly, is apparently willing to accept 7-dehydrocholesterol as the physiological provitamin. However, his reaction to the situation was that the wishes and viewpoint of the pharmaceutical licensees should be considered before deciding whether the Foundation should spend any considerable sum of money in further clinical work. He mentioned that most of the pharmaceutical licensees had not been interested in obtaining rights to the manufacture of crystallin vitamin D (from ergosterol) and that the present situation might find them with the same attitude. He admitted, however, that if the patent situation and licensing arrangements worked out so that the five pharmaceutical companies were again in a position of having an exclusive hold of the synthetic vitamin D field that undoubtedly they would be very much interested.

ADDITIONAL NOTES

The Wander Co. (Ovaltine) are establishing a new biological department and have hired Dr. Haman as Director of this new work. Haman got his training in Steenbock's laboratory and has been in the Foundation laboratory for approximately the past year. Apparently arrangements have been made with the Foundation to put vitamin D in Ovaltine and I understand that the Wander Co. have been obtaining their vitamin D from Fleischmann.

I learned that American Research Products, Inc. (General Mills subsidiary which sells vitamin D) are selling a vitamin A concentrate prepared by Hickman's distillation process from fish oils. Hickman is with Eastman Kodak. I think the above development is the main reason for General Mills obtaining rights to the molecular distillation process a year or so ago.

BIOLOGICAL LABORATORY,
J. WADDELL, *Director.*

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis., August 24, 1936.

ABBOTT LABORATORIES,
MEAD JOHNSON & Co.,
PARKE, DAVIS & Co.,
E. R. SQUIBB & SONS,
WINTHROP CHEMICAL Co.

GENTLEMEN: We have recently been approached by Dr. D. H. Shelling, of Johns Hopkins University (work to be done at the Jewish Hospital of Brooklyn), in the matter of supporting clinical investigations on viosterol emulsions. Preliminary evidence has indicated that viosterol in the emulsified form is more efficacious and better utilized than viosterol in oil.

The plan of the experiment is to follow the work through for a period of at least 1 year, making mineral balances, blood studies, and phosphatase studies, with the hopes that in the investigations as planned some facts may arise which will make it possible to understand better the mechanism which governs the action of vitamin D. It has also been planned to secure electrocardiograms before and after vitamin D therapy. A study such as this will also entail the usual number of serial X-rays, and the plan is to conduct the study on normal full-term and premature infants.

Naturally the question arises whether such a study would be of practical importance to all of our pharmaceutical licensees. We are hardly interested in the prosecution of problems of a purely scientific character that comes to us from outside institutions. Nevertheless, if this is a problem that has definite commercial possibilities, we should not make a hasty adverse decision.

Sincerely yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
H. L. RUSSELL, *Director.*

REPORT ON CONFERENCES WITH DEAN RUSSELL AND MR. WARD ROSS, OF THE FOUNDATION, IN CHICAGO, EARLY IN FEBRUARY 1935

Present: Dean Russell, Mr. Ross, Mr. Nielsen.
The following subjects were discussed:

1. The Sperti Patent.
2. Highly Concentrated Viosterol for the Treatment of Asthma and Hay Fever.
3. Foundation versus Breon case.

SPERTI PATENT

The Foundation wrote to Wm. S. Merrell & Company, Cincinnati, Ohio, on December 20, 1933, stating that the Sperti patent issued in 1928 is an infringement on Steenbock's patents. Merrell answered on January 8th, 1934, and referred the Foundation to the General Development Laboratories, Inc., 250 Park Avenue, New York (Mr. J. S. Prescott). On January 22nd the Foundation acknowledged Merrell's letter and wrote to the General Development Laboratories, Inc. No answer has been received. The General Development Laboratories, Inc. is a subsidiary of General Foods, Inc., New York.

Since General Foods and Merrell apparently consider it safe to proceed with manufacture by the Sperti process, Mr. Nielsen suggested that the Foundation requests its Washington representatives to inquire whether other patents have been granted to Sperti since 1928. Abbott Laboratories will also investigate.

It was also decided that Doctor Volwiler should approach Doctor Leech unofficially to discover whether Merrell has submitted the product and whether they have been permitted to use the name "Viosterol." If the Council has a sample package of the product, we may be permitted to see it and perhaps examine it.

Dean Russell asked us to attempt to procure packages of the Merrell product and submit one to the Foundation.

VIOSTEROL CONCENTRATE

Dean Russell asked for advice as to how to proceed in order to satisfy the demand from various hospitals and clinics for Viosterol Concentrate for clinical investigation. The Foundation is anxious that it should be made available because reports have been submitted indicating that it is highly beneficial in severe cases of asthma, hay fever, and arthritis. One licensee has suggested that it be put up in gelatin capsules. The product used by Doctor Reed of the University of Illinois is 100 times the potency of the commercial product.

Mr. Nielsen remarked that the price, in order to conform to that of Viosterol in Oil, would be very high—probably $3.00 per capsule, and that the daily dose suggested in certain cases would cost the patient $15.00 to $16.00.

Dean Russell said that the price would have to be materially lower, but that the treatment, even so, would be an expensive one. This, however, would not bar its use; many cases would be willing to pay $150 to $200 for relief or recovery.

Mr. Nielsen stated that if the capsules were priced considerably lower than the commercial product unit for unit, nothing would prevent the hospitals from opening the capsules and diluting the content with vegetable oil to obtain a "250 D" solution far below the regular cost.

Dean Russell asked for suggestions to prevent this. Mr. Nielsen stated that Abbott Laboratories would give further thought to this problem. Tentatively, he suggested that the concentrate might be denatured by the addition of a drug also indicated in these cases—Ephedrine, for example—that the product be considered as a drug, not a vitamin, and that it be distributed for clinical trial under a special name—all provided that the licensees agree. Any untoward effects from it thus would not reflect on the Viosterol products on the market.

FOUNDATION VERSUS BREON CASE

Dean Russell stated that the case will come up for trial on February 21st and 22nd. Mr. Hobbs will study the case upon his return from the East, and will keep us posted on developments.

CARL NIELSEN.

February 13, 1934.

MADISON, WIS., *February 27, 1933.*

ACETOL PRODUCTS, INC.,
260 W. Broadway, New York City.

DEAR SIR:

SNIDER CORPORATION ERGOSTEROL

In my conference with you and Dr. Waddell about January 13, I called your attention to the difficulty which we were then having with the Snider Packing Corporation regarding the inadequacy of the Vitamin D content of their treated tomato cocktail. Dr. Waddell has been furnished with the results which our Dr. Scott (head chemist of our Control Laboratory) has secured in his bioassays of samples of Snider's tomato cocktail, as well as the ergosterol solution which had been shipped to them by you.

In order that you may have all of our analytical data together, we enclose summary of same. Original examination of Snider's tomato pack made with both consignments of your irradiated ergosterol labeled 1349 and 1360 showed a deficiency in vitamin D content in the tomato product. Dr. Scott secured, at Albion, New York, a sample of Acetol's ergosterol 1349 in corn oil ethyl acetate solution. This was labeled as containing 29,586 rat units per cc. Scott's bioassay showed that there were about 9,860 rat units per cc.

Subsequently, Scott asked for another sample of your 1349 solution and on October 31, 1932, he received from your company a batch labeled No. 197 in corn oil which it was stated was used in the preparation of the ergosterol solution No. 1349. This concentrate (No. 197) labeled as containing 250,000 rat units per cc. was found up to the ascribed potency.

Later, on January 18, Dr. Scott received another small sample of batch No. 1349 in corn oil ethyl acetate solution from Dr. Waddell which was stated to be a composite of the earlier shipments which were sent to Snider. Biological assay of this new sample was made. This sample, however, was unmarked as to potency but in view of the fact that it carried the same No. 1349 as the first batch sent, we assumed that it contained 29,586 rat units per cc., but Dr. Scott found only about 9,860 rat units per cc. the same as the original sample received in September.

Examination of the Acetol No. 1360 ergosterol in corn oil ethyl acetate which was also used by the Snider Corporation in their pack in September (labeled to contain 29,586 rat units per cc.) was found to contain approximately 15,000 rat units.

Following the suggestion which was made at our New York conference in January it was then agreed that Scott and Waddell would exchange batches of the original solution for retest and in January Dr. Scott received from Dr. Waddell new samples of Nos. 1349 and 1360. The results of this last bioassay of No. 1360 confirm the earlier findings and show that this second sample also contained only 15,000 rat units per cc. the same as had been found earlier.

It would seem obvious that the ergosterol solution as sent to the Snider Corporation was, therefore, deficient in potency when compared with the label on the container.

CARNATION MILK CO. (OCONOMOWOC)

Owing to the interest of the Carnation Milk Co. of Oconomowoc in the possibility of incorporating vitamin D in their evaporated milk through the addition of irradiated ergosterol this office had suggested that they secure a sufficient quantity of irradiated ergosterol from your company in order that experiments might be made therewith. The Carnation Co. carried out a series of experiments with this ergosterol solution which was a concentrate in corn oil only and which was labeled to contain 250,000 rat units per cc. Samples of the treated Carnation milk, as well as some of the original irradiated ergosterol solution were submitted to this laboratory for bioassay. Dr. Scott found upon duplicate analyses of the ergosterol solution with ten rats on a given level, that it had a potency of 125,000 rat units per cc. Also the samples of evaporated milk were found to contain only one-half of the reputed potency which was based upon a careful dilution of the milk with a requisite quantity of ergosterol before being processed. These two incidents coming one on top of the other so closely have perturbed us very much, as it is obvious that the whole matter of the use of irradiated ergosterol in food products will be quickly brought into disrepute unless there can be positive assurance that the potency of the irradiated ergosterol purchased by our licensees will be fully up to labeled standard. In consequence, of our difficulties with the Snider Packing Corporation, they are so thoroughly discouraged with their efforts to use irradiated ergosterol that they are now seeking to abrogate their entire contract.

Digitized by Google

Our inability to unravel this matter satisfactorily from a technical point of view with your research laboratory makes us feel important to offer to the Snider people any solution of the present difficulty. Dr. Waddell had earlier suggested that the difficulty may possibly have occurred because of the mixture of the corn oil solution of ergosterol in an ethyl acetate solution. In this connection may we say that earlier Snider secured some ergosetrol from the Fleischmann people which was shipped in corn oil-ethyl acetate solution. This was found to be wholly up to standard as labeled.

Also bear in mind that the ergosterol shipped to the Carnation people was in corn oil only and this was found to be much below standard. It, therefore, seems to us that the ethyl acetate theory cannot be regarded as tenable.

The foregoing difficulties raise in our minds two suggestions which we now desire to lay before you.

SUGGESTIONS BY THE FOUNDATION

1. That in case of shipment by you to our respective licensees of any considerable quantity of ergosterol there be sent to our control laboratory a sample of sufficient size of said ergosterol ready for shipment to be used by us if advisable, in rechecking the potency before it is finally put into the commercial product. We recognize that the time element in the case of Snider was not sufficient to have this done at the outset, but we hope by taking the necessary precautionary measures in the future to prevent a recurrence of this very unfortunate incident.

2. We have gone over the license agreement between Acetol Products, Inc., and the Wisconsin Foundation and find, unfortunately, that there is no clause in the existing contract in which standard potency of the irradiated ergosterol sold by your company is guaranteed. We recognize that this omission perhaps relieves you from any legal responsibility so far as the foundation is concerned, but we believe that the importance of these two incidents which have occurred this year demonstrate the necessity and wisdom of insuring the foundation, as well as its licensees against a repetition of this situation.

It would be most unfortunate if any publicity was to occur as a result of the reduced potency of the Snider product for it would not only ruin the Snider business in this rpoduct, but would reflect most disastrously upon you, as well as ourselves. If the Government were to discover this situation and publish the results, it would do irreparable injury to the whole vitamin D situation in foods. We are, therefore, extremely anxious to approach the future in a way so that it will make impossible a repetition of this experience.

We recognize, in the matter of bioassay, the difficulty of exact duplication of analyses being secured when being made in different laboratories by different men, but we have used every possible means of checking the samples which have been in our possession to eliminate any variation incident to a single analysis, and in view of the fact of the very large number of analyses of a similar character that are conducted constantly, we believe that the results as reported by Dr. Scott must be taken as final so far as we are concerned.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
H. L. RUSSELL, *Director*.

MARCH 1, 1933.

Dr. H. T. SCOTT,
Chemist, Wisconsin Alumni Research Foundation,
Madison, Wis.

DEAR SCOTTY: Some days ago I received your letter of February 17 in which you report your findings on the samples of Snider shipments Nos. 1349 and 1350 which I sent you. The fact that your assays of these two samples do not agree with ours suggests that a difference in technique of the two laboratories may have some bearing on this matter. So far the batch concentrate No. 197 seems to be the only assay on which we agree. I wish, therefore, that you would write me, describing rather fully, the procedure which you have followed in diluting the various corn oil-ethyl acetate samples.

In reporting my findings on the samples of Nos. 1349 and 1360 which we had here I have described briefly the technique which we used. In each case there was made a first dilution in corn oil and a second dilution in ether. This is the practice which we always follow in this laboratory whever it is possible with materials of high potency. Ether dilutions are made with fresh distilled ether and only

Digitized by Google

on the day on which they are to be used. After making up rations the ether dilution is discarded and fresh ether dilutions made from the first oil dilution as they are required for later tests.

I may say that some preliminary tests which we have made on the sample of No. 1360, taken from the supply in Snider's possession and which we received from you a short time ago, indicate that this sample will show a considerably higher potency than you have found in your tests. I am unable to speak definitely about this sample, however, until further tests have been completed.

With kind regards, I am,

Yours sincerely,

J. WADDELL,
Director, Biological Laboratory,
Acetol Products, Inc.

MARCH 2, 1933.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis.

(Attention of Dean H. L. Russell)

GENTLEMEN: We acknowledge at once your letter of the 27th and you can expect to hear from us on the various subjects mentioned in this letter as soon as we have had an opportunity of doing some investigating and discussing these matters in our own organization.

Cordially yours,

ACETOL PRODUCTS, INC.,
_____,
Sales Manager.

WINTHROP CHEMICAL CO.,
February 8, 1939.

Winthrop Chemical Co. requests consideration of massive V. D. dosage and parathyroidprivic tetany.

Conference with Drs. Steenbock and Scott relative to H. G. Bertram's request for consideration. Steenbock is of the opinion that in view of the fact that vitamin D is no longer a distinctive Steenbock product but can be secured from a variety of sources that the foundation might as well favor the commercialization of high dosages unless there is very serious objection on the part of the A. M. A. officials toward a move of this sort.

It was deemed inadvisable to approach Dr. Leech of the Council on Pharmacy and Chemistry, directly and ask for the A. M. A.'s judgment in regard to this matter. It was thought preferable that some prominent who is close to the council such as Dr. Barr, of Washington University, might be the point of first contact and it was agreed that Dr. Scott would contact Barr within the next 2 or 3 weeks.

Russell wrote Bertram, of Winthrop, that the matter was under advisement and was now in the process of contacting the A. M. A. officials and that the foundation would give Bertram the results of these contacts as soon as was practicable.

Russell further spoke of the fact that W. S. Merrell & Co., of Cincinnati, are now selling a massive dose preparation and that in connection with the adjustment of the General Foods amended contract it was highly desirable to get this Merrell situation composed at as early a date as possible.

Suggestion was made that although Merrell's sales of high potency vitamin D were quite small still this matter entered into consideration of the situation in connection with the settlement of the General Foods supplementary contract.

Scott was supplied with copy of Winthrop's compilation of data made in July 1938 relative to the somewhat equivocal results obtained in the use of high potency vitamin D in cases of arthritis and psoriasis.

H. L. RUSSELL.

Subject: Wisconsin Alumni Research Foundation.
To: Wilmington office.
From: New York office.
Date: March 2, 1933.

Enclosed is a copy of the foundation's letter of February 27 and our acknowledgment of same.

I have discussed this matter briefly with Dr. Waddell by phone and have sent him a copy of the foundation's letter.

Dr. Waddell's letter of March 1, together with his various letters to Dr. Scott and the Snider Packing Corporation's letter of February 24, will give you a pretty complete picture.

I am of the opinion that the foundation is trying to evade any responsibility or expense in these matters and while I realize that Dr. Waddell is not infallible I am inclined to think that his assays would be more nearly right than anybody else's and that the potencies claimed by us are correct within certain tolerances.

Please let me know what you wish done further in this matter.

S. A. ATKINS.

JANUARY 25, 1937.

A conference was held in New York City on January 22nd to discuss the Vitamin D situation with representatives of the I. G. It was attended by Prof. Horlein, Dr. Duisberg, Dr. Weiss, Mr. Bertram, Dr. Hiemens, Dr. Stockman, Mr. Protto, Mr. King, Dr. Waddell, and the writer. At a preliminary conference held on January 14th it had been indicated by the I. G. representatives that they were very anxious to set up some type of working arrangement with duPont in the Vitamin D field. This conference was largely devoted to a discussion of the scientific developments incident to the discovery of the various Vitamin D products which are now known. Dr. Horlein was particularly interested in discussing Dr. Waddell's developments; our relationships with the Wisconsin Alumni Foundation; the importance of the Milas electrodeless discharge method for converting provitamin to Vitamin D and our relationships with the Philips Company of Holland. It seemed evident from the conversation that the Germans believed it possible that the Waddell patent covering the action of oxidizing agents on cholesterol might have a bearing on the Windaus method for making 7-dehydro cholesterol, and they asked for the reaction product resulting from the use of Dr. Waddell's patented conditions. We said we would take this under advisement but were not in a position to make a decision. They also asked us definitely what the cost was for Philips Vitamin No. 1. We told them we were not in a position to answer this question.

With this previous conference as a background, the conference on January 22nd was for the purpose of making definite suggestions for cooperation in the Vitamin D field. Mr. Weiss, as before, led the meeting and stated at the outset that they were very anxious to set up a working arrangement with duPont because the Bayer Semesan matter had worked out quite satisfactorily and they would like to set up something similar in the pharmaceutical field. His definite proposition was that duPont give the Winthrop Chemical Company the first right to exploit all duPont pharmaceutical developments on an exclusive basis. In return, Winthrop would give duPont an exclusive free license for Vitamin D in the poultry field. Profits on duPont pharmaceutical developments would be split 50–50.

Mr. Protto advised Mr. Weiss that the duPont Company had some prior commitments in the pharmaceutical field with Abbott Laboratories and the Eli Lilly Company and it would be necessary to carefully consider our arrangements with these companies to determine whether or not we were free to deal with Winthrop in this field. It was pointed out that interests in the duPont Company other than in the Organic Chemicals Department would have to be considered before a definite answer could be given.

Digitized by Google

A general discussion ensued in which Mr. Protto outlined at some length the du Pont position in the Vitamin D field. The du Pont rights under the Wisconsin Alumni Foundation were given in detail and the Waddell developments, as well as the Milas patent application were cited to show that we have an important technical position in the field. From the commercial standpoint, it was brought out that we are able to exploit the Philips products No. 1 and No. 2 which we believe to be attractive commercially. Dr. Hörlein said that they had turned down the Philips No. 1 product and that they had not had an opportunity to consider the No. 2. Mr. Protto continued and pointed out that the method would probably be used which proved to be most economic. He felt that it would be preferable to deal with the Wisconsin Alumni Foundation since they could be of considerable value to the industry in policing and regulating matters. If, for any reason, such arrangements became unsatisfactory, it would then be possible to consider alternative procedures not involving the use of the Foundation patents, that is, we might commercialize the Milas process. Dr. Horlein intimated that they might not have to operate under the Foundation patents since the irradiation of a synthetic pure provitamin (7-dehydro cholesterol) might not be considered to be dominated as is the irradiation of naturally occurring sterols.

Dr. Stockman discussed the Wisconsin Alumni Foundation at considerable length and evidently feels that the Foundation developments have been based largely on the Windhaus work on Vitamin D, which was thrown into the pool. He felt that they should not be restricted to the pharmaceutical field on Vitamin D_2 (calciferol) and he also felt that the Foundation should not have given exclusive rights to du Pont with few exceptions in other fields and because of the I. G. development work on Vitamin D_3 (from 7-dehydro cholesterol), they should not be forced to operate within the narrow pharmaceutical field under their Foundation license.

At the first conference the writer asked concerning the stage of development of the Vitamin D_3 and was informed that it was only a laboratory process. At this conference, because they were making a definite offer, he again asked this question and very surprisingly was informed that the Windhaus process had been commercialized and that they were in a position immediately to offer the material in commercial quantities. Dr. Hörlein also stated that it could easily compete in price with cod liver oil which gives Vitamin D at $1.00 per standard unit. The writer then expressed the thought that, if we worked out some cooperative commercial development, the I. G. would be willing to supply us with technical information to assist in starting the manufacture in this country. He was informed by Mr. Weiss that Winthrop wished to do the manufacturing and that they would supply du Pont with their requirements in the poultry field. Mr. Protto stated that the du Pont Company was primarily interested in manufacturing and that we would expect to manufacture our requirements and hoped to be able to supply the American requirements of the Winthrop Chemical Company. It was obvious that there was a complete divergence of opinion on this point and nothing further was said except that if we manufactured we would hope to set up some arrangement whereby we would pay Winthrop a certain royalty on the net selling price and that this royalty might vary in amount depending on the price charged in the various fields.

Mr. Protto suggested the advisability of working out a three party arrangement including the Winthrop Chemical Company (I. G.), the Philips Company and the duPont Company. If this were worked out, all of the important developments in Vitamin D could then be correlated and the information of all three parties utilized and their interests taken care of on a basis consistent with their positions. This did not seem to appeal greatly to the Germans inasmuch as they had already turned down the Philips product No. 1 and since Dr. Hörlein stated that the I. G. controlled irradiation in Germany. If the German D_3 is the cheapest to manufacture, Philips would, of course, gain nothing from a three party arrangement unless they were permitted to manufacture this product in Holland and sell it in their trade outlets. This would probably conflict with German sales and it seems rather doubtful that a satisfactory three party arrangement could be effected.

Inasmuch as the Vitamin D arrangement seemed to be dependent on the broad pharmaceutical arrangements between duPont and Winthrop, I asked if they had any alternate proposal to make if we found that our prior commitments made it impossible for us to give them rights to our pharmaceutical developments. Mr. Weiss stated that such rights were quite important to them and if such were the case his proposals on the Vitamin D would, of course, be withdrawn and entirely new proposals, if any, would have to be made.

Digitized by Google

Apparently all of the points outlined above had been thoroughly discussed and no others were considered important so the conference was concluded with the statement that we would carefully consider their proposals and advise them in the near future concerning our position in this matter.

H. W. ELLEY,
Associate Chemical Director.

JULY 8, 1935.

Mr. L. D. BARNEY,
Wisconsin Alumni Research Foundation,
Madison, Wis.

DEAR MR. BARNEY: At the first opportunity the writer wishes to confirm the essential points discussed in our lengthy conference in New York.

The matter or the addition of vitamin D to fluid milk, we understand, will be temporarily laid aside until the foundation has had a chance to test one or two of the State laws by the method outlined by Mr. Rose. As the writer stated, it would be our preference that the foundation not take legal action against anyone, but since this action has been decided upon by the trustees, we will withhold further discussion of the subject until the whole situation is clarified.

We have discussed the advisability of our company promoting vitamin D bread throughout the country. This sort of a business is something for which we are not anxious, but, on the other hand, it might be best for everybody concerned if we tackled the job. We are making a careful study of this and would like to submit a definite plan for your consideration. If you have any fundamental ideas which must be a part of any plan we should like to have these now. This matter is having our immediate attention, consequently, we should like to have any instructions or suggestions at your earliest convenience.

We are pleased to know that you are favorably disposed to a reconsideration of our royalty payments. As the writer explained, we have spent a substantial sum of money in the development or irradiated cholesterol. As you know, Dr. Waddell's paper on this subject was published and we believe the findings thus disclosed will be beneficial to all licensees of the Foundation. In turn, we believe this will directly benefit the foundation. We are supporting further work on cholesterol in the poultry field ourselves, and all of the irradiated cholesterol for the clinical work is being supplied free of charge by us. We are also assaying the irradiated cholesterol and cod liver oil. If results verify Dr. Risdall's preliminary findings, our sales of irradiated cholesterol in the pharmaceutical field alone will be substantial. The three pharmaceutical Licensees intend to supplant irradiated ergosterol with irradiated cholesterol and you have figures showing the total sales over a period of years. In addition, we expect a substantially larger volume from the poultry field where irradiated cholesterol will be used as a vitamin D supplement in place of fish liver oils or fish liver oil concentrates. In view of all the facts and conditions, we believe that our royalty payment should be 5 percent of the total sales of either irradiated ergosterol or irradiated cholesterol, or both. As suggested, we believe this change should be made as of January 1, 1935. The only business on which we might base a minimum payment, which you suggested, is the R. B. Davis Co. business which amounts to approximately $5,000 a year. It is probable that this will be our only income from vitamin D for at least 6 months to a year. If, for reasons not apparent to us at the present time, it would be desirable to have a minimum payment based on 5 percent of this business, we have no serious objection, although we would much prefer to eliminate a minimum payment altogether.

The writer feels certain that you understand our desire and willingness to be considered as a part of the foundation. You know our desire to prevent the vitamin D field from falling into disrepute because of too many producers of various types of so-called vitamin D. We would much prefer centralized control in the hands of the foundation and you may count on us to support you even though, at times, we may have differences of opinion.

We hope the trustees will arrange to act favorably upon this request at an early date.

As we understand it, you have a definite need right now for a source of supply of irradiated ergosterol for the Canadian bakers and Spaulding. The writer briefly outlined at the conference what he thought our policy in this matter would

Digitized by Google

be. Believing, as we do, that the trustees will not favorably upon a change in our royalty payments and will consider us a part of the foundation insofar as it is practical to do so, we would be inclined to abide by your wishes in the matter of price. We regard $1.50 per 1,000,000 Steenbock rat units as being a fair price for irradiated ergosterol. We should like to record here our definite feelings against high royalty charges such as we understand existed in General Baking Co.'s original arrangement with National Foods. In addition, it is only natural that we would not care to commit ourselves to produce this exceedingly small amount of material over a long period. We have some definite ideas regarding total charges for royalty and control work, and we propose to submit these to you in the plan suggested in paragraph 3. These ideas are summed up best by the statement that we consider the original arrangement between National Foods and General Baking Co. as being detrimental to a widespread use of vitamin D in foodstuffs. Our plan will offer for your consideration, charges, exclusive of the cost of vitamin D, that we consider to be fairer.

I believe the foregoing briefly confirms all of the principal points of our discussion that need immediate attention.

With kindest personal regards.

Cordially yours,

E. I. DU PONT DE NEMOURS & CO., INC.

E. I. DU PONT DE NEMOURS & CO., INC.,
Wilmington, Del.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Chicago, Ill.

(Attention Ward Ross, Esq.)

DEAR MR. ROSS: This is to acknowledge receipt of your letter of February 12, 1935, informing us of two declaratory judgment suits which have been brought in the United States District Court for the Northern District of Illinois, in order to determine the extent of the patent monopoly under the Steenbock patents. In this letter you call our attention to paragraph 13 of the Acetol-Foundation agreement, and state that in the event these declaratory judgment suits are tried on the merits we would be called upon to share in the expenses incurred by you as defendant. While we are only too glad to cooperate to the fullest extent in assisting you to protect the licensed field we do not believe that under our agreement this cooperation entails upon us the obligation to bear a portion of the financial expense of these suits.

Article 13 of the agreement states that when protection of the licensed field requires you to sue infringers therein we shall bear a portion of the expenses of such suit. The declaratory judgment suits in question are, however, entirely outside the scope of article 13. They are not suits by you to enjoin acts of infringement within the licensed field. On the contrary, they are suits by a third party to determine just what constitutes an act of infringement in order that acts carried out by such third party will not violate the patented field. It was clearly not the intention of the contracting parties in entering into this agreement, or as set forth in the agreement, to bear the expenses of any suits other than those brought by the foundation as plaintiff to prevent acts of infringement within the licensed field. Since these declaratory judgment suits are entirely outside of such category we must reluctantly disagree with your contention and refuse to assume any obligation for expenses incurred by you in defending suits of this type.

With the exception of financial assistance we shall be delighted to aid you so far as reasonably possible in defending these suits. We would appreciate information concerning the conduct and the outcome of these suits. Moreover, if we can be of any assistance therein please do not hesitate to call upon us. In the event that my work permits me, I should be only too glad to assist you in the preparation and defense of these suits.

Very truly yours,

ARTHUR G. CONNOLLY,
Counsel for Acetol Products, Inc.

Wilmington, Del., February 20, 1935.

Re: Acetol-Wisconsin Alumni Research Foundation Agreements.

J. E. KUPPERIAN.

The foundation, in its letter of February 12, 1935, stated that two suits for declaratory judgments have been instituted in the United States District Court for the Northern District of Illinois. These suits are for the purpose of determining the scope and validity of the Steenbock patents, under which Acetol is licensed. In accordance with article 13 of the Acetol-foundation agreement, Acetol is obligated to share the expense of any infringement suits brought by the foundation upon the licensed patents. The aforementioned letter states that Acetol will be called upon to share the expense of the two suits referred to in the event that they are tried upon the merit.

It is my opinion that a fair interpretation of the agreement in question imposes upon Acetol the obligation to share the expenses of the declaratory judgment suits. It is true that article 13 of the agreement specifies patent infringement suits, and that declaratory judgment suits are not strictly patent infringement suits. The agreement is clearly to the effect that Acetol as a licensee will financially assist in protecting the entire licensed field. Patent infringement suits were specifically referred to because at the time of the agreement they were practically the only type of suit wherein the scope and validity of a patented field could be judicially tried. Declaratory judgment suits are of recent origin and were practically nonexistent at the time the original agreement was entered into. However, they affect the patented field in the same manner as an infringement suit, and to protect such field must be defended just as vigorously as an infringement suit must be prosecuted. In view of the aforementioned facts it is my opinion that a court in construing article 13 of our agreement would hold that our obligation was substantially to share the expense of protecting the field embraced by the claims of the licensed patents regardless of whether this field was jeopardized by the acts of an infringer or by a potential infringer bringing a suit for a declaratory judgment. The court would state that the reference therein to patent infringement suits was not mutually exclusive but was merely to point out one of several procedures whereby the foundation might be required to protect the licensed inventions, and wherein Acetol as a licensee must bear a share of the expenses of such protection.

Despite the fact that the preceding paragraph sets out my opinion in this matter, I would most certainly refuse to acquiesce in the demands of the foundation for the following reasons:

(1) The foundation has been merciless in beating out competition throughout the United States wherever such competition threatened to encroach upon the synthetic vitamin D field. As a result, there are numerous companies which will endeavor to silence the foundation by bringing declaratory judgment suits. If we assume the burden of sharing the expenses of the suits now filed it would establish a precedent which might be extremely costly to Acetol.

(2) If the plaintiffs in any of these declaratory judgment suits are successful in restricting or invalidating the Steenbock patents Acetol will benefit thereby since article 13 of the agreement specifies that Acetol need not pay royalties thereunder if the licensed monopoly is substantially injured by a judicial decree. Insofar as the decree places a restricted scope thereon, the field outside the domination of the foundation is thereby increased which should also benefit Acetol.

(3) Acetol has a good legal argument upon which to base a refusal to bear the expenses of declaratory judgment suits defended by the foundation, even though it is my personal opinion that this argument would not be sufficient to sway the decision of a court called upon to interpret the pertinent section of the agreement. This argument is to the effect that under our agreement with the foundation we are called upon merely to share in the expense of a patent infringement suit brought by the foundation to enjoin acts of infringement within the licensed field. A declaratory judgment suit is first of all not a patent infringement suit brought by the foundation, and secondly is not to enjoin acts of infringement, but on the contrary is to determine in advance just what constitutes an act of infringement.

I am attaching herewith a letter to the foundation embodying what I consider should be our position in this matter. This letter will not be forwarded until you have signified your approval thereto. Will you kindly inform me of your feeling in this matter as promptly as possible.

ARTHUR G. CONNOLLY

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis., September 28, 1940.

MR. GERALD HERRICK,
Department of Justice,
Anti-Trust Division,
Chicago, Ill.

DEAR SIR: Pursuant to your request, I am enclosing a tabulation of royalties received by the foundation on cod liver oil with viosterol, viosterol and drisdol for the period 1931 through the first half of 1940, inclusive. These figures have been taken from our records and are correct.

I want to call to your attention that sales of these three products in foreign countries except Canada (which are reported separately by our licensees), are included in the foregoing figures since our royalty reports from these licensees do not separate foreign and United States business. The volume of sales of the three products herein mentioned in foreign countries is, however, relatively small in comparison with the business done in the United States on these products.

In the pharmaceutical field, the three Steenbock licensed products above referred to are the only ones for which the foundation has ever established minimum prices. With reference to the food field, it has not been our general practicé to control minimum prices of our licensees. There are, however, certain minor exceptions to this policy. These are the following:

1. In the DuPont license there is a minimum price provision in connection with the sale of vitamin D in the bread field. For your information, the foundation's royalties from the sale of vitamin D bread in the United States are approximately $1,200 per year. Further, some months ago, the parties (DuPont and the foundation) agreed to delete this clause from the license agreement although documents to accomplish this have not yet been formally executed.

2. In our license agreement with S. S. Kovacs, the foundation has established the minimum selling price of the licensee's vitamin D concentrate for use in fluid milk. This is a small operation on which our royalties probably will not exceed $2,200 a year.

3. In our license agreement with Standard Brands, the licensee has an option to sell a vitamin D concentrate for use in fluid milk. If the option is exercised, the foundation has the right to establish minimum selling prices for the product. The option has never been exercised by the licensee, no royalties have ever been received by the foundation on this product since no sales have been made, and the foundation has never exercised the right to establish such minimum selling prices.

The foregoing relates to the establishment by the foundation minimum prices of Steenbock licensed products in the food and pharmaceutical fields. As I have told you there have been instances where the foundation has either established maximum prices for licensed products or has incorporated provisions in license agreements under the Steenbock patents prohibiting the licensee from increasing the price of its product by reason of the fortification of the product with vitamin D under its license.

I am also enclosing three charts as follows:

a. Royalties from United States pharmaceutical licensees 1930–39.
b. Steenbock patent income 1930–38.
c. Royalties from United States pharmaceuticals expressed in block graphs.

These graphs are made up from royalty figures taken from the books of the foundation and are correct.

The foundation's gross royalty income from the Steenbock patents in 1939 was $936,610.70. This figure has been taken from our books and is correct.

I shall be glad to furnish you any additional information on these matters if you desire it.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
———— ————, *Business Manager.*

Summary of royalties received by Wisconsin Alumni Research Foundation on cod liver oil with viosterol, viosterol-drisdol—1931 through first half of 1940, inclusive (accrual basis), September 28, 1940—Continued

	C. L. O.	Viosterol	Drisdol	Total
1939				
Abbott	$16.98	$1,494.73	----------	
Mead Johnson	2,950.25	6,685.65	----------	
Parke, Davis	108.54	3,720.02	----------	
Squibb	2,417.28	4,567.60	----------	
Winthrop	----------	221.97	$22,963.43	
Total	5,493.05	16,689.97	22,963.43	$45,146.45
1940				
Abbott	5.86	249.88	----------	
Mead Johnson	1,120.77	2,495.63	----------	
Parke, Davis	45.97	977.62	----------	
Squibb	700.26	1,628.35	----------	
Winthrop	3.80	27.00	9,258.05	
Total	1,876.66	5,378.48	9,258.05	16,513.19

NOTE.—As of January 1, 1937, royalties were reduced from 10% and 5% to 6% and 3% of net sales of Cod Liver Oil with Viosterol and Viosterol respectively. Winthrop's royalties have remained unchanged at 10% and 5% throughout the period included in this report. It is expected that Winthrop's royalties will be reduced effective as of January 1, 1940, to 6% on Drisdol and Viosterol and 3% on Cod Liver Oil with Viosterol. This reduction is not reflected in the foregoing figures.

REPORT OF THE TRUSTEES OF THE WISCONSIN ALUMNI RESEARCH FOUNDATION TO THE BOARD OF REGENTS OF THE UNIVERSITY OF WISCONSIN, JUNE 22, 1931

As the Wisconsin Alumni Research Foundation has for its avowed object, aid in supporting scientific research in the University of Wisconsin, it is fitting that a report of its activities be made to the governing board of the institution. This is all the more desirable since there have been so many changes recently in the personnel of the Regents that the aims, purposes and accomplishments of the Foundation are probably not well understood by all of the present governing board.

HISTORICAL DATA

The plan under which the Foundation was organized was presented to the April meeting of the Board of Regents in 1925, and upon approval by the Board, a corporation known as the Wisconsin Alumni Research Foundation was incorporated November 14 of that year. To quote from the charter of organization, its purpose is:

"To promote, encourage and aid scientific investigations and research at the University and to assist in providing the means and machinery by which the scientific discoveries and inventions of the staff may be developed and patented and the public and commercial uses thereof determined; and by which such utilization may be made of such discoveries and inventions and patent rights as may tend to stimulate and promote and provide funds for further scientific investigation and research within said University."

The origin of the corporation grew out of the discoveries of Professor Harry Steenbock on the development of antirachitic properties (vitamin D) in pharmaceutical and food products when subjected to irradiation by ultraviolet light. It was at once obvious that a discovery of this character could be so misused as to defeat, in large measure, the beneficial values of the invention, without the protection of a patent. This was especially true in relation to the dairy industry which is of such special significance to the welfare of this state. Therefore, Dr. Steenbock felt that it was highly desirable for him to protect the use of the process by taking out a patent.

Realizing its commercial possibilities, and desirous of seeing the avails of its development utilized in the furtherance of scientific investigation, Dr. Steenbock very generously offered to turn over his patent entirely to the University if some practicable method of handling the same in an effective manner could be worked out.

Digitized by Google

INSTITUTIONAL TREATMENT OF PATENT PROBLEMS

Universities, through their very organization, are poorly equipped to handle problems of this kind. Steenbock's previous experience with his own University had illustrated this fact, for when his work on vitamin A had been offered to the University authorities for them to secure a patent on what was almost as important as vitamin D, the cumbersome machinery of University administration failed to function rapidly enough so as to protect this discovery. Different institutions have tried a variety of schemes to meet this recognized need.

In some institutions the patents have been assigned to the Regents, but governing bodies of this sort are scarcely ever organized to handle effectively matters requiring so much detailed attention. Other institutions have tried the organization of a Research Committee of the staff to undertake commercialization. Sometimes a combined membership of both staff and regents has been tried. In a few cases, institutions have frankly joined hands with some specific commercial concern, giving it full authority to push the commercial development while the financial returns were divided in some manner. Obviously, with the amount of business detail involved, it would seem preferable to have a direct connection with commercial organizations, for it must always be recognized that there is a big gap (and often a most expensive one), between the pencil sketch stage of the first idea regarding a discovery, and the perfected commercialization of the completed process.

If the Steenbock patent had been the only one to handle, doubtless, it might have been possible to have disposed of this independently to such business groups as would have represented the pharmaceutical and food interests. With the possibility, however, that there were other latent opportunities in discoveries to be made by other staff members who might desire to have the University become a beneficiary in a similar way, the idea was worked out that a non-profit-sharing corporation could be organized that would take the several patentable ideas and commercialize their development through a system of licenses. If this can be sucessfully done, it will have the double advantage of securing not only patent protection with such avails as may flow from commercial development, but the monies so received will be dedicated to the public service through the fact that the income is to be used for the support of research which is in general for the benefit of the public.

The Wisconsin Research Foundation, therefore, is an unique experiment in social development in that the results of research in a publicly supported institution are used for the public benefit through corporate channels. As the Foundation is blazing a new trail in this social and economic field, its course is being watched with considerable interest by sister educational institutions. Conferences and correspondence has already been had with a number of other universities who see in this Wisconsin idea, a new mode of approach to a problem which has baffled successful utilization. Already some of our sister universities have adopted the Research Foundation idea in toto.

ORGANIZATION OF FOUNDATION

A group of interested alumni subscribed the necessary funds to start the corporation. The management of the corporation is vested in six trustees, all of whom are alumni. The personnel of the Trustees is as follows:

Geo. I. Haight, Chicago.
W. S. Kies, New York.
Judge Evan A. Evans, Chicago.
L. M. Hanks, Madison.
T. E. Brittingham, Jr., Madison.
Timothy Brown, Madison.

Mr. Haight has been President of the Trustees since organization; Mr. Brittingham, Vice-President; and Mr. Hanks, Secretary and Treasurer. An Executive Committee consisting of the officers of the Association is empowered to transact interim business. On July 1, 1930, H. L. Russell was elected Director of the Foundation in which capacity he assumed the executive management of the work of the Foundation.

The Trustees of the Foundation meet bi-monthly in Chicago, while the Executive Committee also has bimonthly meetings in Madison, alternating with the sessions of the full Board. No compensation has been paid any of the Trustees for attendance on meetings.

FINANCIAL POLICY OF TRUSTEES

Most educational foundations when they are launched start with an endowment, often running into millions of dollars, and a fairly well defined objective for which funds have been furnished. After they organize an administrative staff, they are in position to inaugurate their policies of support from the beginning.

The Wisconsin Alumni Research Foundation had no such start. All it had, at the outset, was the willingness of an individual to turn over to a body of individuals interested in the scientific welfare of the University an idea that was subject to patent in order to protect it from misuse. After the organization of the Foundation, it was necessary to put this only asset which the corporation had to work. Initial contracts were made on the best terms that could be secured under the circumstances. Business concerns recognized that Dr. Steenbock's discovery would require the investment of indefinite sums to make possible the commercial utilization of the process. Royalties which might have been possible if a completed commercial project had been sold had to be gauged in the light of existing conditions. The Foundation had no money to invest in experimental development. The Regents of the University were not in position to allocate necessary funds from public taxation to purposes of this character.

Under these conditions, naturally, the only policy which the Foundation could follow was to secure what available contracts that were possible. Ordinarily, it might be expected that starting from notheig some years would elapse before the Foundation would be in a financial position to do much of anything in the way of financial aid to University research. The Trustees early adopted the two following policies:

1. To build an endowment principal of substantial amount, the annual income of which might be used to advance research in the University.
2. To accumulate a reserve that is necessary to protect the inventions at stake.

Competition now-a-days is so keen in the business world, and the constant advance of science is so rapidly rendering existing methods obsolete, that it would be the height of folly for the Foundation not to accumulate such reserves to protect its basic operations. Litigation of any successful enterprise is bound to ensue sooner or later. Commercial concerns are disinclined to join hands with any organization whose main asset is an altruistic attitude toward the public welfare, but which does not have the financial resources to pay its share in maintaining its legal rights.

A definite objective of the Trustees is, therefore, to accumulate a substantial sum; invest this in sound securities. The income from such a fund can be used even now for the furtherance of University research. This has been done already during the two years for which the Foundation has been receiving royalties. The financial success of the Foundation has already been far beyond the hopes of its organizers. The Steenbock patent is yielding very substantial sums on the basis of its royalties. The value of the discovery is being steadily recognized as more and more scientific work is done on it by other than our own scientists. While rival methods have been proposed and even patents granted thereon, the commercial applicability of the Steenbock process has far outdistanced those that in any sense can be regarded as at all competitive methods.

Numerous infringers have been warned, suits instituted, and in most cases adjustments made in which licenses under the Steenbock patent have been taken to avoid further legal complications.

If the Foundation had no other duty to undertake than the adequate development of the Steenbock process, it would have its hands full. Very soon, its organization must be expanded to work its other patents.

The accumulation from royalties so far have been almost wholly from the ultraviolet patents. During the calendar year 1930, the gross income was $354,590, or very nearly $1,000 a day throughout the year. This income has been developed within less than three years. It is hardly probable that the phenomonal growth of the past will be continued throughout the life of the patent, but, frankly, we do not have sufficient data on which to hazard an opinion.

The Foundation Trustees are very firm in their attitude that the Steenbock process shall be very carefully controlled, and it is not at all likely that there will be any large number of additional licenses granted under the patent.

Digitized by Google

INVESTMENT POLICY OF THE FOUNDATION

From the outset, the income of the Foundation has been invested in high grade bonds. With the comparatively rapid growth of this amount for investment, it is obvious that great care should be given to the formulation of a safe investment policy. The Treasurer has corresponded with a large number of the Universities that have invested funds and also educational foundations to ascertain existing policies of those institutions. Data secured from nineteen institutions reveal the fact that there is apparently no settled policy that is generally recognized. Apparently, most institutions have simply developed their own plan without much reference to the formulation of any specific rules. Perhaps this may be the end result after their years of experience, but it would seem proper to work out some general criteria that could be followed with safety. One policy is evident from the reports of these nineteen institutions: By far the majority of those reporting follow the plan of making investments of considerable proportion in stocks (including both common and preferred) as well as bonds.

The Wisconsin Foundation has not adopted as yet any final code of procedure to follow. It would like to acquire somewhat more experience before taking final action on so important a matter. But for the immediate present, it has adopted the following principles to guide it in its investment procedure:

1. Diversity as to geographic distribution and type of security.
2. Specific limit of amount invested in any bond or stock $10,000 of par value except that investments made in investment trusts limited to one class of stock only might exceed such limit.
3. Wisconsin investments should be carefully considered and favored, other factors being equal.
4. No investments to be made in any securities of any companies in which any trust is personally interested.
5. No investments to be made where financial rating (if rated) is below Moody Baa.
6. Investments in stocks (including investment trust)) shall not exceed 10% of Foundation's holdings.
7. A duly constituted committee of the Board shall have the responsibility of making the investments, such selections, however, to be brought to the knowledge of entire Board at next regular meeting.
8. It shall be the policy of the Foundation to submit its investment portfolio to competent financial counsel for advice at least every six months.

BOND INVESTMENT ACCOUNT

On June first of this year, the invested capital of the Foundation was $406,594. All of the funds as acquired (after operating expenses and allotments for research have been deducted) have so far been invested in high-grade bonds. 34% of these are rated by Moody as Aaa; 23% Aa; 32% as A; 3% as Baa. Of the remaining 10% that have no Moody rating 3.7% are local issues and slightly over 6% are bonds if investment corporations. Over 60% of entire bond list mature within 10 to 20 years.

Computed on the basis of income the entire bond portfolio averages on basis of cost 4.87%, a very astisfactory rate when the fact is taken into consideration that over one-third of entire list are triple A ratings.

A very significant fact is the present market value of the investments compared with the cost when purchased. The market price of the entire list on June first was only $4,828 less than the original cost ($406,594) a testimonial to the degree of care that has been taken in securing an unusually stable list, during these times when the bond portfolios of our soundest financial institutions have, in the great majority of instances, suffered severely.

CARE WITH WHICH CONTRACTS HAVE BEEN MADE

The Regents of the University may be interested in the nature and type of contracts which the Foundation Trustees have executed to date. When Dr. Steenbock first announced his discovery it was obvious that the commercial use of the process might be applied to two classes of products:

1. Medicinal preparations, and
2. Foods.

Digitized by Google

It was a matter of much inportance at the outset to determine the potency of the product and see that under commercial use the method was employed in a manner that would be entirely beneficial. In this pioneer field, the Foundation did a large amount of work, aiding the American Medical Association to fix proper standards of potency, methods of test control, etc. In order to prevent any monopolistic situation from developing licenses were granted on identical terms to five leading pharmaceutical houses of the United States and three in Canada (one of which is a quasi-governmental institute for the manufacture of biological products). Highly potent irradiated ergosterol dissolved in corn oil was finally selected. By ultraviolet irradiation, this was given a potency 100 times the vitamin D equivalent of standard cod liver oil. Under the approval of the American Medical Association, the name *Viosterol* was adopted and although certain manufacturers had put out a product under thier own particular brand, the Association insisted on a unification of name, standards of potency, etc. A "fortified" cod liver oil preparation was also authorized. From the very beginning these two products were immediately accepted by the medical profession. Numerous medical reports have now been issued which show the value of these preparations in the treatment and prevention of rickets and other bone deficiencies. Price levels were set by the Foundation so that a reasonable profit for handling could not be exceeded.

FOUNDATION CUTS PRICE OF VIOSTEROL

With a more extended experience coming from wider clinical use, efforts were made to improve the preparations that were first put out. Within six months the potency of Viosterol was increased two and one-half times and on June 1 of this year, a reduced price schedule was made effective so that a much more potent product can now be sold at a price from 20 to 25% lower than a year ago. This naturally reduces the income of the Foundation as the royalty rate is based on the wholesale pharmaceutical selling price, but in the effort to place this product within the reach of the maximum number, this has been regarded by the Trustees as a sound policy to follow in the public interest.

RELATION OF "IRRADIATED" FOODS TO DRUGS

From a purely commercial point of view, the argument might be raised that activation of foods would prejudicially affect the income from the drug field. The Foundation has, however, the basic information after careful tests and clinical observations to show that a wider use of vitamin D will be of material value to health. For that reason, it has felt the obligation to fortify certain types of foods, especially those intimately connected with the nutrition of the young, regardless of the financial implications involved.

In doing so, it has kept constantly in mind the great desirability of maintaining the license system on a dignified and proper basis so as to prevent exploitation of the public. Even the advertising of the respective licensees is subject to control where any mention is made of the Foundation or any of its assignors.

FOOD CONTRACTS

Very few foods contain any appreciable amount of vitamin D. Only egg yolk and to a slight extent butter fat possess any appreciable quantity. Cereal foods are notably deficient, although these products can be "activated." It was this striking discovery of Dr. Steenbock's that made possible a great improvement of foods as to this quality; but much care must be exercised in the use of an agent of this type, although there is no danger whatever in overdosing food supplies. Clinical experience now indicates beyond doubt that even the medicinal dose which is several hundred times more potent than is permitted in a food can be increased over a 1,000 fold before any ill effect can be detected.

Although the Foundation has been solicited by hundreds of applicants, to grant licenses for all kinds of preparations, such as cosmetics, chewing gum, candies, soft drinks, and the like, the Trustees have refused to consider licenses except in the case of a limited number of food products. The income of the Foundation could have easily been increased several hundred thousand dollars per annum had it been willing to give licenses to concerns whose main interest was to find an advertising feature that had novelty and new pulling power. Also, it must be kept clearly in mind where irradiation is practiced, that the treated product must be merchandized in a way to prevent adulteration, mixing, or interchange from

Digitized by Google

point of treatment until the product reaches the consumer. Cartoned, or sealed containers are, therefore, most suitable to use; with bulk goods, no positive assurance can be given the consumer that he is actually protected in what he buys.

So far, vitamin D has been incorporated only in bread, certain health crackers, breakfast foods, and powdered milk. Special effort could well be made to fortify those foods that are of most nutritive value for children, recognizing the importance of getting the "sunshine vitamin" into the system of the city child under winter conditions where reliance on nature's method often leaves a glaring deficiency. The oil and fat field is also susceptible of proper development especially with reference to activation of salad oils.

Some fear has been expressed that too wide a latitude would be followed by the Trustees in developing this food field. The exceedingly conservative attitude which has been taken is the best proof that it is not the intention of the Trustees to violate a sound public policy in this regard.

Indeed one of the soundest reasons for the development of the Foundation as a suitable means of handling the Steenbock process lies in the rigid control through which it is possible to protect the public and prevent unscrupulous commercialism from capitalizing the Steenbock discovery. Had not some such method been devised under which this patent could be properly utilized, the discovery itself would have undoubtedly resulted in irreparable injury to the agricultural development of the state and subjected the University to severe criticism.

The Foundation has an agreement with the Paediatric Research Foundation of Toronto, an organization allied to that university, that is modeled after the Wisconsin plan. No licenses are granted in Canada without the approval of this technical group that is composed of the leading pediatric and medical men of the Dominion.

BREAD CONTRACTS PROHIBIT ANY PRICE ADVANCE

In this connection, it is of interest to note when licenses were granted for bread, a clause was incorporated in all contracts, prohibiting the licensee from charging any more for "irradiated" bread than under similar sale conditions for the untreated product. With this proviso, it is obvious that the licensee must pay an exceedingly small royalty for the use of the process. As a matter of fact, the Wisconsin Foundation's share in these royalties is measured in thousandths of a cent per loaf. From the point of view of building bone and teeth in the growing child, it is much more important to the Foundation to put vitamin D into a hundred million loaves of bread a year, at an infinitesimally small royalty rate than it would be to put it into a special brand that had to be sold at a higher price, and therefore, available mainly to those who belong to the well-to-do class where the cost of the product is not the deciding factor in the diet.

Up to date, the cereal and bread field have been quite completely covered. The Foundation is now ready after long experimental study, to enter the dairy field. The results obtained by world-recognized pediatricians in the milk field, where trials have been made with infants and children show indisputably the very high nutritive value that can be secured from the use of these irradiated products.

SCOPE OF FOUNDATION PATENTS

While the first, and by far the most important patent which has been assigned to the Foundation has been that of Dr. Steenbock, the corporation has also been the recipient of a considerable number of other assignments of patents, either outright, or of applications now pending before the Patent Office. The Foundation has felt it highly desirable to encourage staff members in making such assignments, even though the matter of financial return was none too alluring. In taking over such applications the Foundation assumes the obligation of paying all costs in securing the patents and maintaining the yearly taxes which nearly all countries, except the United States, levy on a patent to maintain it in good standing. Owing to the highly technical nature of patent law and the widely varying mode of procedure which exists in different countries, the problem of securing adequate legal protection in the more important countries of the world involves a large amount of highly technical work for which the individual staff member is not at all qualified to undertake.

Up to date, the Foundation has expended in the neighborhood of $15,700 in securing the eleven patents (or applications) now on its books. In addition, to this amount, legal expenses in foreign countries amounting to several thousand dollars have also been met. In most cases where foreign counsel has been required, arrangements have been made that the necessary expenditures for such

Digitized by Google

service be deducted from foreign royalties, as earned, so as not to incur a direct charge against the Foundation receipts.

It is of interest to note that the income taxes that the Foundation has already paid in Great Britain exceed $15,000 before the residual income could be remitted to the United States.

ASSIGNMENTS OF PATENTS BY MEMBERS OF THE UNIVERSITY

Soon after the organization of the Foundation, it became necessary for its Trustees to consider what should be done as a standard policy regarding the acceptance of assignments by members of the University staff who might voluntarily desire to have the Foundation aid them in promoting their problems of patent development. It is only now and then that a method or process is likely to be discovered or invented which is worth considering from a patent point of view. The great bulk of the scientific work of the University always will and should be of such a nature that the question of patentability is not even likely to arise. In the interests of social service, especially as applied to a state-supported institution, the Foundation will discriminate most closely as to what discoveries should be commercialized in this way. When this problem was carefully considered, it was found upon inquiry, that there was a strong feeling that it would be better to offer the discoverer some financial recognition, after the expenses of securing the patent had been defrayed. This follows the same general principle that is often followed in private organizations.

Consequently, Memorandum Agreements were worked out in which the division of "net avails," after all expenses had been repaid, was made on the basis that the patentee receive 15 percent while 85 percent went to the Foundation.

In Dr. Steenbock's case, he was not willing that the rule should be applied. From the outset, it was his thought that the entire net royalties would go for the support of research. It was only after it was pointed out to him that the Foundation could not wisely operate on the basis of two different methods of control that he finally consented to abide by the judgment of the Foundation Trustees.

No royalty payments were made to him during the first year's operations, but during the last two years the regular 15 percent royalty payments have been made to him after the operating expenses of the Foundation's activities have been met from monies obtained wholly from the Steenbock royalties.

COMMERCIALIZATION OF OTHER PATENTS

Up to date, the energies of the Foundation have been directed toward a reasonable occupancy of the commercial field of the Steenbock patent. Nevertheless, efforts are also being made toward the commercial use of some of the other patents as rapidly as opportunity permits.

The Hisaw method for the production of certain hormones has been contracted with a leading pharmaceutical house, as has also the Hart method of using copper with iron in the treatment of certain nutritional anemias, but it will be a year or more before any avails will be forthcoming. With several other patents, the preliminary experimental work has been carried out. What is now needed as to push the economic utilization of these methods.

Another difficulty which confronts the Foundation is that the range in scope of the patents controlled, runs through such a wide field that it will be quite beyond the limits of any single organization to engage in developmental work in so many different branches of human knowledge.

By and large it will probably cost somewhere from 15–25% of the receipts of even successful patents to cover the necessary expenses connected with their completion and development. Assuming an average net income of 80%, and that 15% of the net avails goes to the inventor (12% of total received), the Foundation is then in position to add 85% of 80% net (or nearly 68% of the total) to its investment principal. It is from this invested principal that the support of research should first be considered.

Much is going to depend on the magnitude and number of unforeseen factors that are almost sure to be injected into the problem. The largest and most uncertain item is what may be required for litigation and infringements. This, no one can estimate beyond the present. Already we have several suits on our hands. Some of these we are bringing and in some cases we are being sued. From the standpoint of permanence, it is desirable to have some of these questions adjudicated in the near future so that the Foundation may know definitely what it has to work with. In any event, it is obligatory upon the Trustees that the Foundation

Digitized by Google

is well intrenched financially so as to be able to fight its legal battles, if necessary. The policy of the Trustees has been to divide the cost of any possible litigation with its licensees, the Foundation assuming one-half, and all the licensees collectively an equal amount. Strong commercial concerns have, however, indicated an unwillingness to enter into contractual relations with an organization unless they are assured of sufficient financial backing that possible litigation could be aggressively met.

PATENTS AND APPLICATIONS NOW ASSIGNED TO FOUNDATION

Appended below is a list of the various patents and applications that are now the property of the Foundation:

Name	Description	Patents (or applications) in—
Harry Steenbock	Antirachitic activation of medicinal and food products by ultraviolet irradiation.	United States, Canada, Great Britain, France, Belgium, Germany, Argentine, Italy, Norway, Sweden, Denmark.
E. B. Fred, W. H. Peterson	Improvements in Process of Producing Lactic and Acetic Acids.	Germany, United States, Canada, Norway, Sweden, Brazil, Argentine, Great Britain.
W. Busse	Liquid Air for Freezing of Hard Shell Seeds.	United States.
E. B. Hart	Use of Copper and Iron Salts in Anemia.	United States.
P. A. Tetrault	Acetic Acid and Glucose Fermentations of cellulose.	United States.
J. A. E. Eyster	Apparatus for Measuring Venous Pressure.	United States.
E. O. Wiig	Leavening Agent	United States, Great Britain, Germany, Sweden, Norway, Argentine.
F. Daniels	Mechanic's Cleanser	United States.
F. L. Usaw	Pituitary Hormones	United States.
L. C. Hurd	Marine Paint	United States.

ALLOCATION OF FUNDS FOR RESEARCH

The Foundation Trustees have, during the past year, worked out a system of considering and acting on requests for grants-in-aid to research. Obviously, it would be unwise for the Trustees to consider such a program on a piecemeal basis, as financial commitments should take into consideration the available funds as well as all requests that are made. Therefore, action was taken setting a definite time for the consideration of requests.

In view of the fact that the University Research Committee makes its recommendations regarding the distribution of special research funds, which it has at its disposal, in the spring of the year for distribution in the following fiscal year, the Foundation Trustees decided to adopt a similar mode of procedure.

The advantage of this system is that the Foundation's resources should be integrated with the University's problem so there will be no duplication. The Foundation, therefore, has adopted the policy that all of its aid to research will be made through the regular University machinery for such purposes, and not directly from the Foundation to any individual or department.

After the requests for grants-in-aid have been approved by the Foundation Trustees, the lists of projects and accompanying grants are submitted through the Dean of the Graduate School and the President of the University, to the Board of Regents of the University for their consideration. If approved and accepted by them as meeting the University policy with reference to gifts, the Foundation Treasurer then transfers to the Secretary of the University the requisite monies, the Secretary setting up the necessary credits on his books for the respective projects. All requisitions and expenditures are then made by the staff member in charge in the same manner as with all other University expenditures. In this way, the University officials retain full and complete control of the nature of the project studied, appointment of all staff members working on the same, all expenditures made, and a complete disposition of results as to mode of publication or otherwise.

By close dovetailing of these relations and a sympathetic attitude toward the promotion of research from the broadest possible point of view, the Foundation feels that its resources are being most wisely used to supplement funds available to the University from other sources.

Digitized by Google

DIGEST OF AID ALREADY GIVEN UNIVERSITY

As the earliest contracts which the Foundation executed did not take effect until about the middle of 1929 and as income from the same did not, in some instances, become available until even later that year, the aid for research could not be begun until well into the fiscal year of 1928–1929.

Recognizing the desirability of having some definite policies to follow, the Foundation Trustees have adopted three general principles to guide them in the allocation of funds:

1. To stimulate as wide an interest as possible in the entire graduate body of the University, it was decided to maintain a:

(a) *Lectureship in Science* that would bring to the student body of the University annually an outstanding man in some special field of science, who would give a week of his time to lectures and discussions. $1,000 a year has been earmarked for such purpose to cover this project. The first year Dr. Walter B. Cannon (Physiology) of the Harvard Medical School was invited; last winter Dr. Ross Gortner (Biochemistry) of the University of Minnesota. For 1931–1932 the University Committee is happy to announce that Professor Milliken of California, the outstanding physicist of the United States, has been secured. The selection of the incumbent to this special lectureship is made by a faculty committee of which Dean Slichter of the Graduate School is chairman. From the reaction of the graduate student body, no move has been made recently at Wisconsin that has been more stimulative and inspiring to this body. It was felt in this way that the entire University student body would be aided by the first fruits of the Foundation's efforts.

2. Selection of definite lines of scientific endeavor toward which the Foundation could give special aid.

The University will, naturally, be unable to furnish sufficient funds for the prosecution of all desirable lines which its staff is equipped to push. The test that can probably be expected is to select those lines that are likely to yield the most for the expenditure of the taxpayer's money. But a University that is to go forward in step with the best of modern science must constantly be attacking many problems in a fundamental way. This means going into new and untried fields, with no assurance that the results which may be found will immediately prove to be of great value to the state.

The Foundation derives its support primarily from a discovery that was undertaken without any thought that it would prove commercially profitable. It feels that monies invested in this spirit cannt be wholly lost, and it also feels that it can thus be of major value to the enlargement of the University's program for the support of such fundamental research.

As a consequence, after consultation with the Research Committee, the Dean of the Graduate School and with staff members, it was decided by the Trustees that the greatest service which they could render the University would be through the selection of a limited number of fields that were already engaging the attention of University scientists to some extent at least; that a substantial amount of aid be rendered in these special fields, especially if problems of a fundamental character could be attacked. On the basis the Foundation would then supplement the existing University resources in a way that would broaden as well as deepen the University science research.

(*a*) *Mold Research.*—In accordance with this plan a year ago, the Foundation Trustees placed at the disposal of the Regents, the sum of $10,000 a year (on a five year program) for the purpose of studying fundamentally the physiology of the fungi, more particularly the molds. From this fund the physical facilities have been provided, laboratories being remodeled in the basement of Agricultural Hall for bacteriological work under Dr. Fred's direction and a biochemical laboratory in the basement of the Agricultural Chemistry Building under Dr Peterson's direction. The work here undertaken is to study from a pure science point of view, mass cultures of different molds to ascertain their physiological properties and effects. Guided by these two investigators, a specially selected staff has been making definite and valuable progress in this field.

(*b*) *Hormone Field.*—To those who are scanning the scientific horizon for the most interesting and fruitful opportunities to expand the field of definite scientific knowledge, no field offers more promise than that which is embraced in the relatively new subject of the hormones, those peculiar secretions of the ductless glands in the human and animal body, the function of which for centuries has largely baffled scientific thought.

Digitized by Google

The concepts of modern physiology and medicine are likely to be as profoundly affected by these studies in endocrinology as has been witnessed in the field of human and animal nutrition through the discovery of the vitamins. A number of the physiological laboratories of several Universities have been the recipients of material aid from some of the educational foundations. Dr. Evans of California, has been able to advance his studies very rapidly through a $50,000 grant which was made to that institution by the Rockefeller Board.

Wisconsin has on its staff one of the leaders in the hormone field in the entire country. Dr. Frederick L. Hisaw of the Department of Zoology. The Foundation has been aiding Dr. Hisaw for the past two years, allotting in 1929–1930, $1,500, and last year $3,050 to make it possible for him to secure additional chemical help. This coming year it is proposed not only to continue this chemical aid to Hisaw, to the extent of $3,500, but the Foundation has agreed to support two additional projects that are closely correlated with his investigations, viz, $850 to Dr. Sevringhaus for research on the clinical use of the Hisaw Hormone, and $900 to Dr. Tatum of the Pharmacological Department for clinical work in controlling toxic goiter.

(*c*) *Vitamin Field.*— Naturally, the Foundation is especially interested in the continuance of research in the most aggressive manner in the field of the vitamins. For the past fifteen years, Wisconsin has been in the foreground in this phase of biochemistry. The researches of McCollum, Hart, Steenbock and their colleagues have made the Wisconsin campus one of the outstanding, not only in the United States, but for that matter, in the entire world. Graduate students from many of the advanced countries have sought the inspiration of these laboratories. It has, therefore, been possible to push investigations in this field very steadily, as often a small amount of aid has enabled a relatively large amount of work to be accomplished. The University has always recognized the desirability of granting some aid from its own research funds in this vitamin field to Dr. Steenbock and Professor Hart. The Foundation Trustees also made available in 1928–1929, $2,500 for Steenbock to be used under Dean Slichter's administration. As this was not all used in that fiscal year, the balance was carried over to the fiscal year 1929–1930. For this coming year (1931–1932) the Foundation has allotted $1,550 to enable a fundamental study to be made on the physiological effects on the different parts of the ultra-violet spectrum. A correlation of a physical and a biological study of the radiant energy from this invisible part of the spectrum will contribute, it is hoped, to a definite solution of some most important problems.

3. It would not be wise for the Foundation to allot all of its available resources to two or three lines of work of long-time duration. The Trustees have also been willing and anxious to consider all requests made covering the several fields and for short time purposes. For these requests several thousand dollars have been thus employed.

(*a*) *University Computer.*—For the past two years, the position of University Computer has been supported by a grant of $750 a year. This assistant is selected by a special faculty committee of which Professor Mark Ingraham of the Mathematics Department is Chairman. Requests made by any department of the University requiring intricate mathematical computations are considered by this group before the time of the computor is placed at the disposal of the applicant. In this way, six or seven departments of the University have been able to facilitate their statistical studies. Professor Ingraham is strongly of the opinion that this work should be put on a permanent basis. The Foundation Trustees feel that this is a phase of service work rather than a specific research problem which would seem more appropriate for support from their resources. Nevertheless, at the urgent solicitation of the Ingraham Committee, the Trustees continued the grant for another year again making $750 available for the purpose.

(*b*) *Aid in Physics and Chemistry.*—During the past year (1929–1930), the Foundation paid the salary of Professor Roebuck ($3,000 for the second semester), and also $450 for the employ of summer assistance to enable him to put his entire time on certain physical research of a wholly fundamental character.

$1,200 was also made available to furnish assistance to Professor Freudenberg, the Carl Schurz Exchange Professor in Chemistry. His acceptance of this exchange relation was contingent upon the University furnishing necessary laboratory assistance.

Digitized by Google

AMOUNT ALLOTTED FOR RESEARCH IN 1931–1932

The Foundation Trustees have just allocated the sum of $21,500 for grants-in-aid to research for the coming fiscal year. From the various requests made, support has been extended to the Departments of Pharmacology. Clinical Medicine and Physiology in the Medical School; Zoology and Physics in the College of Letters and Science; and Bacteriology and Agricultural Chemistry in the College of Agriculture.

Two general projects, the University Computer and the Foundation Lectureship, are not limited to any single group, but serve the University as a whole. This will make a series of nine different projects to which aid will be extended for the next year.

If the Regents accept this program, the monies will be transmitted, as in the past, to the University Secretary for deposit to the credit of these respective projects and all expenditures for operation and staff appointments made through the customary university administrative machinery.

FOUNDATION CONTROL LABORATORY

The rapidly expanding activities of the Foundation in taking on contracts for the utilization of vitamin D necessitates no inconsiderable amount of routine testing of activated products so that the public can be positively assured that they are getting intrinsic vitamin values what potency has been determined as necessary and desirable.

It is, of course, highly desirable that this control work be quite divorced from the research work of the University; otherwise the load of routine would seriously sap the research vitality of those concerned with the same.

Two courses of procedure were presented to the Regents last fall, viz.:

1. Arrange with the Regents for the provision of space in existing buildings in which this work could be done on the basis that other arms of the State ask the University to house certain laboratory operations rather than duplicate new buildings for the purpose. If this arrangement was not practicable then,
2. The Foundation Trustees would construct a laboratory wholly outside the University and equip and operate the same.

The Regents recognized that an expenditure of Foundation funds for capital expenditures would be unwise: that such a course of procedure would make it impossible for the Foundation to be of any material aid in University research for some time. Hence, they approved the first plan, the Foundation Trustees assuming, however, all expenses required to make the physical changes in the Agricultural Chemistry Building where this control laboratory is located. The Foundation has spent to date about $3,500 for constructional changes, and is carrying a pay roll and maintenance cost for the operation of this control laboratory which is about $7,500 a year.

The Regents also placed at the disposal of the Foundation Trustees, a room in Bascom Hall for an executive office, which the Foundation has furnished and equipped. The Foundation pays rent, however, to the Regents for the use of all space occupied by it. The convenience of having the official quarters of the Foundation at the University rather than downtown is apparent, as the daily contact of the Foundation officers is mainly with the administrative and scientific staff of the University rather than with the town public. Incidentally, it may be mentioned that it is necessary also to maintain a Chicago Office as the legal work of the Foundation is handled through several Chicago firms and much of the business of the Foundation is more conveniently handled out of Chicago than Madison.

When the work of the Foundation was started two or three years ago, no one then realized how rapidly it would expand. In this short time, its business ramifications are already world wide, a gross royalty income measured in several hundreds of thousands of dollars per annum has been built up, and the field of only one patent has yet been touched. Legal complications are already on the horizon; contract interpretations require adjudication. Scientific work must be pushed in sundry fields. New patent applications are coming to the Foundation that will require much attention in the very near future. In short, the idea that was launched with considerable trepidation a few years ago has already reached proportions far beyond expectations.

Digitized by Google

With no previous experience to guide, it would be rash indeed to forecast the future. It will be the policy of the Trustees to move cautiously but progressively forward. In any event, an exceedingly interesting educational project has been launched at the University. Its uniqueness may well intrigue the interest and attention of those who are searching for what the future may hold toward the advancement of educational ideals.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Chicago, Ill., September 19, 1942.

E. I. du PONT DE NEMOURS CO.,
GELATIN PRODUCTS CO.,
GENERAL FOODS CORPORATION.
STANDARD BRANDS, INC.
VITAMINS, INC.

GENTLEMEN: We take pleasure in announcing that the Foundation has entered into modified license agreements with its five pharmaceutical licensees under which those licensees have given up their exclusive rights in the pharmaceutical field. Effective immediately, therefore, the foundation is in a position to grant additional licenses for the use of Steenbock vitamin D in pharmaceutical products for human consumption.

We have prepared and are enclosing supplies of printed license agreements. As you will note, there are two forms of license agreement. One is for companies which should, in the opinion of the foundation, be permitted to use the foundation seal upon one or more of their products. The other form of license agreement does not permit the use of the foundation seal. For your help preliminarily, we have prepared and are enclosing a list of companies which we believe are qualified to use the foundation seal licenses. This list does not purport to be complete and we shall be very happy to consider promptly, as possible seal licensees names of any other concerns which may be submitted by you.

In view of the foregoing you are now free to sell Steenbock vitamin D for pharmaceutical use to licensees of the Foundation, including those now licensed and those which hereafter may execute either of the enclosed forms of license agreement. As a matter of procedure, we suggest that when you obtain signatures to either of these forms of license agreements by your customers, you arrange to have triplicate originals executed by the customers and send all three originals to us for execution by the Foundation. We will then return two originals to you, or one executed original to you and one to your customer. We also suggest that prior to obtaining executed agreements from your customers you be sure to fill in or have filled in the blank spaces in sections VI and VIII of the seal form of license (providing, respectively, for product formulas and products upon which the seal may be used) and in section VI of the nonseal form (providing for product formulas). This will facilitate completion of agreements by the Foundation, since the Foundation will wish to have these clauses filled in before executing any license agreements.

We also call your attention to section V, the royalty provision, in each of the enclosed forms. We believe that the simplest way to handle the royalty matter is for the supplier to pay the royalty of 10 cents per million units on vitamin D sold to user licensees rather than to have the user licensee pay this royalty directly to the Foundation. However, the latter method of procedure may be followed if you wish.

We are hopeful that you will be able to obtain substantial new business in this field and are looking forward to a marked expansion of the use of Steenbock vitamin D as a result of opening the pharmaceutical field upon a nonexclusive basis.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
By ——— ———, *General Counsel.*

JULY 31, 1931.

We were much interested in memorandum of July 13, and hope that uniformity may be obtained and continued in the distribution of Viosterol.

We hardly feel it necessary or desirable for us to send out a letter to our wholesale trade, because we have not found any price-cutting tendencies. Our field

Digitized by Google

force, together with district and branch managers are continually in touch with our wholesalers and if any variation from price schedule occurs on our label, we believe that we would be informed without delay.

Yours very truly,

JUNE 2, 1933.

WISCONSIN ALUMNI FOUNDATION,
Madison, Wisc.
(Attention Dr. H. L. Russell.)

DEAR DR. RUSSELL: I have before me bids on Viosterol 5 cc. packages and 50 cc. packages and Viosterol with cod-liver oil 3 ounces and 16 ounces made by a number of firms to the United States Veterans' Bureau Proposal No. 871, opened May 28, 1933, at 11 a. m.

Among the firms bidding is Bundt, Inc., of Detroit. This is the second bid they have made at a lower price than any of the licensees of the Wisconsin Alumni Foundation. Their first bid was accepted at much lower prices than those agreed upon with the foundation.

This was brought to our attention by Mr. Keim, who stated that Bundt, Inc., were putting up their own product and that one of their packages was in the possession of Squibb & Co. You may have heard from Mr. Keim about this.

My purpose in calling this to your attention is to inquire if this is not in violation of our agreement, and if it is not possible to bring some pressure to bear on Bundt, Inc., in order to eliminate this unfair price cutting. You may wish to investigate and let us know if anything can be done.

Very truly yours,

S. DEWITT CLOUGH, *President.*

[Handwritten.]

Mr. Clough—I phoned Mr. Melville—F. W. Ken Co., and he seemed to be somewhat alarmed by my calling, said he would write me details.—RMC.

WISCONSIN ALUMNI RESEARCH FOUNDATION,
Madison, Wis., April 18, 1939.

Mr. RICHARD L. FRUCHTERMAN,
Standard Brands, Inc., New York, N. Y.

DEAR MR. FRUCHTERMAN: Confirming conversation which Messrs. Ross and Barney had with you in New York on March 3, it is agreeable to the Foundation that your Company employ irradiated yeast as a source of vitamin D in your present product "Fleischmann's Vitamin Tablets" containing 150 U. S. P. vitamin D units per tablet—such products to be manufactured and sold by Standard Brands Inc., or its subsidiaries anywhere in the world except the United States, Germany, and Great Britain (including Ireland and the Isle of Man).

The royalty basis for this product will be 15 cents per million U. S. P. vitamin D units used, the same royalty as we are shortly making effective in the United States for products of our pharmaceutical licensees not now containing irradiated Vitamin D.

If at any time the Foundation reduces its royalty basis below 15 cents per million U. S. P. Vitamin D units to any of its pharmaceutical licensees, it will automatically make a similar reduction in your royalty basis.

We do not believe it necessary to prepare a supplemental contract covering this subject, and if the foregoing is agreeable to you as outlining the understanding with respect to this product, kindly indicate your acceptance at the foot of this letter on the second copy enclosed and return to this office.

In the event that you are interested in marketing this product in Great Brtiain we suggest that you contact Col. E. A. Rose of Glazo Laboratories, Ltd. London, and discuss with him the matter of terms for a possible sublicense under the Steenbock British Patent.

Very truly yours,

WISCONSIN ALUMNI RESEARCH FOUNDATION,
H. L. RUSSELL, *Director.*

EXHIBIT A

MEMORANDUM OF AGREEMENT, Made this 10th day of November, 1928, between WISCONSIN ALUMNI RESEARCH FOUNDATION, a Wisconsin corporation not for pecuniary profit, hereinafter called the "Foundation," HARRY STEENBOCK, of Madison, Wisconsin, hereinafter called "Dr. Steenbock," I. G. FARBEN INDUSTRIE AKTIENGESELLSCHAFT, a German Corporation, hereinafter called "I. G." and THE WINTHROP CHEMICAL COMPANY, INC., a corporation of the State of New York, hereinafter called "Winthrop."

Dr. Steenbock is Patentee and the Foundation is Assignor in the United States, Great Britain, and in certain other countries, of inventions dealing with anti-rachitic Products and Processes and has applied for patents thereon in certain other countries, and as the I. G. has contemporaneously been engaged in research along similar lines and there are pending applications for patents in a number of countries, including the United States and Germany, on the inventions of Dr. Windaus for products and processes for activating or irradiating ergosterol and its derivatives as an anti-rachitic, in which inventions and patents in the United States, Winthrop has the equitable ownership.

Recognizing the desirability of making immediately available the results of the scientific investigations which have been carried on by them and of avoiding controversy which might hamper the progress of the research in which all parties are engaged and thus obstruct the use of discoveries of benefit to humanity.

The parties agree:

(1) To cooperate with each other and act together to secure the prompt patenting of pending applications, and not to oppose or obstruct the issuance of patents thereon.

(2) Save for rights heretofore granted to The Quaker Oats Company, Dr. Steenbock and the Foundation grant to I. G. the exclusive right and exclusive license to Germany under all patents which may be there issued to Dr. Steenbock or acquired by the Foundation, for all uses and for all products, without royalty. The field of said The Quaker Oats Company shall be excluded from this contract for the life of said patents, which field covers the right to give anti-rachitic qualities to the following products; rolled oats and oat meal, puffed rice, puffed wheat and other puffed products, corn meal and corn flour, pancake flour and macaroni, stock and poultry feeds and other cereal products except wheat and rye flours and except cereal oils and save for breakfast foods except crackers, biscuits, cookies, breads and other similar products of wheat and rye flours.

(3) In consideration of which I. G. and Winthrop agrees not to sue any present or future licensee of Dr. Steenbock or the Foundation in any country (except Germany) for infringement of any patent on activated or irradiated ergosterol and its derivatives which may issue on the applications for patent of Dr. Windaus or his assignee, now pending.

(4) Dr. Steenbock and the Foundation grant to I. G. a nonexclusive license to manufacture and sell activated or irradiated ergosterol and its derivatives in all countries except the United States and Great Britain (including North Ireland and the Isle of Man) where licenses have already been given to others. In Great Britain, Dr. Steenbock and the Foundation undertake, if I. G. so requests, to use their best endeavors to secure a nonexclusive license to I. G. on the same terms and conditions as given the most favored licensee.

(5) In consideration of the grants herein made to I. G., it agrees to pay to the Foundation for the promotion of research during the life of this contract, the sum of Twenty-Five Hundred Dollars ($2,500.00) annually, the first payment to be made forthwith. For the same purpose, it also agrees to pay to the Foundation annually for three (3) years the sum of Five Thousand Dollars ($5,000) (the first payment to be made one year from the date hereof), and agrees to pay annually thereafter the sum of Ten Thousand Dollars ($10,000). The said $5,000 and $10,000 payments are to be credited each year against royalties. I. G. agrees to pay to the Foundation a royalty of Three percent (3%) on the net sales price of medicinal and pharmaceutical preparations made or sold by or through it, or its agents, containing activated or irradiated ergosterol or its derivatives in whatsoever quantities anywhere in the world save in Germany, the United States, and Great Britain and regardless of the existence or nonexistence of patent rights possessed by Steenbock or the Foundation where made or sold.

(6) Except for the United States and Great Britain (including North Ireland and the Isle of Man), I. G. is granted the right to make and sell and the right to

Digitized by Google

sublicense proper sublicensees as hereinafter defined, to make and sell irradiated food products (whether directly irradiated or indirectly activated by the use of irradiated ergosterol or its derivatives). For irradiated food products made by it or its agents, I. G. shall pay to Foundation a royalty of One percent (1%) of the net sales of the food products thus made and sold. If I. G. shall grant sublicenses such sublicensees irradiating food products directly or indirectly shall be required to pay to I. G. a minimum royalty of One percent (1%) of net sales. As to such royalties from sublicensees, I. G. shall pay the Foundation Seventy-five percent (75%) and shall retain for its services in securing said sublicensees, supervising their conduct, making collections and otherwise handling the business with them the other Twenty-five percent (25%) of said royalties.

(7) The term "net sales" used herein means the listed selling price minus discounts to the trade and makes allowance for returned goods.

(8) Payments of royalties required hereunder shall be made within ninety (90) days following each calendar quarter beginning January 1, 1929.

(9) Proper sublicensees referred to in clause (6) hereof shall mean firms financially responsible, which conduct their business upon sound, ethical, and scientific lines and deal in worthy products.

(10) Any advertising material referring to the Steenbock process, the Steenbock patents or the University of Wisconsin or the Foundation shall be submitted to the Foundation for its approval. This requirement shall be made by I. G. of sublicensees and the I. G. shall see to it that all advertising is free from misstatements.

(11) The I. G. shall properly comply and require all sublicensees to comply with all statutory or legal requirements pertaining to the marking of patented articles.

(12) Inasmuch as all royalties paid hereunder are based upon net sales of pharmaceutical or medicinal preparations employing activated ergosterol or its derivatives or upon net sales of food products, the I. G. shall furnish the Foundation on dates when royalty payments are due, a statement of the business done in each field which may be properly checked, if ever required, by the Foundation, by neutral certified accountants.

(13) If any payments herein covenanted to be made shall be in arrears and unpaid for a period of ninety (90) days after becoming due or if the I. G. shall commit other breaches and not remedy the same within ninety (90) days after written notice to it by the Foundation, the Foundation may, by notice in writing, determine the license but without prejudice to its rights to recover royalties then due.

(14) The term of this license shall be the life of the German Steenbock Patent when granted.

(15) This license may be determined by the licensee at any time after three (3) years from the date thereof by notice in writing addressed to the Licensor three (3) months before the expiration date named in said notice.

IN WITNESS WHEREOF, the parties hereto have executed this agreement on the date first above written.

EXHIBIT No. 143

PROPOSED SUBSTITUTE G. E.-A. T. & T. LICENSE AGREEMENT

JUNE 30, 1932.

MEMORANDUM FOR MR. C. P. COOPER, VICE PRESIDENT

I have your memorandum of yesterday transmitting copies of the latest (June 28, 1932) draft of the proposed substitute G. E.-A. T. & T. license agreement, and asking for prompt suggestions and comments on this draft.

While I have looked through the proposed substitute agreement, I have not had time to analyze the various provisions in detail. This will obviously take some time. I note, however, that the present draft still contains the fundamental objection which I had to the earlier drafts. Consideration and appraisement of these fundamental points rather than a detailed analysis of the specific rights given and acquired are, I think, the controlling factors.

The two fundamental objections which I have to the proposed agreement are:

1. Its long term (22½ years) with a further diminishing influence for an additional 17 years (minimum).
2. The fact that we obligate ourselves for 22½ years *in advance* to turn over non-exclusive rights under substantially *all* of our patents and inventions to General Electric et al.

The fact that in return we are assured of certain non-exclusive rights from this group during the corresponding periods seems to me entirely inadqeuate compensation for the price we will have to pay. Consideration of these two factors convinces me that as a business proposition the proposed agreement is highly objectionable and is not one which we would for a minute consider entering into unless there were further compelling reasons and/or very substantial values entirley outside of the agreement itself.

I have not attempted to develop the magnitude and worth of values outside of those conferred by the proposed agreement itself nor to appraise the force of those factors which have led us thus far into the consideration of a long-term all-inclusive cross-licensing agreement as a substitute for the 1926 agreement, on which we have already served notice of cancellation. Unless the present jeopardy, as a result of failure to execute some such agreement as is here proposed, is absolutely compelling, it seems to me that we should use every effort to find another way out of our present difficulties, even possibly to the extent of taking the risks involved in the outcome of the anti-trust suit.

In considering the proposed agreement we are not much interested in comparing its provisions with those of the 1926 agreement. If the alternative for the 1926 agreement over a certain period of years was the proposed agreement over the same number of years, I think there would be little question but that the second agreement was decidedly preferable. What we are interested in is a comparison of the situation which would develop under the proposed agreement contrasted with the situation which will work out of the 1926 agreement under the terms of the cancellation, that is, a situation where a couple of years hence we will begin to regain full possession of the fruits of our own creative work.

As a straightforward business proposition for the future I am strongly of the opinion that our present situation, namely, that in which we will gradually work out from under the 1928 agreement, is better than any blanket agreement for a long period of years which we could draw up. If, however, the exigencies of the case are such that final judgment demands the execution of a blanket interchange of licenses, I most certainly would insist either on a very much shorter normal term for the agreement than the 22½ years now proposed, or would insist on incorporating in the document a definitely stated method of cancelling the arrangement after a few years, if experience or changed conditions or laws indicated to either party advisability of terminating the arrangement.

While my main objections to the suggested agreement are those just mentioned and discussed later on, a cursory reading of the last draft seems to indicate some things which should either be eliminated or modified. For example, paragraph 2 of Article V, which relates to the use of tungsten by us provides, in addition to certain licenses and the manner in which we shall purchase tungsten.

Digitized by Google

"The Telephone Company agrees that, on all sales of telephone and telegraph signal lamps or telephone and telegraph ballast lamps to other than Companies of the Bell System---------- it will pay to the General Company a royalty of ,2 percent on the net sales price thereof."

While I have not checked this accurately against the wording in the original agreement, I think that the proposed provision is unaltered. When the original agreement on which we have now served notice of abrogation was written, there was some justification for this provision. The situation as regards tungsten patents has, however, changed materially in the time which has elapsed, and if my understanding is correct there are now no controlling patents which would justify us in binding ourselves in the future to any such royalty payment.

Coming now to the two points which seem to me fundamental and controlling objections to the proposed arrangement, I will discuss them in the order noted above.

TERM OF THE PROPOSED AGREEMENT

If executed in its present draft form, the license agreement would normally run for at least 22½ years, with rights continuing for at least 17 years thereafter. Even 22½ years carries the term of the agreement beyond the point of service of any of us who are now in responsible charge of the business. It presupposes a certainty about the future which assuredly cannot exist either as regards the interests of the Bell System, the necessity for meeting unforeseen attacks upon it, the character of the anti-trust laws, or the state of general public opinion. Whatever the terms, any such long term agreement which places in the hands of others, and in advance of their creation, valuable rights which may be sorely needed to safeguard and advance the interests of the Bell System, is a highly dangerous affair.

Our experience with the 1920 and 1926 agreements should, I think, make us very chary about long term blanket arrangements of this kind. That experience certainly shows how far we can be in error in our attempts to forecast the future.

The normal duration of the 1920 agreement has 10 years, with possible cancellation on 3 years' notice thereafter, or a minimum expectancy of life at the time of signing of 13 years. Within 2 or 3 years after its signing conditions had become so bad that the parties to the agreement resorted to arbitration, the results of which were the abandonment of the original agreement and the execution of the July 1, 1926 agreement.

This latter agreement provided for a normal term of only 7 years, that is, about one-half that of the 1920 agreement, and provided further that notice of cancellation could be served on or after July 1, 1930, that is, after a period of four years of trial. While we did not serve notice of cancelation until 1931, the onerous character of the agreement was apparent before July 1, 1930.

It is now proposed that we enter into an agreement whose normal life is more than three times that of the agreement on which we have served notice of abrogation, and almost twice that of the original 1920 agreement.

If one desires to get a vivid picture of what this interval of time may involve, we have only to look backward a corresponding period of years in the history of our own business. On January 1, 1910, we had no vacuum tube amplifiers, no carrier current, no voice frequency telegraph, no permalloy, no picture transmission, no radio telephony, no loud speakers, no high quality instruments and none of the refined tools for advancing the communication art which have been developed in the last ten or fifteen years.

The vacuum tube did not appear on the scene in any usable form until about the beginning of 1913. Substantially the whole industrial application of electronic physics has been accomplished in the last fourteen or fifteen years. The big advances in many other branches of modern physics have taken place in a lesser time. In the few years between 1913 and 1920, acting under the stimulus of a free and untrammeled field for development, a very large part of the basic work which has made possible our modern telephone plant and service, was done. The momentum of this work carried on for some time after the signing of the 1920 agreement. It took some time for us to realize the effects of the deadening influence of the 1920 and 1926 agreements on our creative activity.

Although no one can, of course, predict the future with any high degree of assurance, it seems almost certain that progress of industrial research and the industrial applications of science throughout the world in the next ten or fifteen years will be as great as or greater than that which has thus far occurred in double the length of time. The base of fundamental scientific knowledge is infinitely wider than it was ten or fifteen years ago, and the number of trained men engaged

Digitized by Google

in applying this fundamental knowledge is many times greater. In the field of electronic physics alone the pace of development is tremendous. There is hardly a field of industrial application which is not concerned with some phase of this branch of modern physics. There is consequently no foretelling where revolutionary and controlling discoveries may be made. Since under the patent laws these discoveries are not common property, any industry likely to be affected and which is concerned about its future welfare must be prepared to do its part in the development race, and to maintain maximum flexibility of movement under its patent rights, or face the necessity of possible heavy monetary tribute or even the question of its ability to live and prosper.

Of course it might be argued, in connection with the duration of the proposed agreement, that it will not in all probability live its normal minimum life. Personally I think it most certainly will not. There are too many unknown factors involved in the problems of the developing business of the contracting parties, in changing laws and in changing public opinion. I do not see, however, that this is any justification for our embarking on a course, escape from which may later entail an equally onerous though different entanglement.

CHARACTER OF THE PROPOSED AGREEMENT AND ITS FAR-REACHING EFFECT ON THE FUTURE OF THE BELL SYSTEM

The proposed agreement is not a free interchange of nonexclusive licenses between the contracting parties. It is an interchange of nonexclusive licenses with limitations of use. In many cases the grants are unilateral and in others, and as 4C of Article VI, the limitation of field is such as to make the apparent grants to us actually of little or no value.

Broadly speaking, the practical effect of the agreement is to limit the field of possible development of each party to its present major activities. Where unilateral grants only are made it is clearly impossible for the granting party to contemplate successful competition when confronted with an adversary who has both his own and the other person's patents. Even where bilateral licenses are made, there is probably little danger of competition by the grantee in fields where the grantor has already attained to a commanding position.

Thus, while a casual reading of the agreement by one not thoroughly conversant with all the factors may appear to establish the basis for an enlarged free development in most of the fields, this is not actually the case.

Now, what are the respective fields in which the two parties appear by the agreement to be granted enlarged ability to grow and develop? Whether by definition or the limitations on the grants, the Telephone Company's field is substantially that of its present business, while the General Electric's field is everything else, including a substantial field of communication.

If we could see clearly that at no time in the next 22½ years would it become advantageous for us to be in any way active in any field outside of what we are now doing, and if the proposed agreement was one with *all* the other creating agencies in the world, the proposed agreement *might* be advantageous even though it had the inevitable result of very greatly narrowing our own creative effort. We would then at least be assured of entire freedom to use in our current business all of the discoveries and inventions which pertain to it. * * *

But the proposed agreement is not one with *all* the creative agencies in the world. It is an agreement with a single group who, though large, represent but a fraction of the potential scientific creative ability of the world. Since no one can foretell where controlling discoveries of a patent character will arise, either among men or as byproduct results of work undertaken in far removed fields, I think it would be rash to assume that during the next 22½ years we could place reliance on even a major number of controlling patentable inventions originating in the General Electric et al group.

What the suggested agreement proposes to do is to leave us merely with nonexclusive patent rights to our own work for a period of 22½ years. Since in addition the field of our activity is practically narrowly circumscribed in character, as compared with that of the General Electric group, even though the individual units of our business are large, we will have little or no incentive to expend time, money, or creative thought on anything which at its inception is not clearly in the field of our current business.

Experience has already proven conclusively that research undertaken in one field may turn out to have a byproduct value in another field which is even greater than the direct value within the field in which the research was undertaken. Many of our own large values in the telephone business are directly the result of

Digitized by Google

research work undertaken for an entirely different purpose and without realization of its direct application to the telephone business. In such cases the work would never have been started if our sole criterion was its prospective value in our going business.

The far-reaching effect of the proposed agreement on the character and scope of our research and development work is apparent. Viewed both from the standpoint of the research worker in our laboratories and from the standpoint of those responsible for the expenditures incurred by the laboratories, the inevitable result would be a narrowing of the field of activity and failure to undertake anything which at the outset is not clearly directed to the field of our current business. From the standpoint of the man who has a brilliant idea which in its first nebulous form seems to be applicable outside our business, there will be little or no urge to go ahead in the face of a situation where he knows that the results of his work have been sold in advance outside of the Bell System. From the standpoint of management there will likewise be no incentive, but quite the reverse, to urging him on and appropriating money for his investigations.

Under the 1926 agreement we have already begun to see the working of this process and the greatest stimulating effect imaginable on the creative group followed the knowledge that by serving notice of cancellation the first steps in removing the hampering restrictions of that agreement were being taken.

I am certain that if the proposed agreement were actually put in effect for 22½ years the character and scope of our research and development activity would follow the course I have indicated. It might always be a large affair within narrow limits but in the main its results would be of small value except in the slow evolution of a going business which was dependent on the outside world for those outstanding ideas which alone mark great progress. Both relatively and actually our research and development organization would diminish in stature and that of General Electric et al. would increase because of the very much wider scope and degree of freedom of field which the agreement assigns to them.

It is not alone, however, in its reaction on our creative organization that the proposed agreement sets up a situation inimical to our interests and which may at any time be fraught with great danger. Even if there were no effect of curtailment on our research and development activities, a situation which left us for a long period of time with nothing but nonexclusive rights under our own patents would deprive us of a very powerful tool for safeguarding our interests, whatever they might be, against the command of inventions arising outside the General Electric et al. group. Nonexclusive rights under patents, even though assignable, may be of very little or no value when it comes to negotiating for the acquisition of rights under patents which are of great moment to an industry.

While it is obvious that the basic inventions which control a large new field are not made very often, one can never tell where or when they will crop up. The tremendous growth in both fundamental and industrial research in recent years has unquestionably increased the probability of such inventions, with their covering patents, arising. When such patents do turn up, possession of a strong and unmortgaged patent position on the part of an industry needing rights is frequently the most powerful and sometimes the only available weapon for securing those rights. Ability to stop the owner of a fundamental and controlling patent from realizing the full fruits of his patent by the ownership of necessary secondary patents may easily put one in position to trade where money alone might be of little value.

We have already had vivid illustration of this in connection with the 1920 agreement, where ownership of what we thought to be fundamental and controlling patents in the hands of a group which were not willing to sell for money would have seriously threatened our business had it not been for our own free patent position. Had we at that time possessed only nonexclusive rights with substantially equal rights in the hands of others, there is little doubt but that we would have had to pay an enormous sum for the right to use in the Bell System the General Electric patents which they and we at the time thought might hold the key to our development.

A similar situation inimical to our interests may easily arise in the future if the proposed agreement is executed.

CONCLUSION

For the several reasons discussed above I am firmly of the opinion that a long-term agreement of the character now being discussed is not in our best interests and should not be entered into, unless the best alternative open to us is still so dreadful as to make this agreement, which will be binding on the next generation, clearly the only way out.

Digitized by Google

If it can be done and if the movement set on foot by our notice of cancellation of the 1926 agreement can be carried through, and we ultimately be restored to the full command of the fruits of our own work, I would have no fear whatever of treating any patent situation which might develop on its individual and specific merits. It is conceivable of course that a situation might arise in which our own patent position would be of little value in the acquisition of rights. Such a situation is not, however, bettered by the execution of the proposed agreement.

In a word, it seems to me we should in matters of this kind do everything possible to maintain the fundamentals of a situation which will develop the maximum creative incentive on our part and assure us the maximum value, in whatever way we choose to use that value, of the patent results of our work. To face the future with one arm palsied and the other arm deprived of a large part of its muscular force seems to me a highly dangerous situation for any industry.

F. B. JEWETT.

EXHIBIT No. 144

[Handwritten:] Mr. Webb sent copies for other Directors.

Copy to: Mr. Alfred P. Sloan, Jr., General Motors Corp., New York City.
Mr. Donaldson Brown, General Motors Corp., New York City.

DECEMBER 15, 1934.

Mr. E. W. WEBB,
President, Ethyl Gasoline Corporation, 135 E. 42nd Street, New York City.

DEAR MR. WEBB: I learned through our Organic Chemicals Division today that the Ethyl Gasoline Corporation has in mind forming a German company with the I. G. to manufacture Ethyl lead in that country.

I have just had two weeks in Washington, no inconsiderable part of which was devoted to criticising the interchanging with foreign companies of chemical knowledge which might have a military value. Such giving of information by an industrial company might have the gravest repercussions on it. The Ethyl Gasoline Corporation would be no exception, in fact, would probably be singled out for special attack because of the ownership of its stock.

It would seem, on the face of it, that the quantity of Ethyl lead used for commercial purposes in Germany would be too small to go after. It has been claimed that Germany is secretly arming. Ethyl lead would doubtless be a valuable aid to military aeroplanes.

I am writing you this to say that in my opinion under no conditions should you or the Board of Directors of the Ethyl Gasoline Corporation disclose any secrets or "know how" in connection with the manufacture of tetraethyl lead to Germany.

I am informed that you will be advised through the Dyestuffs Division of the necessity of disclosing the information which you have received from Germany to appropriate War Department officials.

Yours very truly,

EXHIBIT No. 145

JANUARY 12, 1935.

CHIEF OF ARMY AIR CORPS,
Washington, D. C.

DEAR SIR: Complying with the suggestion made at my interview with General Westover and Major Howard on the 5th instant, I beg to submit herewith a statement of facts relative to the erection and operation of a plant for the production of Ethyl fluid in Germany.

Obviously from the facts presented we are faced with the necessity of building a plant in Germany or licensing somebody there to do so, and much more speedily than we originally anticipated because of the recent action taken by the Italian Government in according to an Italian company the right to engage in the manufacture of antidetonants, including Ethyl fluid, in Italy (please see pp. 2–3, Statement of Facts).

Digitized by Google

Ethyl fluid has been manufactured for about 12 years on an ever-increasing commercial scale, and it could be successfully produced by any experienced chemical organization here or abroad from the disclosures in the patents themselves and the literature on the subject.

There is no technical data of military importance known to us which would be involved in the building of such a plant that has not already received wide publicity, or is of common knowledge in the aviation field. Certainly nothing would be lost or suffered by our Government in our going ahead, but conversely it is reasonable to expect that certain definite advantages will accrue to it by our doing so.

We would be pleased to provide against future eventualities by agreeing that we shall not prematurely pass along to the proposed German company—or under any other contract we may make for the foreign manufacture of tetraethyl lead—any technical data of military importance, and will insert a protective clause covering this point in such contract. The following is the clause we have in mind:

"Anything in this agreement to the contrary notwithstanding, neither party shall be obligated to disclose to the joint company any new technical information relating to the manufacture, composition, or use of antiknock compounds, which information is of military value, without the approval of the appropriate government authority of that party."

Your approval of the form of this clause or any suggested changes or modifications of it would be appreciated.

If we have failed to present adequate facts for your information in respect to this matter, kindly advice us and we will be pleased to furnish any additional data you may request if within our power to do so.

Very truly yours,

E. W. WEBB, *President.*

STATEMENT OF FACTS

We control certain basic patents for the manufacture of tetraethyl lead and Ethyl fluid in the United States and a number of foreign countries. To date the manufacture of these products under license under our patents has been carried on in the United States only. Since 1924 these products have been manufactured solely by the E. I. du Pont de Nemours & Company and ourselves, excepting for a relatively small amount. The expiration dates of the patents vary in the different countries. For instance:

Argentina	July 12, 1934 (Expired)
France	March 19, 1939
Italy	March 20, 1939
England	April 13, 1939
Australia	April 13, 1939
Japan	May 5, 1940
Norway	March 17, 1941
Sweden	March 19, 1941
Germany	March 25, 1942

We are advised that the E. I. du Pont de Nemours & Company has several so-called "improvement" patents for the manufacture of tetraethyl lead (but not Ethyl fluid) in Germany, which expire subsequent to ours.

The patents for the manufacture of these products owned or controlled by ourselves and the du Pont Company have not been worked in Germany and under the German law that Government—if it appears conducive to the public interest—has the right to grant a license to anybody to manufacture them in Germany if the patentee fails to do so and refuses to grant a license on reasonable terms for manufacture in Germany.

About two months ago we received a proposal from the I. G. Farbenindustrie A. G. (hereafter referred to as I. G.) in Germany to purchase on a cash or license basis our entire rights in that country. At the time this proposal was made we were advised the German Government for reasons of economic self-sufficiency is directly and indirectly subsidizing and supporting the production of 1,100,000 tons per annum of gasoline from coal in Germany. This production will be in large part owned by, and in its entirety supervised by, I. G., the inventor of the oil-from-coal process. The production would normally average about 57 to 60 octane number. The market requirement there is for a gasoline of 64 to 74 octane. In order to convert 1,100,000 tons of gasoline from coal to the higher octane numbers it must be subjected to an additional manufacturing process, thereby materially increasing the cost and reducing the yield by converting part

Digitized by Google

of the gasoline into gas. This same improvement in octane number can be accomplished by the addition of a relatively small amount of lead, at a low cost and at no sacrifice of yield of the more expensive gasoline from coal.

The German consumption of gasoline is about two and a half per cent of the total consumption of the world, and if all the internal combustion motors in Germany were to use a motor fuel containing Ethyl fluid same could be supplied, in our opinion, by a plant located in Germany consisting of not more than five or six autoclaves of the size now being used in this country. Our supplying plants have sixty-four autoclaves, and with such knowledge as the I. G. undoubtedly have they could construct and operate a plant to take care of all of their requirements in not exceeding six months, and in an emergency in very appreciably less time.

We are advised and believe that the primary purpose behind the proposal is the use of Ethyl fluid in the government-subsidized motor fuel produced from coal, above referred to. If the object of the Germans was to place themselves in position to have Ethyl fluid available for use in aviation in the event of war, they could easily follow the course of increasing their present regular purchases from us (which amount to about forty tons per annum) and stocking up enough Ethyl fluid to last well beyond the period required to build a plant to meet such requirements in the event of such contingency.

Therefore, when the proposal came to us from I. G. to sell or license our entire Ethyl position in Germany we reviewed the facts above presented and could not escape the conclusion that we must either manufacture in Germany or grant a license on reasonable terms for someone to do so—failing which, the German Government would grant a license or licenses to sombebody to manufacture there. Having reached this conclusion, we countered the proposal of the I. G. by stating that we would be agreeable to the formation of a company in Germany which would build and operate an Ethyl fluid plant and the capital requirements of which would be supplied by I. G. and ourselves in equal amount. The I. G. accepted this proposal in principle.

Ethyl fluid has been manufactured in our behalf and that of our predecessor the General Motors Chemical Company, and used in automobiles in the United States since February 1, 1923, and in a number of foreign countries for several years. It has been used as an antiknock agent in some aircraft engines during the past eleven years, and for the past five years to a substantial extent. Last year we made shipments of Ethyl fluid for aviation use to twenty-four foreign countries and it was the peak year in its consumption for aviation here and abroad. Although its enlarged use in aircraft has been a source of great satisfaction to us, nevertheless the total consumption for that purpose amounted to only two percent of its total consumption for automotive use. There can be, we think, no question but that our main interest in the steps necessary to protect our patents abroad lies in the automotive rather than in the aviation field.

Since the appearance of Ethyl fluid as an antiknock compound it has received a large amount of publicity, some of it in the general press but more particularly in automotive, aircraft, and scientific journals here and abroad. Although the manufacture of Ethyl fluid entails considerable skill and is fraught with certain health hazards unless properly controlled, nevertheless there is no question in our mind but that any experienced chemical organization, here or abroad, could successfully manufacture from the disclosures that have already been made through the patent offices and in the literature, even if we did not directly transmit to such company any of the knowledge gained by the du Pont Company and ourselves through the years of manufacture. Doubtless for a period of time without the benefit of the experience of the du Pont Company and ourselves it would cost some other company more to manufacture it than with such knowledge. The ingredients that go into Ethyl fluid have been published a number of times over a period of years and it is also susceptible to analysis to the point of minute accuracy.

Although our Italian manufacturing patents do not expire until March 20, 1939, we were advised by our London office on Wednesday morning of this week that they had been informed only the day before of a decree that had been issued by the Italian Government dated December 28, 1934, which reads as follows:

"In view of the report presented by the Industrial Federation it is thought to accord to the Societa Nazionale Chimica, with headquarters in Milan, a new plant for the manufacture of anti-detonants for combustion motors (bromide of ethylene and tetraethyl lead). This industry was formerly subject to manufacture in foreign countries to the disadvantage of the Nation. The mixtures have furthermore not been put into actual practice. The Societa Nazionale Chimica will principally use ingredients of a national nature. The production will be absorbed principally by the Ministry of Aviation and in a large measure by motorists."

Digitized by Google

This decree has been issued regardless of the fact that we have not been requested by the Italian Government to manufacture in Italy or to issue a license to any concern to manufacture there. The information came to our organization this week with no previous intimation that such action was in contemplation. Undoubtedly this action was taken because of the fiscal situation as to imports, and this situation has become so acute in certain other countries as to disrupt the free flow of exchange and interfere with imports This is especially true in Germany and the net effect there will indoubtedly be the granting of licenses by the German Government providing for the internal manufacture of Ethyl fluid unless we promptly proceed with the conclusion of the contract with I. G.

After reviewing the situation with as much thought and care as we have been able to give to the subject, we feel sure that it will be to the interest of our Government as well as ourselves to have our company participate in the construction and operation of a plant in Germany or any other foreign country, rather than to have such plants built and operated exclusively by the nationals of any foreign country.

There is, furthermore, an equally, if not more, important business aspect to the German situation. We are owned by the Standard Oil Company (New Jersey) and General Motors Corporation in equal shares. General Motors has important investments in Germany, producing there in excess of fifty percent of the motor cars. Standard Oil Company (New Jersey) has large investments in all phases of the petroleum business in Germany and sells more than thirty percent of the motor fuel in that country (including fifty percent of the gasoline produced from coal in Germany by I. G.). We feel that in the interest of international trade and the effort to build up goodwill as well as for the reasons specifically mentioned here, that it would be extremely unfortunate for all concerned if we do not proceed to carry out the agreement with I. G. for the joint manufacture of tetraethyl lead and Ethyl fluid in Germany under our patents and those of the du Pont Company. A refusal or undue delay on our part in going ahead with the building of the plant would not only place Germany in a position where it could lawfully proceed without our participation, but might bring on some serious reprisal measures.

Respectfully submitted,

ETHYL GASOLINE CORPORATION,
By E. W. WEBB, *President.*

NEW YORK, N. Y., *January 12, 1935.*

MR. J. K. JENNEY,
Asst. Director, Foreign Relations Department.

TETRAETHYL LEAD—ENGLAND. RE YOUR LETTER JULY 8TH

In accordance with my telephone conversation with Mr. Swint this morning, I think we should tell I. C. I. that the technical and engineering information which we are giving I. G. in connection with Tetraethyl Lead is being given them entirely at the request of the Ethyl Gasoline Corporation. As they no doubt know, Ethyl Gas and I. G. set up some arrangements whereby they are going to participate jointly in the manufacture and sale of Ethyl Lead in Germany and we are turning over our information to Ethyl Gas which they in turn can submit to I. G. as part of the bargain in connection with this joint enterprise. Under these circumstances there are no "terms * * * agreed upon by du Pont with respect to the I. G. Farbenindustrie for Germany."

Presumably if Ethyl Gas should make some arrangements with I. C. I. in connection with the manufacture of Tetraethyl Lead in England, they would at the same time arrange to have us furnish I. C. I. with the necessary manufacturing and technical information in connection with that manufacture.

E. G. ROBINSON,
General Manager.

EXHIBIT No. 147

HEADS OF AGREEMENT RELATING TO THE MANUFACTURE AND SALE OF ETHYL FLUID IN GERMANY

(1) Ammoniakwerk Merseburg G. m. b. H. (a subsidiary of I. G. Farbenindustrie Aktiengesellschaft) hereafter called "Leuna" and Ethyl Gasoline Corporation hereafter called "Ethyl Gasoline" a Delaware corporation (owned jointly by General Motors and Standard Oil Co. (N. J.)), shall cause to be organized a German corporation known as Ethyl G. m. b. H. (or A. G.) hereafter called "Ethyl". This company shall both manufacture and market Ethyl Fluid. In principle it is agreed that the parties will take the stock of Ethyl equally but it is understood that actually Ethyl Gasoline's share will be taken in equal parts by D. A. P. G. and Opel and paid for by these companies. Neither party shall thereafter dispose of any of its stock except to the other, or except to a member of its own corporate family, or except as provided in paragraph 4. The corporate family of Ethyl Gasoline shall include all subsidiaries of General Motors and of Standard Oil Co. (N. J.) as well as direct subsidiaries of Ethyl Gasoline. The corporate family of Leuna shall include all subsidiaries of I. G. In all cases "subsidiary" means more than 50% of the stock (or other language to the same effect).

(2) (*a*) Ethyl will obtain from Ethyl Gasoline an exclusive license for Germany under all the present and future patents controlled by Ethyl Gasoline relating to the manufacture and use of the Ethyl and Q-brands of anti-knock compounds for motor fuels and the present patents of Dupont for improvements in the manufacture of tetra-ethyl-lead.

Ethyl Gasoline will also give to Ethyl its present and future technical information and experience relating to the same products and the technical information and experience to date of Dupont in the manufacture of tetra-ethyl-lead.

(*b*) Leuna will grant to Ethyl an exclusive license under its present and future German patents relating to the same products and its present and future technical experience and information relating to the same products.

(*c*) Leuna will also give Ethyl Gasoline through Ethyl the exclusive right outside of Germany to all of Leuna's (I. G.'s) patents and technical experience and information relating to the same products provided that Ethyl Gasoline may not grant licenses to nor give technical information and experience to anyone who does not transmit to Ethyl through Ethyl Gasoline an exclusive right for Germany in the same field.

The term of the obligation covered by this par. (*c*) shall be contemporaneous with the term of the like agreements between Standard Oil Co. (N. J.) and General Motors and Ethyl Gasoline.

(*d*) With the exception of the rights obtained under paragraph (*c*) of this Section 2, Ethyl will grant to Ethyl Gasoline the exclusive royalty free rights for the world outside of Germany in respect of its future patents, technical information and experience relating to the products covered by this agreement. No time limit shall be placed on this obligation.

(*e*) Neither party shall be obligated to disclose to Ethyl nor shall Ethyl be obligated to disclose to Ethyl Gasoline any new technical information relating to the manufacture, composition or use of anti-knock compounds until such time as proper military authorities have passed upon the military value of such data and given approval for such release to foreign nations, and even if such approval is obtained there shall be no obligation for any party to make a disclosure to any of the others in respect to any anti-knock compound other than Ethyl Fluid. This clause in appropriate form shall be carried through into any agreement which is made by an I. G. subsidiary for carrying on operations for the account of Ethyl.

(*f*) Ethyl shall pay to Ethyl Gasoline after having obtained permission from the German Government as a royalty for all licenses and experience $25,000.—p. a. in U. S. currency. Such payments shall commence with the first sale of Ethyl Fluid made by Ethyl and shall continue until the close of the year in which the Ethyl Fluid patent expires. (Patent expires Dec. 11, 1941).

(*g*) It is understood that under the foregoing arrangement no licenses are to be exchanged by the parties in respect of the manufacture of raw materials used in the manufacture of tetra-ethyl-lead or for the manufacture of other components of Ethyl Fluid.

Digitized by Google

(*h*) It is understood, that the obligation of Ethyl Gasoline in respect of the granting of licenses above referred to shall become effective only as required by actual progress of the parties under the agreement.

(3) Ethyl shall contract with Leuna to erect and operate for the account of Ethyl on land owned or leased by Ethyl, at a location satisfactory to Leuna, a plant for the manufacture of tetra-ethyl-lead and for the compounding of same to produce Ethyl Fluid. The capacity of the plant shall be initially about 800 to 1,000 kilos tetra-ethyl-lead per 8 hour day. All funds for the erection and for operation of such plant shall be supplied by Ethyl. Leuna to be reimbursed for all of its expenses, direct and indirect, incurred in the erection and operation of the plant. It is recognized that in an arrangement of the sort proposed in this Section 3 no difficulties will arise with regard to direct expenses; the question of indirect expenses, however, is always difficult of solution; it is therefore suggested that to cover all indirect expenses Leuna shall receive a fee fixed as . . . . . Pfg. per kilo of tetra-ethyl-lead.

Leuna shall have the preference in the supply of such raw materials as are manufactured by I. G. or covered by manufacturing arrangements to which it is a party for use in the manufacture of tetra-ethyl-lead, and the policy of Ethyl shall also be to purchase other materials used in Ethyl Fluid from Leuna, if I. G. is engaged in the manufacture thereof, but in neither case shall this be construed to prevent Ethyl from taking all steps necessary to insure that it is obtaining supplies at the lowest fair price, and where—as in the case of Ethylene dibromide—this requires that Ethyl purchase from other producers to keep such producers in operation, Ethyl will do so.

(4) It is the desire and intention of Ethyl Gasoline to offer a ½ interest in Ethyl to the users of Ethyl Fluid in Germany.

To facilitate this Leuna agrees that on request of Ethyl Gasoline Leuna will authorize Ethyl Gasoline to sell to the nominee or nominees of Ethyl Gasoline for the account of Leuna at not less than cost ½ of its shares in Ethyl provided that—

(a) DAPG and Opel shall each sell simultaneously at the same price ½ of the shares owned by them to the same nominee or nominees,

(*b*) each such nominee shall be engaged in the actual manufacture or sale of gasoline containing Ethyl Fluid in Germany,

(*c*) the remaining share holdings of Leuna and DAPG and Opel shall be pooled for all voting purposes.

Without committing itself further than above, Ethyl Gasoline declares that its plan is to organize a holding company to acquire the ½ interest in Ethyl to be sold to the users of Ethyl Fluid. Shares in this holding company will be offered to all major companies engaged in the manufacture or sale of gasoline containing Ethyl Fluid in Germany in proportions based primarily on their use of Ethyl Fluid.

(5) Means are to be found to prevent any party from competing with Ethyl as long as he remains associated with the others in Ethyl. A suggestion is that he should, if he desires to compete, offer to his associates in Ethyl the option to buy him out or to sell out to them.

EXHIBIT No. 148

HEADS OF AGREEMENT RELATING TO THE MANUFACTURE AND SALE OF ETHYL FLUID IN ITALY ETC.

1. There shall be organized an Italian company under the name "Montecatini Derivati di Piombo" with a real capital of approximately Lire 2,500,000, provided in equal amounts by Montecatini and a new Italian company called "Ethyl S. A. I." hereafter referred to. The shares of Montecatini Derivati di Piombo shall be taken equally by Ethyl S. A. I. and Montecatini, and each party shall agree not to sell, transfer, or otherwise dispose of any of the shares so acquired without the consent in writing of the other.

Montecatini Derivati di Piombo shall erect, under plans and specifications provided by Ethyl S. A. I., a plant for the manufacture of Ethyl brand antiknock compound. This plant shall have an initial production capacity of approximately 100 tons per annum of tetraethyl lead (being approximately 150 tons of Ethyl Fluid). Montecatini Derivati di Piombo shall manufacture tetraethyl lead, and shall also manufacture the ethyl chloride used in the manufacture of tetraethyl lead and may also convert bromine to ethylene di-bromide for use in Ethyl Fluid. It shall purchase the other materials used in the manufacture of tetraethyl lead and Ethyl Fluid wherever available at the lowest cost, preference being given always to Italian sources of supply.

Digitized by Google

2. (*a*) Montecatini Derivati di Piombo will obtain from the Ethyl Gasoline Corporation an exclusive license for Italy and the Italian Colonies under all of the present and future patents controlled by Ethyl Gasoline Corporation relating to the manufacture and composition of Ethyl brand anti-knock compound, and the present patents of the Dupont Company for improvements in the manufacture of tetraethyl lead. The Ethyl Gasoline Corporation will also give to Montecatini Derivati di Piombo its present and future technical experience and information relating to the same products. The foregoing obligations shall continue so long as Ethyl S. A. I. remains a shareholder of Montecatini Derivati di Piombo, or so long as Ethyl Gasoline Corporation shall remain in the business of manufacturing and/or selling the product in question, whichever is the greater in point of time. Further Ethyl Gasoline Corporation will give to Montecatini Derivati di Piombo the technical information and experience to date (but not for the future) of Dupont in the manufacture of tetraethyl lead. If Dupont wishes to obtain the benefit of any future improvements of Montecatini Derivati di Piombo relating to the manufacture of tetraethyl lead, it must agree to pass on to Montecatini Derivati di Piombo its own future improvements relating to the manufacture of tetraethyl lead.

(*b*) Montecatini will grant to Montecatini Derivati di Piombo an exclusive license under its present and future Italian patents (including patents granted by Italian Colonies) relating to the same products, and its present and future technical experience and information relating to the same products.

(*c*) Montecatini will also grant to Ethyl Gasoline Corporation through Montecatini Derivati di Piombo the exclusive right outside of Italy and the Italian Colonies to all of Montecatini's patents and technical experience and information relating to the same products, provided that Ethyl Gasoline Corporation may not grant licenses under such patents nor give such technical information or experience to anyone who does not transmit to Montecatini Derivati di Piombo through Ethyl Gasoline Corporation an exclusive right for Italy and the Italian Colonies in the same field. The term of the obligation covered by this paragraph (*c*) shall be contemporaneous with the term of the like agreements between Standard Oil Company (New Jersey) and General Motors Corporation and Ethyl Gasoline Corporation.

(*d*) In addition to the rights granted under paragraph (*c*) above, Montecatini Derivati di Piombo will grant to Ethyl Gasoline Corporation the exclusive rights for the world outside of Italy and the Italian Colonies in respect of its future patents, technical information, and experience, relating to the products covered by this agreement. This obligation shall continue so long as Ethyl S. A. I. remains a shareholder of Montecatini Derivati di Piombo, or so long as Ethyl Gasoline Corporation shall remain in the business of manufacturing and/or selling the product in question, whichever is the greater in point of time.

(*e*) Neither party shall be obligated to disclose to Montecatini Derivati di Piombo, nor shall the latter be obligated to disclose to Ethyl Gasoline Corporation or Ethyl S. A. I., any new technical information relating to the manufacture, composition, or use of antiknock compounds until such time as proper military authorities have passed upon the military value of such data and given approval for such release, and even if such approval be so obtained, there shall be no obligation for any party to make a disclosure to any of the others in respect of any antiknock compound other than tetraethyl lead and Ethyl Fluid.

(*f*) Montecatini Derivati di Piombo shall pay to Ethyl Gasoline Corporation, after having obtained permission from the Italian Government to make remittances, the nominal sum of $1,000 per annum in United States currency. This sum shall be payable for experience and technical assistance given by Ethyl Gasoline Corporation to Montecatini Derivati di Piombo. This sum shall be payable for the first five years of the term of this contract and no longer. With the exception of this payment, no other shall be payable to any party for any licenses granted under this agreement.

(*g*) It is understood that under the foregoing arrangement, no licenses are to be exchanged by the parties in respect of the manufacture of raw materials used in the manufacture of tetraethyl lead or for the manufacture of other components of Ethyl Fluid.

3. (*a*) Montecatini Derivati di Piombo shall be obligated to offer to the Ethyl Export Corporation (a subsidiary of the Ethyl Gasoline Corporation) at the export price specified in paragraph 3 (*b*) hereof the difference between one hundred (100) tons Tetraethyl Lead and the requirements of Ethyl S. A. I. to satisfy the Italian market inclusive of the Italian Colonies plus the requirements for military purposes referred to in paragraph 4 hereof. In the event the Ethyl Export Corporation should decline to purchase any part of the quantity thus required to

Digitized by Google

be offered, Montecatini Derivati di Piombo shall have the right to export such part from Italy and sell the same in any country in which the Ethyl Export Corporation is making or entitled to make sales of similar products.

It is further understood and agreed that if and when the internal consumption of Italy justifies larger capacity than 100 tons, Ethyl S. A. I. will agree with Montecatini to enlarge the capacity of Montecatini Derivati di Piombo as required rather than raise any question of importing the excess amount.

Except as provided above, Montecatini Derivati di Piombo shall not export Ethyl Fluid or tetraethyl lead in any form.

(*b*) Ethyl S. A. I. may if it so desires erect facilities for handling and storing, packing and shipping Ethyl Fluid at a location conveniently near to the plant of Montecatini Derivati di Piombo. Ethyl S. A. I. shall accept delivery of Ethyl Fluid manufactured and packed according to specifications fixed by it and in containers supplied by Ethyl S. A. I. in approximately even quantities throughout the year, either at its own plant above-mentioned or delivered to transportation companies for direct shipment to customers as Ethyl S. A. I. may direct.

The price of deliveries for domestic and export shall be as follows:

For domestic deliveries Ethyl S. A. I. shall fix the price paid by and the terms of sale to consumers in Italy from time to time at its discretion. The principle shall be that the price shall be the same for all consumers, and shall be the same price paid by consumers in other countries, except to the extent that higher costs or taxes or other conditions peculiar to the Italian market may require a higher price. Ethyl S. A. I. shall return to Montecatini Derivati di Piombo the proceeds from the sales of all Ethyl Fluid delivered to it on the price basis above fixed, after deducting the total expenses the Ethyl S. A. I. shall justify it has incurred relating to medical and technical control and to any other requirements for sale and propaganda of the product, which total expenses shall not exceed in any one year the sum of Lire 120,000 and a commission of 7% of the sales price on all sales made within Italy and the Italian Colonies.

It is understood and agreed that this figure of Lire 120,000 shall be either increased or decreased annually, proportionate with increases or decreases respectively in the average between the cost of the manufacture of Ethyl Fluid and the sales price thereof taken over the year in question. The standard by which it shall be determined whether or not such figure of Lire 120,000 shall be increased or decreased shall be the average between the manufacturing cost and the sales price for the first full year of operation under this agreement.

It is understood that in addition to the price of Ethyl Fluid, Ethyl S. A. I. may charge the customer at cost for packages and similar items; such cost items incidental to deliveries are not to be regarded as part of the sales price for any purpose.

For export, the price shall be the average internal price less freight, taxes and duties realized in the various foreign markets (i. e. markets outside the United States of America and Canada and Italy and the Italian Colonies) supplied through Ethyl Export Corporation by imports, less a commission of 10% of the sales price.

It is noted that Ethyl Export Corporation does not handle the Canadian business, which is handled directly by imports through Ethyl Gasoline Corporation in the United States.

4. The right of selling and delivering directly to the Italian Government supplies of products covered by this agreement and which supplies are to be used solely for military purposes, shall be reserved exclusively to Montecatini, to which company Montecatini Derivati di Piombo shall pay on the proceeds of such sales a commission equal to 7% of the sales price. With the exception of the sales and deliveries to the Italian Government for military purposes which are reserved to Montecatini by this paragraph, all other sales of the production of Montecatini Derivati di Piombo shall be executed through Ethyl S. A. I.

5. Neither Montecatini nor Ethyl Gasoline Corporation shall compete in any way with Montecatini Derivati di Piombo or Ethyl S. A. I. in the manufacture or sale of Ethyl Fluid or tetraethyl lead in Italy and the Italian Colonies, and Montecatini shall not engage directly or indirectly in the manufacture or sale of tetraethyl lead or Ethyl Fluid outside of Italy, except through Montecatini Derivati di Piombo as herein provided.

VERNON-BENSHOFF COMPANY,
Pittsburgh, Pa., March 15, 1940.

RÖHM & HAAS COMPANY,
222 W. Washington Square,
Philadelphia, Pennsylvania.
Attention: Dr. D. S. Frederick.

DEAR DR. FREDERICK: Our discussion of the Pure Food and Drug law and pulling the acrylic denture under it leads me to wonder if the manufacturers of the commercial molding powders might not add an ingredient which would not effect the molding properties, but which would disqualify it under the act. Apparently a slight trace would suffice. Naturally it would be omitted from the strictly denture powder.

Recently I asked Dr. Johnson to suggest an addition which might interfere with distillation of monomer or retard polymerization. He could not think of anything that wouldn't spoil the molding properties or clarity of the powders. But there the quantity needed to accomplish the result was the handicap.

Under the very finicky regulations of the above act however, it may be the slightest trace of the right agent, too little to constitute harm to molding (or health either as a matter of fact) would suffice to have bootleg products in bad.

A millionth of one percent of arsenic or lead might cause them to confiscate every bootleg unit in the country. There ought to be a trace of something that would make them rear up.

Very truly yours,

VERNON-BENSHOFF COMPANY,

Vernon-Benshoff Company,
P. O. Box 1587, Pittsburgh, Pa.

DEAR MR. VERNON: In reference to your letter of March 15th, we shall be glad to investigate whether denture materials come under the Pure Food and Drug Act. We agree with you that if we could put some ingredient in our commercial molding material which would disqualify it under the Pure Food and Drug Act, this would be a very fine method of controlling the bootleg situation. We shall take this matter up with our development department and advise you whether any such material could be used.

Very truly yours,

RÖHM & HAAS COMPANY,
D. S. FREDERICK.

Wilmington, Delaware, June 26, 1940.

Confidential.
Dr. H. A. LUBS, Chemco. Dir.,
Chemical Division.

Minutes of conference on "Monastral" colors for paint and dye pigments in Wilmington, on June 18, 1940

Those present were: Dr. Gubelmann, Dr. Elley, Dr. Lubs, Mr. Tinker, Dr. Stallmann, Dr. Black, Dr. Chantler, Dr. Echlen, and the writer.

Mr. Protto was present during the closing minutes.

Dr. Gubelmann requested Dr. Black to read a copy of the latter's letter of June 18 in which was outlined the finishes in which "Monastral" colors are used, pigments being replaced, and the advantages and disadvantages of the phthalocyanines in comparison with other pigments.

The purpose of the conference was to organize the material to be discussed with representatives of G. A. F. on Monday, June 24. Three problems had been

Digitized by Google

presented G. A. F. to serve as a basis for the discussion: (1) Production of a lower priced pigment for the paint trade of such properties as to be unsuitable for textile printing, (2) elimination of bronzing, and (3) increasing the can stability of the pigment.

Dr. Gubelmann was of the opinion that only such points, on which experimental work had been done, should be discussed with G. A. F.

(*1*) *Pigments Unsuitable for Textile Printing.*

(*A*) *Mixtures with Other Pigments.*—Mixtures of phthalocyanine pigments with carbon black, indigo, iron blue and aluminum powder had been made at the Technical Laboratory. In general, the change in shade and the dulling effect were proportional to the amount of diluting pigment added. However, the effect of the addition of other pigments on the utility of the mixtures in textile printing was less than that predicted. Mr. Chantler was of the opinion that pigment mixtures unsuitable for textile printing would be very difficult to obtain.

(*B*) *Agents Injurious to Textile Printing.*—The suggestion was made that certain compounds that were white under ordinary conditions but that would be oxidized to give colored bodies when the prints are subjected to chlorine bleach, could be used. A few experiments had been made along this line using such compounds as Chlorestain N, dianisidine and DuPont Oxy Black Base. Complete data on this work are not available. Dr. Dahlen expressed the opinion that the addition of such compounds probably would cause as much or more damage to the paint trade as to textile printing.

Such substances as ground glass and carborundum were suggested for incorporation with the pigment. While these materials would undoubtedly scratch printing rolls, there is considerable doubt as to their effect in paints and lacquers.

(*2*) *Bronzing.*

Dr. Black stated that considerable evidence had been obtained that bronzing was caused by a pigment-air interface. Exposure of the pigment particles was due to film decomposition and not to pigment migration to the surface. The attack on this problem had been directed toward coating the pigment particles with substances more resistant to weathering than the paint film itself. The agents used and results obtained are tabulated below:

Agents	*Results*	
Silicates	Less bronzing	Too hard to grind
Casein	" "	" " " "
Glyptal Resins	" "	Very hard
Urea-Formaldehyde	No data	No data
Nylon	" "	Fairly soft
Rosin-Maleic Anhydride	" "	No data
Bedafin Type [1]	" "	" "

[1] I. C. I. reports less bronzing.

Dr. Gubelmann suggested that a noncrystalline copper phthalocyanine structure could be obtained by reacting tetra-amino-CPC with agents that would cause a large increase in the size of the molecule.

(*3*) *Can Stability.*

Copper phthalocyanine and metal-free phthalocyanine exhibit a marked loss in strength when ground in certain vehicles and stored for some length of time. This has been proved to be due to crystallization of the pigment from components of the vehicle. Specifically, aromatic type hydrocarbons seem to cause marked crystallization. The methods of attack on this problem and the results obtained are as follows:

A. Partial Chlorination of the CPC.—I. C. I. reported improvement in can stability and now produce a partially chlorinated brand known as "Monastral" Fast Blue LBS. Technical Laboratory tests have not confirmed this observation.

B. Coprecipitation of Various Metal Phthalocyanines.—Various metal phthalocyanines such as Al, Ni, Pb, Fe, and Co have been copasted with copper phthalocyanine. No improvement in can stability was observed.

C. Coating with Solvent Insoluble Materials.—All of the coated products produced for test as a nonbronzing pigment have been tested for crystallization from

Digitized by Google

boiling xylene. The latter test is somewhat rigorous but indicative of the behavior of the pigment when stored for some time. The results are tabulated below:

Agents	*Results*
Silicates	Very little crystallization
Glyptal resins	" " "
Urea-Formaldehyde	Marked "
Bedafin Type resin	Little "
Nylon	Very little "

D. Use of Other Solvents in Vehicle Formulation.—Oxygenated solvents and aliphatic hydrocarbons were shown to decrease the amount of crystallization of the CPC. However, the use of such solvents causes other effects in the paint, equally serious in nature.

The conclusions reached at the conference may be summarized as follows·

1. G. A. F. will be asked to exchange samples together with a synopsis of the method of preparation of all new developments pertaining to the above problems.
2. DuPont will disclose to G. A. F. such information on which experimental data have been obtained.

MEMORANDUM OF DISCUSSION BETWEEN REPRESENTATIVES OF GENERAL ANILINE WORKS AND DUPONT COMPANY

[Confidential]

Subject

1. A new type of copper phthalocyanine (CPC) for the paint and lacquer trade which would be unsuitable for application on textiles.
2. Elimination of bronzing of CPC blue and green.
3. Improvement of the can stability of CPC blue in paints.

The meeting was held in Dr. I. Gubelmann's office, June 24 at 11:00 A. M.

Present: Representatives of G. A. W.—Dr. Max, Mr. Bonnar, Mr. Henlein; DuPont—Dr. I. Gubelmann, Mr. A. R. Chantler, Dr. H. A. Lubs, Dr. C. K. Black, Mr. J. M. Tinker.

The importance of solving these problems was recognized, and it was agreed that both parties would work on promising ideas which resulted from this discussion. The three problems are closely related, and it is possible that the solution of one or two will automatically solve the third. It was agreed that a powder would be the preferable standard. After detailed discussion of various modes of attack, the following appeared to be outstanding:

1. (*a*) *Mixtures of CPC with Lakes.*—The most promising mode of attack appears to lie in the formulation of a mixture of CPC with a lake, especially a lake of CPC. Such a mixture should have fairly good fastness to light and yet be poor in wash fastness on textiles or incompatible with the usual textile printing lacquers. A wide variety of various alkaline earth and metal salts of sulfonated CPC containing 1, 2 or 3 sulfonic acid groups will have to be prepared and tested in varying amounts with dispersed CPC. Lead and titanium salts should be particularly studied. The use of inorganic pigments for admixture with CPC does not look as attractive. A resinated CPC will be tested on textiles since it is known to be satisfactory for surface coating compositions.

(*b*) *Use of Plasticizers.*—It was believed that plasticizers might be incorporated into CPC which should not hurt surface coating compositions but would decrease the crocking fastness when applied to textiles. Various high melting waxes, stearic or other high molecular weight acids will be tried.

Digitized by Google

(*c*) *Use of Driers.*—It appears possible that a limited amount of a drier might be incorporated into CPC which would make the textile print boardy, particularly at the temperature of the dry can and yet might not interfere with can stability and paint properties.

(*d*) *Deteriorate Cotton.*—Compounds might be incorporated into CPC which when applied to textiles and followed by bleaching or heating treatment might increase the deterioration of the cloth. Compounds such as chlorates or aliphatic halides which would produce hydrochloric acid were specific examples.

(*e*) *Color Forming Substances.*—Compounds which in themselves are normally colorless which would produce highly colored products when treated with bleach might be incorporated so as to make their use in textiles unsuitable.

(*f*) *Emulsion Breakers.*—Compounds might be added to CPC which would give poor emulsions when attempts were made to use them as textile printing. It might be possible to make them unsuitable for one type of emulsion, such as water-in-oil, but it may be difficult to make them also unsuitable for the oil-in-water type. The incorporation of a colloid, such as Bentonite, might make printing pastes thick.

(*g*) *Irritating Substances.*—It is known that certain resins and solvents are irritating to the skin, often causing dermatitis. It might be possible to formulate a CPC composition which will make textile materials irritating to the skin.

(*h*) *Incorporation of Grit.*—It seemed too dangerous to attempt to add gritty material to CPC since, although it would interfere with the use of the material for textiles, it would also offer serious disadvantages in grinding on application of surface coatings.

It was agreed that the mere dulling of the material would not be a satisfactory solution since dull shades are often used in the textile trade. Most of the above comments were based on work on blue, and many of the solutions would apply equally well to the green. In fact it is believed that there is a larger market for the sale of green than the blue.

2. *Elimination of Bronzing of CPC Blue and Green.*—We have been successful in eliminating or retarding bronzing by coating the CPC particle with a very hard insoluble resin. This has led to a material which is very difficult to grind and results in hard, horny material unsuitable for paint. G. A. W. have had some success in the use of high melting waxes in paint compositions and which apparently reduced bronzing. Both these methods of attack should be continued including attempting to coat the particle by means of special processes, such as the Harmon soft powder method or spray drying technique. Mixtures of CPC and indigo are fairly bright and should materially reduce bronzing, particularly if the indigo which does not bronze were coated on the CPC particle. Attempts will be made to prepare further samples along this line.

The use of ultra-violet light absorbing compounds is to be considered since we agree that bronzing is caused by the deterioration of the plastic film, which in turn is accelerated by ultra-violet light. Various compounds which are not highly colored but which fluoresce in daylight are suitable candidates.

Mr. Chantler will obtain samples of a nitro-cellulose composition which both parties will use for preliminary bronzing tests. When a promising lead is obtained, other vehicles will be studied.

3. *Improvement of the Can Stability of CPC Blue in Paints.*—We have considerable evidence that the poor can stability of CPC paints is due to crystal growth. The solvent has a marked effect, the aromatic hydrocarbons being the poorest. Oxygen-containing solvents and aliphatic hydrocarbons are more suitable. The results are not entirely consistent and it was brought out that traces of metals, such as copper, might catalyze the crystallization. It is known that mixtures of CPC and cadmium colors fade out in the can with a loss of blue. Traces of copper salt will be added to metal-free samples to check this point. It was also suggested that the solder in the can may be a promoter.

Dr. Max agreed to send a pound of crude urea process CPC, free of chlorine, which we shall make into a paint and study its crystal growth. We have had some evidence that the mixture of CPC and lever chlorinated CPC is more stable to can fading. It is possible that the chlorine-free product will have poorer can stability than the impure chlorine-containing mixture.

Both Mr. Chantler and Mr. Bonner will obtain samples of a clear lacquer suitable for textile application and half of the supply will be sent to the other party, so that we can study textile printing in the identical lacquer composition.

It was agreed that both parties make every effort to solve these problems as soon as possible since complete tests will require long periods of study before products can be adopted. We shall keep in close touch with each other on any promising

Digitized by Google

leads, so that no effort need be lost on less promising work. The next meeting will take place on Monday at 10:00 A. M., July 29, at the G. A. W. offices on the 7th floor at 435 Hudson Street, New York.

EXHIBIT No. 153

OCTOBER 20, 1943.

The Hon. HARLEY M. KILGORE,
Committee on Military Affairs, United States Senate, Washington, D. C.

MY DEAR SENATOR KILGORE: In his prepared statement before your committee on October 15, the Honorable Wendell Berge, Assistant Attorney General in charge of the Antitrust Division, Department of Justice, quoted excerpts from a confidential memorandum of March 29, 1935, dealing with the development of 100 octane aviation gasoline.

Possibly because he was unaware of the full correspondence, Mr. Berge overlooked calling to your attention that on December 27, 1935, General Oscar Westover, Chief of the U. S. Air Corps, advised us as follows:

> *"It has been decided that the military status of high anti-knock fuels shall be non-secret, as regards release of information, both in this country and abroad."*

Let us look at the full story. Mr. Berge cited the aforementioned excerpts to substantiate his thesis that our company—among others—had found itself "in a position where it must choose between the national interest on the one hand and its cartel obligations on the other." It seems to us unfortunate that Mr. Berge did not present the memorandum as a whole and the documented circumstances surrounding it. A photostat of Mr. Howard's memorandum in its entirety is attached hereto.

What Mr. Berge pictured as a "cartel obligation" was Standard's agreement to exchange information on the technical development of the hydrogenation process with I. G. Farbenindustrie. The Germans had originated this process themselves. When Standard bought an 80% interest in the process for the world outside of Germany in 1929 it wanted also to obtain the benefit of all the future German improvements. The way it got these improvements was through the exchange agreement.

Standard always received more technical information than it gave under this agreement, because Germany did a great deal more work on hydrogenation than all the rest of the world put together.

Our peacetime exchange of technical data was, therefore, a normal and proper incident to the purchase of a patented process and one which has brought almost unlimited benefits to the United States. But whatever name is applied to this contract, the simple fact remains that it was not the cause of the difficulties.

The whole point of the discussion in Mr. Howard's confidential memorandum to the heads of our company was simply that to do what the Army suggested—that is, *to keep secret* the development of 100-octane gasoline in this country—was an extremely difficult task. As Mr. Howard said, it "bristled with difficulties." This the Army later realized.

These difficulties become obvious when you realize that at that time, the following companies were entitled, *under contracts made with them*, to receive information regarding improvements and developments on the hydrogenation process by which we proposed to help the Air Corps develop its superior aviation fuel:—

Atlantic Refining Company,
Barnsdall Corporation,
Cities Service Company,
Continental Oil Company,
I. G. Farbenindustrie,
Imperial Chemical Industries of Great Britain,
Mid-Continent Petroleum Corporation,
Royal Dutch Shell,
Shell Union Oil Corporation,
Sinclair Refining Company,
Skelly Oil Company,
Socony-Vacuum Corporation,
Standard Oil Company of California,
Standard Oil Company (Indiana),
Standard Oil Company (Ohio),
Standard Oil Development Company,
The Pure Oil Company,
The Texas Company.

Digitized by Google

Mr. Berge has failed to report that in spite of such difficulties, *we did what the U. S. Army Corps wanted done.* He has apparently overlooked the fact that the Army Air Corps advised us on December 27, 1935

> *"It has been decided that the military status of high anti-knock fuels shall be non-secret, as regards release of information, both in this country and abroad."*

The question of the memorandum from which Mr. Berge quoted was raised before the Senate Committee on Patents on Wednesday, August 19, 1942. Since it was the purpose of your Committee to get at the whole facts of these matters, it seems to us unfortunate, also, that Mr. Berge ignored the discussion before that Committee on page 5100 of the Committee's published hearings.

Here are the facts in this matter:

1. During the week of March 18, 1935, the U. S. Army Air Corps told us informally that it would like us to bid on a proposal for a limited quantity of 100-octane aviation gasoline and that they would like to discuss with us the technical situation with regard to supplies and quality of improved aviation gasoline.

2. Mr. R. P. Russell, Vice President of the Standard Oil Development Company and the man in our organization best qualified, promptly spent two days in Washington discussing the matter.

3. Mr. Howard's memorandum of March 29th reported developments to that point. You will find in it no suggestion of any attempt on our part to find an alternative to doing our best to help the Army Air Corps to achieve its objectives. It simply points out the difficulties to be solved.

4. On April 19 again Mr. Howard called attention to the fact that our Development people could not see "how it is going to be possible as a practical matter to long withhold the information from the companies associated with us in the hydrogenation pool." He asked permission to explain the situation in detail to Army authorities and "make it clear that the difficulties in the way of attempting to maintain absolute secrecy concerning methods of production of this material seems to us too great." (Photostat of this letter is attached hereto.)

5. On June 28, 1935, the whole matter was laid out in a four-page letter from Mr. Guy Wellman, General Counsel of our company, to Major C. W. Howard, Aide to the Chief of the Army Air Corps, War Department. (Photostat of this letter is also attached hereto.)

6. On December 11, 1935, Mr. Howard wrote General Oscar Westover, Assistant Chief, Army Air Corps. (A photostat of this letter is also attached hereto.) As you will see, Mr. Howard asked General Westover specifically:

> (*a*) "Is there any reason why we should further postpone performance of our contractual obligations to pass on to our American associates in the Hydro Patents Company, to the International Hydrogenation Engineering & Chemical Company at The Hague, and the I. G. Farbenindustrie in Germany, the results of our development work on the production of high octane (95 or better) aviation gasoline by hydrogenation? * * * ".
>
> "(*b*) Is there any reason why we should refrain from contracting through our European affiliates for the supply of iso-octane in large quantities to French, German, and English air lines or governments? * * *"

7. On December 27, 1935, General Westover replied to Mr. Howard's letter. (A photostat of that reply is also attached hereto.) You will note the following statement in that letter:

> *"It has been decided that the military status of high anti-knock fuels shall be nonsecret, as regards release of information, both in this country and abroad."*

The record shows that, years before war broke out, the U. S. Army worked out, with the help of American industry, a program by which it was the first fighting force in the world to standardize on 100-octane gasoline, and it was the only fighting force so standardized when the European War broke out in 1939. The program was successful from the beginning, and was a real basis for the most important military superiority which the United States had over the other countries when war came.

We are very proud of the fact that the essential basis of this program was the cooperation given the Air Corps by our company, both in the original research work and in the initial commercial production. I know that you will appreciate our keen desire to see that this record remains unsmirched by misrepresentation or innuendo.

Digitized by Google

The record shows that, seven years before our country went to war, we were doing our best to help make our country strong in the event of war; that when questions of policy arose which involved foreign countries, we sought the advice of the Army or the State Department and followed their instructions. What else, Senator, would you have had us do?

I am writing this letter in the absence of Mr. Gallagher, who is out of town on an extended business trip. If you consider the request in order, we should like to have this letter and its enclosures made a part of the record of the Hearings of your Committee.

Sincerely yours,

R. T. HASLAM

RTH.HG

cc—The Honorable Wendell Berge, Assistant Attorney General, in charge of the Anti-Trust Division, Department of Justice, Washington, D. C.

[Confidential]

MEMO FOR MESSRS. TEAGLE AND FARISH

During the week of March 18th we received word informally that the Army Air Corps would like us to bid on a proposal they were just making for a limited quantity of 100 octane number aviation gasoline, and that they would also be glad of an opportunity to discuss with us, from a technical standpoint, the situation with regard to supplies and quality of improved aviation gasoline. We have always put ourselves entirely at the disposal of the fighting services in matters of this kind. Therefore, Mr. R. P. Russell, Vice-President of the Standard Oil Development Company, who is the best qualified man in our organization, spent two days in Washington discussing the whole question of present and probable future availability of improved aviation gasoline. The position, general program, and desires of the Army Air Corps in this matter were covered in full by Major C. W. Howard, who is Assistant to the Chief of Air Corps, and confirmed by General Foulois, Chief of the Air Corps. The technical and research situation in the oil industry in general and especially in our group of companies, and the present and probable future availability of supplies in the United States and foreign countries, was covered without reservations by Mr. Russell. The purport of these discussions was about as follows:

The Army Air Corps is proceeding at once on a limited program of procurement of 100-octane number fuel. The only known means of getting a satisfactory quality of such fuel at the present time is by blending with regular aviation gasoline 50% of iso-octane together with tetraethyl lead in normal amounts. Supplies of iso-octane are at the present time extremely limited. So far as we know the Shell Company and ourselves are the only present suppliers. Our supplies are inadequate for our own commercial needs and we have no desire to quote on Government business in the near future. Nevertheless Mr. Russell agreed to recommend doing everything possible to speed up production and enlarge the supply of iso-octane and to bid on the Air Corps contracts at the earliest practical moment. Mr. Russell has fulfilled this promise under date of March 28th, by letter copy of which is enclosed, and which is now being forwarded to the Co-Ordination Committee for immediate action on the necessary appropriations.

The use of iso-octane for producing improved aviation gasoline and the method of its manufacture are known outside of the United States and it is probable that the air forces of the entire world will be doing experimental work with iso-octane and concentrating their intention on its availability to them.

The difficulty with iso-octane is that the production at the present time is limited to the utilization of the by-product iso-butylene present in gases formed by the cracking process. The amount available is roughly of the order of ¼ of 1% of the gasoline produced. This small amount is entirely adequate for development work and extensive flight testing. It is even adequate for peace-time military and naval aviation use in a large part of the world at least. It is totally inadequate for any war-time use.

It appears, therefore, that any program of the air forces involving the use of high-powered engines which require 100-octane number fuel must depend upon the oil industry finding some way of producing iso-octane in quantities much larger than are available at the present time, or finding some other method of producing a satisfactory quality 100-octane number fuel.

Digitized by Google

The first possibility, that, is the production of large quantities of iso-octane, is very unattractive because of the costs, time required, and losses and difficulties which appear to be involved. While synthesis is possible the supplies seem to be too far ahead and to expensive to be of present military importance.

On the second possibility, the prospects seem to be good. We have produced experimentally, by hydrogenation, aviation gasoline of the required characteristics which looks as though it would be satisfactory, although it is too early to make a definite promise. The advantage of this product is that with our 10,000 barrels per day of hydrogenation capacity and with ample quantities of the right quality of feed stock instantly available to us in the United States, we could make the required gasoline from the beginning of hostilities onward at rates much faster than it could possibly be required by our air forces.

Assuming that the present promise will be borne out, it therefore appears that our cooperation with the fighting forces will permit of a practical and satisfactory program for converting our entire fighting aviation equipment over to 100-octane number standard. Roughly this means for the same weight and size the engines would have 25% more power than the engines adapted for the best fuel available today (87 octane number). The transition stage of this development for our fighting forces can be taken care of by iso-octane production and perhaps by various other small scale specialty operations of other suppliers. It seems possible that full peace-time requirements for the United States Army and Navy might also be taken care of in this way if the entire domestic production of iso-octane was reserved for that purpose. This program of change-over could safely be undertaken immediately because of the availability of the requisite large quantity of fuel which could be produced by hydrogenation in case of war. If we are successful in our present experiments our Army Air Corps can therefore proceed at once with full confidence on a program of engine improvement based on superior fuels which will put them far ahead of the rest of the world as regards performance of their fighting equipment.

This possibility is of course extremely attractive to the Army Air Corps but there is one difficulty involved which Mr. Russell quite frankly discussed. The hydrogenation development originated in Germany and through cooperation all around has now passed into the hands of the oil industry of the entire world, and to a certain extent, into the hands of the foreign chemical industry as well. There is a full and free exchange of technical information between all of the companies and units involved in the hydrogenation development and this exchange is not only by means of reports but by constant visits of technical men. To cut off these reports and shut our hydrogenation plants against these visitors would be not only a violation of these agreements which would involve us in many difficulties, but would also be tantamount to a confession that we were engaged in some work of special military value which would mean that the plants would become a focal point for espionage. The costs and difficulties of protecting against leakage of information about large commercial operations under such conditions is hard to estimate. It seems that the only practical way to handle this problem is to avoid carrying out the operation of producing 100-octane numberaviation gasoline commercially as long as possible. We would, of course, also have to breach our agreements to render full and complete technical reports to all of the companies associated with us (even to the American companies, for fear of leakage). We should also forfeit the advantage in producing at the least cost the best available gasoline for commercial purposes.

Any program by which the Army Air Corps can obtain their objective of a one or two year start over the rest of the world on this vital matter bristles with difficulties and sacrifices from our standpoint. We will not have to cross the bridge finally until our present experiments are completed. When and if we are able to demonstrate that the hydrogenation plants are capable of turning out an aviation product which with the usual quantity of lead can be brought up to 100-octane number, we shall be faced with the situation mentioned above. To meet the very proper desires of the Air Corps as expressed to us we shall have to violate our agreements and perhaps forfeit the confidence of our associates, both American and foreign, and beyond this we shall either have to avoid any commercial use of the new method or run the very grave risk of finding that our efforts at secrecy have been abortive.

Digitized by Google

DECEMBER 11, 1935.

Special Delivery

Brigadier General OSCAR WESTOVER,
Assistant Chief, Army Air Corps., Washington, D. C.

MY DEAR GENERAL WESTOVER: I should appreciate your advice on the following points:

ISO-OCTANE

1. Is there any reason why we should further postpone performance of our contractual obligations to pass on to our American associates in the Hydro Patents Company, to the International Hydrogenation Engineering & Chemical Company at The Hague, and the I. G. Farbenindustrie in Germany, the results of our development work on the production of high octane (95 or better) aviation gasoline by hydrogenation? You will remember this is a subject on which we have had much discussion in the past.

2. Is there any reason why we should refrain from contracting through our European affiliates for the supply of iso-octane in large quantities to French, German, and English air lines or governments? There is a very active interest in this question at the present time and the normal policy of our European affiliates would be to follow up this business and to endeavor to supply any demand which exists. The effect will be to stimulate interest in the development of engines to make use of this product abroad and to drain from America a small inventory which might accumulate here. On the other hand, the effect of a world-wide stimulation of this business will unquestionably be to stimulate production in the United States and thus increase the supply potentially available for American consumption at any time.

3. As a direct indication of the effect of increased interest both outside of and within the United States on the stimulation of production of iso-octane, we beg to advise you that we have under active consideration at this moment two projects, one for the production of 1,000 barrels per day and another for the production of 250 barrels per day of iso-octane within the United States. Assuming that the interests of the service would permit you to express such an opinion, I would appreciate very much your opinion as to whether we may look forward to such a probable expansion of the high octane gasoline business as to justify us in considering that this additional output of iso-octane will probably be needed for the calendar year 1937, which would be about the earliest time the whole increase could be brought into production.

Very truly yours,

FRANK A. HOWARD.

FAH:CFG-VLW
CC: Mr. R. P. Russell

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF THE AIR CORPS,
WASHINGTON, *December 27, 1935.*

Mr. FRANK A. HOWARD, *President,*
Standard Oil Development Company,
26 Broadway, New York, N. Y.

DEAR MR. HOWARD: This is in reply to your letter of December 11, 1935, subject, Iso-Octane.

It has been decided that the military status of high anti-knock fuels shall be nonsecret, as regards release of information, both in this country and abroad. The foreign sale of iso-octane and other high anti-knock fuels is a matter which comes under the jurisdiction of the State Department rather than the War Department.

In regard to future procurement of 100 octane fuel, it is not possible at the present time to determine just how much will be procured by the Air Corps during the calendar year 1937. The present total fuel consumption in all types of engines in the Air Corps is less than half the quantity of 100 octane fuel which can be blended from 1,000 barrels of iso-octane per day, so that, obviously, the Air Corps cannot possibly use such a quantity of iso-octane with present peacetime

Digitized by Google

strength. It is possible that the Bureau of Aeronautics, Navy Department, will procure iso-octane blends in the future and that they will be valuable for commercial use as well. That, of course, is a matter on which the Air Corps is not in a position to give any definite information.

Very truly yours,

O. WESTOVER,
Major General, Air Corps,
Chief of the Air Corps.

JUNE 28, 1935.

Major C. W. HOWARD,
War Department, Office of the Chief of the Air Corps,
Washington, D. C.

DEAR SIR: Referring to the conference had by you with Messrs. F. A. Howard, R. P. Russell, and myself, and to your request that we refrain from disclosing to others our latest developments in the production of aviation gasoline by hydrogenation, this will confirm our statement to you that we desire to cooperate in line with your request subject, however, to important contract obligations, which we have, to disclose to the licensees of the hydrogenation process all information regarding developments and improvements in products.

The hydrogenation process as used herein means the process of treating carbonaceous substances, specifically coal or oil, with hydrogen under reacting conditions to produce oil products. If coal be the material treated, the first product is a synthetic crude oil. This synthetic crude oil or any other oil may also be treated in a variety of ways by the hydrogenation method to yield practically all types of marketable petroleum products, including especially gasolines of various qualities.

This process originated in Germany and was developed there to a considerable extent as applied to coal before the Standard Oil Company (New Jersey) acquired any interest in it. In 1927 the latter company made an agreement with I. G. Farbenindustrie A. G. to join in the development of the process for oil refining and to take over an interest in the U. S. patent rights only. On November 9, 1929, the limited agreement above referred to was superseded by a general agreement by which the hydrogenation process passed into the control of Standard-I. G. Company, a corporation controlled by Standard Oil Company (New Jersey) but in which I. G. Farbenindustrie A. G. has a substantial interest. The rights transferred covered both coal and oil for all countries outside of Germany. This agreement contained the following provision:

"The parties agree to work together on the technical development of the hydrocarbon field; to communicate to each other during the life and within the scope of this agreement all technical knowledge and experience, past, present and future, patented and unpatented, of which the parties are now possessed or shall hereafter be possessed, in the sense of having the power to dispose of them, and also to help each other in their efforts to obtain adequate patent protection."

The Standard-I. G. Company immediately proceeded to organize a holding company for the United States patent rights. Participation in this company, known as the Hydro Patents Company, was offered to all refiners in the United States having more than 20,000 barrels a day of crude refining capacity. The participations were accepted by the great majority of those to whom the offer was made. As an incident to their participation in the Hydro Patents Company, the American Refining companies, eighteen in number, all took licenses under the hydrogenation process, and through an intermediate Engineering Corporation arranged to exchange their experience and technical improvements with one another, and through Standard-I. G. with the I. G. Farbenindustrie. The contract relations involved in this U. S. set-up are rather complex, but the pertinent point is covered in the following sentence from contract E of the series of agreements:

"Engineering represents and warrants that it is in possession of or has and will have available to it the present and future (until December 31, 1947) experience and technical information and knowledge of I. G. Farbenindustrie Aktiengesellschaft and Standard Oil Company (New Jersey) and all corporations which are in effect the sole property of either or both of them, relating to the Licensed Operation, and is authorized to transmit such experience and technical information to all licensees of Hydro Patents Company. Engineering agrees to give Licensee technical assistance requested in connection with the maintenance, operation, and repair of equipment and will endeavor upon request from time to time to keep Licensee informed as to all technical developments and experience known to Engineering and of use to Licensee in connection with the carrying on of the Licensed Operation."

Digitized by Google

Also the following:

"Engineering shall have access to any and all plants and parts thereof belonging to Licensee in which any part of the licensed operation is conducted at all reasonable hours for the purpose of inspecting the equipment used and the operations conducted therein and Licensee agree to supply to Engineering, for the benefit of all licensees of Hydro Patents Company, any information in its possession concerning the performance of such equipment and the nature and results and all technical details of the operations conducted."

The stockholder licensees of Hydro Patents Company, which are entitled to receive information regarding improvements and developments as well as to give it to other licensees and to the Standard-I. G. for the benefit of Standard Oil Company (New Jersey) and I. G. Farbenindustrie A. G., are as follows:

Standard Oil Company of California
Union Oil Co. of California [1]
Richfield Oil Co. of California [1]
Continental Company
Skelly Oil Company
Standard Oil Company (Indiana)
The Pure Oil Company
Standard Oil Company (Ohio)
Gulf Refining Company [1]
Mid-Continent Petroleum Corporation
Atlantic Refining Company
The Texas Company
Shell Union Oil Corporation
Socony-Vacuum Corporation
Sinclair Refining Company
Barnsdall Corporation
Cities Service Company
Standard Oil Development Company

The Standard-I. G. Company disposed of the patent rights on the hydrogenation process outside of the United States to the International Hydro Patents Company, a foreign corporation owned jointly by foreign subsidiaries of Standard Oil Company (New Jersey) and the Royal Dutch Shell Group. A companion corporation, International Engineering & Chemical Company, assumed technical and engineering activities for International Hydro Patents Company in the same manner in which Hydro Engineering & Chemical Company assumed the same activities in the United States. The two Engineering Companies are bound to exchange their technical knowledge in the same way as earlier quoted.

The International Hydro Patents Company has entered into an agreement with the Imperial Chemical Industries of Great Britain licensing the latter company to conduct the hydrogenation operation in the British Empire. This license contains provisions for exchange of technical information as exemplified in the contracts earlier quoted.

The hydrogenation process is from a technical standpoint one of the most difficult and involved of all industrial operations. The investment required, even for the simplest laboratory work, is very considerable, and the range of technique, experience and skill required for successful operation covers the widest fields of engineering and chemistry. Investment and operating costs are very high and the process cannot be profitably carried on at present except behind high tariff walls or for the production of especially high-quality, high-priced products. All the parties in it, however, recognize its present technical importance and its potential overwhelming industrial importance, if and when either of two contingencies arises:

(*a*) World level of petroleum prices rises materially, or
(*b*) The continued technical improvements in the process further reduce investment and operating costs.

In the entire world there are only five commercial hydrogenation plants in operation at the present time, as follows:

Merseburg, Germany	350,000 tons per annum.
Ludwigshafen, Germany	Small.
Billingham, England	150,000 tons per annum.
Bayway, New Jersey	5,000 barrels per day.
Baton Rouge, La	5,000 barrels per day.

[1] Have not yet signed license agreements, but will probably do so.

strength. It is possible that the Bureau of Aeronautics, Navy Department, will procure iso-octane blends in the future and that they will be valuable for commercial use as well. That, of course, is a matter on which the Air Corps is not in a position to give any definite information.

Very truly yours,

O. WESTOVER,
Major General, Air Corps,
Chief of the Air Corps.

JUNE 28, 1935.

Major C. W. HOWARD,
War Department, Office of the Chief of the Air Corps,
Washington, D. C.

DEAR SIR: Referring to the conference had by you with Messrs. F. A. Howard, R. P. Russell, and myself, and to your request that we refrain from disclosing to others our latest developments in the production of aviation gasoline by hydrogenation, this will confirm our statement to you that we desire to cooperate in line with your request subject, however, to important contract obligations, which we have, to disclose to the licensees of the hydrogenation process all information regarding developments and improvements in products.

The hydrogenation process as used herein means the process of treating carbonaceous substances, specifically coal or oil, with hydrogen under reacting conditions to produce oil products. If coal be the material treated, the first product is a synthetic crude oil. This synthetic crude oil or any other oil may also be treated in a variety of ways by the hydrogenation method to yield practically all types of marketable petroleum products, including especially gasolines of various qualities.

This process originated in Germany and was developed there to a considerable extent as applied to coal before the Standard Oil Company (New Jersey) acquired any interest in it. In 1927 the latter company made an agreement with I. G. Farbenindustrie A. G. to join in the development of the process for oil refining and to take over an interest in the U. S. patent rights only. On November 9, 1929, the limited agreement above referred to was superseded by a general agreement by which the hydrogenation process passed into the control of Standard-I. G. Company, a corporation controlled by Standard Oil Company (New Jersey) but in which I. G. Farbenindustrie A. G. has a substantial interest. The rights transferred covered both coal and oil for all countries outside of Germany. This agreement contained the following provision:

"The parties agree to work together on the technical development of the hydrocarbon field; to communicate to each other during the life and within the scope of this agreement all technical knowledge and experience, past, present and future, patented and unpatented, of which the parties are now possessed or shall hereafter be possessed, in the sense of having the power to dispose of them, and also to help each other in their efforts to obtain adequate patent protection."

The Standard-I. G. Company immediately proceeded to organize a holding company for the United States patent rights. Participation in this company, known as the Hydro Patents Company, was offered to all refiners in the United States having more than 20,000 barrels a day of crude refining capacity. The participations were accepted by the great majority of those to whom the offer was made. As an incident to their participation in the Hydro Patents Company, the American Refining companies, eighteen in number, all took licenses under the hydrogenation process, and through an intermediate Engineering Corporation arranged to exchange their experience and technical improvements with one another, and through Standard-I. G. with the I. G. Farbenindustrie. The contract relations involved in this U. S. set-up are rather complex, but the pertinent point is covered in the following sentence from contract E of the series of agreements:

"Engineering represents and warrants that it is in possession of or has and will have available to it the present and future (until December 31, 1947) experience and technical information and knowledge of I. G. Farbenindustrie Aktiengesellschaft and Standard Oil Company (New Jersey) and all corporations which are in effect the sole property of either or both of them, relating to the Licensed Operation, and is authorized to transmit such experience and technical information to all licensees of Hydro Patents Company. Engineering agrees to give Licensee technical assistance requested in connection with the maintenance, operation, and repair of equipment and will endeavor upon request from time to time to keep Licensee informed as to all technical developments and experience known to Engineering and of use to Licensee in connection with the carrying on of the Licensed Operation."

Digitized by Google

Also the following:

"Engineering shall have access to any and all plants and parts thereof belonging to Licensee in which any part of the licensed operation is conducted at all reasonable hours for the purpose of inspecting the equipment used and the operations conducted therein and Licensee agree to supply to Engineering, for the benefit of all licensees of Hydro Patents Company, any information in its possession concerning the performance of such equipment and the nature and results and all technical details of the operations conducted."

The stockholder licensees of Hydro Patents Company, which are entitled to receive information regarding improvements and developments as well as to give it to other licensees and to the Standard-I. G. for the benefit of Standard Oil Company (New Jersey) and I. G. Farbenindustrie A. G., are as follows:

Standard Oil Company of California
Union Oil Co. of California [1]
Richfield Oil Co. of California [1]
Continental Company
Skelly Oil Company
Standard Oil Company (Indiana)
The Pure Oil Company
Standard Oil Company (Ohio)
Gulf Refining Company [1]
Mid-Continent Petroleum Corporation
Atlantic Refining Company
The Texas Company
Shell Union Oil Corporation
Socony-Vacuum Corporation
Sinclair Refining Company
Barnsdall Corporation
Cities Service Company
Standard Oil Development Company

The Standard-I. G. Company disposed of the patent rights on the hydrogenation process outside of the United States to the International Hydro Patents Company, a foreign corporation owned jointly by foreign subsidiaries of Standard Oil Company (New Jersey) and the Royal Dutch Shell Group. A companion corporation, International Engineering & Chemical Company, assumed technical and engineering activities for International Hydro Patents Company in the same manner in which Hydro Engineering & Chemical Company assumed the same activities in the United States. The two Engineering Companies are bound to exchange their technical knowledge in the same way as earlier quoted.

The International Hydro Patents Company has entered into an agreement with the Imperial Chemical Industries of Great Britain licensing the latter company to conduct the hydrogenation operation in the British Empire. This license contains provisions for exchange of technical information as exemplified in the contracts earlier quoted.

The hydrogenation process is from a technical standpoint one of the most difficult and involved of all industrial operations. The investment required, even for the simplest laboratory work, is very considerable, and the range of technique, experience and skill required for successful operation covers the widest fields of engineering and chemistry. Investment and operating costs are very high and the process cannot be profitably carried on at present except behind high tariff walls or for the production of especially high-quality, high-priced products. All the parties in it, however, recognize its present technical importance and its potential overwhelming industrial importance, if and when either of two contingencies arises:

(*a*) World level of petroleum prices rises materially, or
(*b*) The continued technical improvements in the process further reduce investment and operating costs.

In the entire world there are only five commercial hydrogenation plants in operation at the present time, as follows:

Merseburg, Germany	350,000 tons per annum.
Ludwigshafen, Germany	Small.
Billingham, England	150,000 tons per annum.
Bayway, New Jersey	5,000 barrels per day.
Baton Rouge, La	5,000 barrels per day.

[1] Have not yet signed license agreements, but will probably do so.

Digitized by Google

Further large plants are under construction at two locations in Germany. A third 5,000 barrel per day plant stands partly completed at Baytown, Texas, and could be wholly completed within six months or less.

The direct financial considerations involved in the agreements referred to above are very large. In addition, all of the parties to these agreements have recognized that they are involved in the common enterprise of endeavoring to improve and perfect a new major industrial development. The agreements for technical cooperation and exchange of information are, therefore, correspondingly broad as well as detailed, and furthermore there has been up to this time complete confidence and the fullest measure of technical cooperation among all of the parties interested.

Very truly yours,

GUY WELLMAN.

GW:AS

APRIL 19, 1935.

Mr. W. C. TEAGLE,
Mr. W. S. FARISH.

DEAR SIR: In further reference to the memorandum covering Mr. Russell's visit with the Army Air Corps people, we have been proceeding with our work on the preparation of high-octane number aviation gasolines by hydrogenation of various stocks. Our conclusion is that we will soon have to be in this business commercially, and we cannot see how it is going to be possible as a practical matter to long withhold the information from the companies associated with us in the hydrogenation pool. Much as we should like to please the Army Air Corps, therefore, we feel that we must explain the situation in detail to them and make it clear that the difficulties in the way of attempting to maintain absolute secrecy concerning methods of production of this material seem to us too great.

Having in mind your interest in this question, we would like to secure your approval before Mr. Russell approaches the Army Air Corps on this matter. Will you please let him have your decision.

Very truly yours,

FRANK A. HOWARD.

SCIENTIFIC AND TECHNICAL MOBILIZATION

THURSDAY, NOVEMBER 4, 1943

UNITED STATES SENATE,
COMMITTEE ON MILITARY AFFAIRS,
SUBCOMMITTEE ON WAR MOBILIZATION,
Washington, D. C.

The subcommittee met at 10:59 a. m., pursuant to adjournment on Thursday, October 21, 1943, in room 104, Senate Office Building, Senator Harley M. Kilgore, West Virginia (chairman of the subcommittee), presiding.

Present: Senator Harley M. Kilgore, West Virginia (chairman).

Also present: Herbert Schimmel, chief investigator; Dr. Robert M. Hunter, Department of Justice.

TESTIMONY OF HON. WENDELL BERGE, ASSISTANT ATTORNEY GENERAL OF THE UNITED STATES

Mr. BERGE. Mr. Chairman, this is the story of the titanium cartel, which is a typical cartel.

The CHAIRMAN. What is titanium, for the benefit of the record? What is it used in?

Mr. BERGE. It is used in paint. I am going to come to that directly. It is a valuable, useful white pigment and, as my story proceeds, we will indicate how it was developed and where it was developed. I believe that it is superior to white lead, but it is that kind of a product. Most people know what white lead is, and I would say generically it is in that field. It is different, and it is an improvement, I believe, from a scientific standpoint.

The CHAIRMAN. It does the work of white lead in a better way?

Dr. SCHIMMEL. That is in the oxide form, of course?

Mr. BERGE. I mean, of course, in the oxide form.

The CHAIRMAN. Go right ahead.

Mr. BERGE. The president of one of the American companies which dominate it was thoughtful or thoughtless enough to define it. He wrote to one of the European officials as follows:

> May I call the proposed combination, for simplicity, a cartel? The whole purpose of the cartel is to obtain a monopoly of patents, so that no one can manufacture it [titanium] excepting the members of the cartel, and so can raise the prices by reason of such monopoly to a point that would give us much more profit on our present tonnage, but also prevent a growth in tonnage that would interfere with their greater profits in lithopone [a competing but inferior product].

It is typical because it has utilized the devices and followed the practices which are found in greater or lesser degree in all cartel

SCIENTIFIC AND TECHNICAL MOBILIZATION

THURSDAY, NOVEMBER 4, 1943

UNITED STATES SENATE,
COMMITTEE ON MILITARY AFFAIRS,
SUBCOMMITTEE ON WAR MOBILIZATION,
Washington, D. C.

The subcommittee met at 10:59 a. m., pursuant to adjournment on Thursday, October 21, 1943, in room 104, Senate Office Building, Senator Harley M. Kilgore, West Virginia (chairman of the subcommittee), presiding.

Present: Senator Harley M. Kilgore, West Virginia (chairman).

Also present: Herbert Schimmel, chief investigator; Dr. Robert M. Hunter, Department of Justice.

TESTIMONY OF HON. WENDELL BERGE, ASSISTANT ATTORNEY GENERAL OF THE UNITED STATES

Mr. BERGE. Mr. Chairman, this is the story of the titanium cartel, which is a typical cartel.

The CHAIRMAN. What is titanium, for the benefit of the record? What is it used in?

Mr. BERGE. It is used in paint. I am going to come to that directly. It is a valuable, useful white pigment and, as my story proceeds, we will indicate how it was developed and where it was developed. I believe that it is superior to white lead, but it is that kind of a product. Most people know what white lead is, and I would say generically it is in that field. It is different, and it is an improvement, I believe, from a scientific standpoint.

The CHAIRMAN. It does the work of white lead in a better way?

Dr. SCHIMMEL. That is in the oxide form, of course?

Mr. BERGE. I mean, of course, in the oxide form.

The CHAIRMAN. Go right ahead.

Mr. BERGE. The president of one of the American companies which dominate it was thoughtful or thoughtless enough to define it. He wrote to one of the European officials as follows:

> May I call the proposed combination, for simplicity, a cartel? The whole purpose of the cartel is to obtain a monopoly of patents, so that no one can manufacture it [titanium] excepting the members of the cartel, and so can raise the prices by reason of such monopoly to a point that would give us much more profit on our present tonnage, but also prevent a growth in tonnage that would interfere with their greater profits in lithopone [a competing but inferior product].

It is typical because it has utilized the devices and followed the practices which are found in greater or lesser degree in all cartel

Digitized by Google

arrangements which the Antitrust Division has investigated. The members of this cartel include I. G. Farbenindustrie, the German chemical trust, and many other foreign companies. The American scene is dominated by three American corporations—the National Lead Co., the du Pont Co., and Titan Co., Inc. These three companies and four of their leading officials were indicted by a grand jury in the Southern District of New York on June 28, 1943. The trial of the indictment has not been held.

The CHAIRMAN. I believe at a previous hearing you told us how many of these agreements affecting the United States I. G. Farben had entered into. Do you remember the number?

Mr. BERGE. I think it was 162.

The CHAIRMAN. Go right ahead.

Mr. BERGE. The case is pertinent to the interests of this committee for several reasons.

(1) Titanium, the most valuable and useful of all white pigments for paints, rubber products, glass, paper, enamel, and other materials, has been priced exorbitantly and its use restricted because of the monopolistic control exercised over it by a world-wide cartel.

Now, when I use the word "exorbitantly," I don't mean in any way to deprecate the product, because we think it is the best in this field; but I use it in the sense of exorbitant in relation to what it well would have been under a competitive situation. I think that the fact that the prices were raised is indicated by the stated purpose of the cartel in the language of one of the officials, which I just read.

The CHAIRMAN. By "exorbitant" you mean the sale price as compared to the cost of production?

Mr. BERGE. Yes.

The CHAIRMAN. You mention rubber. Isn't titanium used to make white sidewall tires?

Mr. BERGE. I believe it is.

The CHAIRMAN. And which tire dealers maintain are stronger sidewalls than black sidewalls.

Mr. BERGE. (2) American members of the cartel are placed in a position where they have felt obliged to help the Japanese evade the British embargo.

(3) American members have seen fit to aid I. G. Farben in attempting to prevent seizure of German-owned patents by the American Alien Property Custodian by the execution of specious patent assignments.

(4) To attain such monopolistic control, the cartel has resorted to flagrant misuse of patents and has gone so far as to actually pay large sums to potential competitors to keep them out of the titanium business.

(5) I. G. Farben, the German chemical trust, as one of the leading parties to the cartel, has dictated the terms upon which American members might do business.

(6) The fact that du Pont, Imperial Chemical Industries, and I. G. Farben are also members of other cartels, such as that involving dyestuffs, makes their control of a fine pigment such as titanium the more objectionable.

Digitized by Google

The CHAIRMAN. Isn't Imperial Chemical Industries the British chemical trust of which the president is Lord McGowan? I believe an article in Life magazine a couple of weeks ago quoted him as saying the Sherman antitrust law would have to be repealed so American and British business could collaborate in the post-war period.

Mr. BERGE. I read the article. I think I have a copy of it here in my brief case. And I was gratified to read that Mr. Eric Johnston assured Lord McGowan that there was little chance of such repeal, and that Mr. Benton, the author of that article in Life, answered Lord McGowan that it was more likely, in view of the activities of the Department of Justice in recent years, that the antitrust law would be strengthened.

The CHAIRMAN. It appears to me that American companies which participate in international cartels usually suffer in comparison with the foreign companies. Ours are independent companies, and they are dealing with foreign companies which are government-controlled and are geared to a common program. Isn't that a real danger to our American economy?

Mr. BERGE. I suppose, if we want to adopt the cartel system in this country as the accepted mode of doing business, we would find it would be good public policy, then, to put them on more of a par in negotiation with foreign cartels through some sort of state sponsorship. But, of course, to my mind, it flies in the face of all that we Americans desire and want in an economic system.

The CHAIRMAN. I am in hearty agreement with you on that.

Dr. SCHIMMEL. Isn't it true that this marriage of the German Government and cartels was actually the basis for the war which we have today?

Mr. BERGE. I certainly think it was one of the major factors.

The CHAIRMAN. Go ahead.

Mr. BERGE. It is difficult to think of any material which is more universally used by private citizens and by governments alike than is paint. In time of peace the United States Government buys and uses enormous quantities of paint. In this time of war its purchases account for by far the greater portion of all the paint manufactured in the entire country.

It is a fact which is not widely known that the finest of all white pigments, useful in colored paints as well as white, is titanium dioxide. It is also not generally known that titanium is the ninth most abundant element in the earth. Crude titanium is found in combination with iron in an ore called ilmenite in many places in this and other countries.

Dr. SCHIMMEL. Where is it found in this country?

Mr. BERGE. I know there is a large deposit in New York State which is being worked, and there are deposits in many other places where the concentration of titanium is not great enough to make production possible as yet. I understand there is a large sand beach in Florida, owned by National Lead, which has considerable concentration of titanium. One of the deposits that is the purest in the world, or where it is found in a very pure form, is in the sands of a beach in India, Travancore Beach, and in lesser concentration in other places.

Digitized by Google

While the element itself is abundant, no commercially practical processes for reducing it to pigment form were known until about the time of the First World War. In the relatively short period which has passed since then technology has been developed which makes possible the manufacture of the finest pigment from titanium. It has already displaced white lead, lithopone, and other pigments in a large share of the market. In hiding power—covering qualities—opacity and chemical inertness, all essential qualities for paints, titanium compounds, chiefly titanium dioxide, excel all other kinds of pigments.

Shortly after the Civil War it was discovered that titanium ore could be reduced to a powder which when mixed with oil resulted in a paint. It was not until about the beginning of World War No. I that a feasible method of separating titanium oxide from the ore was worked out. This was accomplished by two chemists, Dr. A. J. Rossi and L. E. Barton, whose research was done for the Titanium Alloy Manufacturing Co., organized by Dr. Rossi and others in 1906. As a result of their discovery, a new corporation called the Titanium Pigment Co. was formed in 1916. At that time, as well as subsequently, the leading manufacturer of white pigment was the National Lead Co. Recognizing the implications of titanium's excellence in this field, National Lead purchased a substantial interest in the Titanium Pigment Co. in 1920. The two companies continued to operate more or less separately until 1932, when National Lead acquired the entire stock of Titanium Pigment. In 1936 the Titanium Pigment was dissolved as a corporation and its business and properties were taken over and operated as a division of National Lead.

The CHAIRMAN. Is National Lead a large company?

Mr. BERGE. Yes; its assets exceed $100,000,000, and it is the largest manufacturer of titanium pigments.

The CHAIRMAN. Rossi and Barton, who first did this work, were American research people?

Mr. BERGE. Yes.

The CHAIRMAN. And it really is an American development?

Mr. BERGE. Oh, yes. I am going to show later, in just a moment, that working independently of these Americans, similar processes were hit upon by foreign scientists about the same time or a little later, but the development in this country was the result of the work of Rossi and Barton, and they formed this Titanium Alloy Co., and later National Lead, through acquisition, succeeded to it.

During substantially the same period in which this development was taking place in this country, a different process for the manufacture of titanium compounds was being developed in Norway by Gustav Jebsen. His process was patented and was exploited by a Norwegian corporation called Titan Co. A/S. At about the same time a Russian chemist named Joseph Blumenfeld was perfecting, in France, another method of manufacture, which was likewise patented. Thus, prior to 1920 three groups working independently of one another had developed processes for utilizing titanium ore for production of pigments. These groups are:

1. Titanium Pigment Co., subsequently absorbed by National Lead Co.

Digitized by Google

2. Titan Co. A/S. originally organized in Norway by Jebsen for the exploitation of his developments. Eighty-seven percent of Titan Co.'s stock was purchased by National Lead in 1927, the remaining 13 percent being retained by Jebsen. This company was originally intended to exploit the foreign interests of National Lead, but in 1929 National Lead and Jebsen organized in Delaware a holding company called Titan Co., Inc., the sole function of which was to hold all foreign interests of the parties. The Norwegian company remained in existence in Norway solely as the sales agent for Titan Co., Inc.

3. The Blumenfeld interests in France. Whereas National Lead and Jebsen chose to exploit their patents by means of operating companies, Blumenfeld followed a general policy of licensing other interests.

Now we will take up the main agreement of 1920 between Titanium Pigment Co. (now part of National Lead) and the Norwegian Titan Co. This is an important agreement in this picture.

Titanium Pigment and Titan Co. in Norway entered into a contract dated July 30, 1920, which is the foundation upon which the parties and their successor companies have been able to build a cartel with monopoly ramifications extending throughout the world. This contract was to extend to 1936 and was to be automatically renewed for 10-year periods unless terminated by 5-year notice.

The CHAIRMAN. Was such notice given in '41?

Mr. BERGE. I understand not.

By the terms of this agreement, National Lead (as Titanium Pigment and its successor in interest will now be called)—Whenever we speak, now, of National Lead—they took over, I believe, in 1927, but it is difficult to differentiate all the time as I go along—I will refer to it, hereafter, as National Lead. National Lead was assigned the markets of North America as its exclusive territory. Titan Co. A/S was given the rest of the world with the exception of South America, which was to be common territory. The two companies granted each other exclusive licenses under their patents for their respective territories, excluding even the licensor from the licensee's territory. Each agreed not to ship into the other's territory and to prevent its licensees from shipping their finished products into the other's territory if it would interfere with the other party's sales. Any sublicensee was required to be governed by the same restrictions as the parties imposed upon themselves.

The parties agreed to exchange know-how and also to permit visits of representatives to their respective plants. Each party undertook to secure from its employees assignment of any and all inventions developed by them. In acquiring rights to inventions from third parties, each agreed to secure rights for all countries within the territory of the other party.

The CHAIRMAN. Have you ever found any company which didn't require its employees to assign all their inventions to it?

Mr. BERGE. I think it is the universal practice to have such requirement.

The CHAIRMAN. The reason I ask that question is that there has been considerable controversy that the Government, procuring patents

Digitized by Google

from its employees and people under contract to it, would be doing grave injustice and would be putting a strait jacket on inventive genius and would be robbing these men of their rights. Would they be as near robbery under the bill as the system now practiced?

Mr. BERGE. I am sure not. In fact, at present, the man becomes a salaried employee, and a salaried employee assigns anything he may invent to the corporation. Of course, it is patented in his name.

The CHAIRMAN. Because the corporation, under our laws, cannot patent it.

Mr. BERGE. That is right. Only individuals can patent.

And I think it is also true that, generally speaking, in laboratories, private corporations, the work a man shall do is to a considerable extent assigned to him. Of course, there may be various degrees of liberty allowed in pursuing—allowed to the employee—independent research on his own, but generally speaking, I think they block it off and assign their men to particular projects.

To illustrate, it is like hunting for a needle in a haystack; if one man, operating independently on the old-time basis of the inventor who works in his own shop or his own basement really finds something, we find the needle in the haystack; you have really done something notable.

But if you block off the stack into cubic feet and you have men, each canvassing a particular foot of hay, I suppose the man who finds the needle is not entitled to any particular credit more than the ones who do not find it. He happened to get the cubic foot that had the needle in it.

The CHAIRMAN. But the statement of Doctor Egloff and others would lead the public, however, to believe that independent research is still carried on in all private laboratories, and every man does as he pleases.

Mr. BERGE. I am confident that is not so.

The CHAIRMAN. In fact, it wouldn't be good business to do it that way.

Mr. BERGE. No.

Following the execution of the 1920 agreement, the parties operated under it until 1927.

Jebsen, having Europe as part of his territory, set up a selling company in France. This was originally intended to become a manufacturing company also, but this idea was never carried out. National Lead acquired a majority interest in this company in 1927. At the same time it acquired 87 percent interest in Titan Co., the Norwegian company, Jebsen retaining the remaining 13 percent.

Also in 1927 National Lead and Jebsen formed a new company in Germany in conjunction with I. G. Farben. This company, Titangesellschaft, was organized as part of a series of transactions including the execution of nine separate contracts. Titangesellschaft was given as its exclusive territory for manufacture and sale of titanium compounds the following countries: Germany, Russia, Austria, Hungary, Czechoslovakia, Switzerland, Rumania, Serbia, Jugoslavia, Bulgaria, Greece, Turkey, Japan, China, and Spain. In 1933 Titangesellschaft eliminated potential competition on the part of the Sachtleben Co.

Digitized by Google

in Germany by the simple expedient of paying it a large sum of money for its agreement to stay out of the titanium business.

In 1929, National Lead and Jebsen organized in Delaware a company called Titan Co., Inc., for the purpose of holding their foreign interests. Titan Co., Inc., succeeded to the position of the Norwegian Titan Co., under the basic agreement of 1920. Thus, we have National Lead as successor to Titanium Pigment as one party to the basic agreement and Titan Co., Inc., owned 87 percent by National Lead, as the other party. However, the 1920 agreement continues in existence, inasmuch as its territorial and license exchange restrictions form the basis and pattern for all the subsequent agreements. Thus, Titan Co., Inc., became entitled to all territory outside North America except as yielded up by the German agreements and others subsequent to them

The CHAIRMAN. As a result of these transactions, did the I. G. Farben Co. obtain exclusive use in the countries you have listed of the patents of Rossi and Barton, for which research had been done in the United States for the Titanium Alloy Manufacturing Co.?

Dr. HUNTER. In the territory in which they operated; yes.

Mr. BERGE. Blumenfeld transferred all his patent rights to a French company known as Societe de Products Chemiques des Terres Rares. This company then licensed or sold them to different companies operating in various European countries, the British Empire, and United States.

In the United States, the patents were first owned by the Commercial Pigments Corporation, which sold them in 1931 to the Krebs Pigment and Color Corporation. At that time, du Pont owned 70 percent of the stock of Krebs. It subsequently acquired 100 percent and now operates it as the Krebs division of du Pont.

So we find the Blumenfeld interests getting into the United States through du Pont.

The CHAIRMAN. In other words, when they first found competition growing up abroad.

Mr. BERGE. National Lead entered upon negotiations with du Pont, looking toward an agreement which would allow the two companies to maintain a monopoly of the titanium business in this country and eliminate competition between them. I. G. Farben insisted that in any such agreement, du Pont must obligate itself not to compete or allow its sublicensees to compete in I. G. Farben's territory: i. e., the world outside the Western Hemisphere.

So there you have the Blumenfeld patents coming into this country through du Pont; National Lead, which has its hookup with Farben, and du Pont, getting together; but in ironing out their arrangements, Farben insisting that its exclusive rights be protected against competition from the du Pont licensees.

The CHAIRMAN. Would this be a fair way to state it—that that follows the usual pattern of I. G. Farben cartels, in which they allow us to exploit ourselves and our South American neighbors, retaining to themselves the right to exploit the rest of the world.

Dr. HUNTER. And also to get in the South American market.

The CHAIRMAN. In competition.

Digitized by Google

Dr. HUNTER. Or divide it up.

Mr. BERGE. When a proposed form of agreement was submitted to I. G. Farben for approval, it objected because the license given by du Pont for foreign territory was a "nonexclusive license." A National Lead official reassured I. G. Farben on this score in the following language, which is quoted from his letter written in 1933, and I quote:

> In regard to the phrase "nonexclusive license" to which you call our attention * * * we have to refer to the United States antitrust laws which absolutely forbid the granting of exclusive licenses between two manufacturers in the United States as such a practice would tend to create a monopoly. Therefore, the use of this phrase "nonexclusive license" is simply to comply with the United States laws and in practice the licenses under each other's patents will undoubtedly prove to be, to all intents and purposes, exclusive.

The CHAIRMAN. Did they prove to be exclusive?

Mr. BERGE. Yes; they did.

The CHAIRMAN. How was this type of arrangement regarded by your department?

Mr. BERGE. I think the answer to that, Senator, is, that in June of this year we indicted the companies involved.

The CHAIRMAN. In other words, they said that their contract should conform, but their performance should not conform to the antitrust laws.

Mr. BERGE. That is right. In my statement, I said we indicted the participants. That must be modified, because we didn't have jurisdiction over all of them. We had jurisdiction over National Lead and the American companies and indicted them.

Dr. SCHIMMEL. Can't you indict Imperial Chemicals and I. G. Farben?

Mr. BERGE. You have to have something to tie to. You can name foreign companies as coconspirators, and you can indict a foreign company when it is present and doing business in this country, or sue them in equity, as in our aluminum case. We have the Aluminum of Canada today as defendant, and there was a battle over whether they did business in this country or not, and it was determined they did.

The CHAIRMAN. And if they are not doing business here, you cannot indict them, because they are not citizens and are not doing business here.

Mr. BERGE. That is right.

I. G. Farben's objections having been met and other difficulties overcome, Titanium Pigments Co., Inc., and Krebs Pigment and Color Corporation, subsidiaries of National Lead and du Pont, respectively, entered into an agreement dated January 1, 1933.

Now, you have an agreement between the operating companies.

It provided for a mutual grant of irrevocable and "nonexclusive rights" and a license within the United States to use all processes, methods, and apparatus of manufacture, including present and future processes and patents. It also provided that each party might sell the products resulting from the exercise of the processes in the United States, Central, and South America. The territorial division of the basic agreement of 1920 was thus preserved.

The CHAIRMAN. In what way did the National Lead and du Pont Co. cut down competition between one another inside the United States?

Digitized by Google

Mr. BERGE. Certainly there was no competition in price. Could you supply anything further, Dr. Hunter, as an answer to that?

Dr. HUNTER. I have the impression there was a very considerable division of markets, respecting each others' markets here, and they worked very closely in cooperation.

The CHAIRMAN. And the use of the word "nonexclusive" in that contract was also with the tongue in the cheek, with a quiet agreement to be exclusive although agreeing to be nonexclusive.

Dr. HUNTER. Seemingly, from the quote that was just read.

Mr. BERGE. The agreement also provided for the exchange of the most detailed information with respect to technical developments and know-how "to the end that all the knowledge and experience of each party in the licensed field shall be at the full disposal of the other." This provision caused some little difficulty between the parties. About 1937 I. G. Farben developed a new titanium pigment (rutile) of exceptionally fine quality which gave a great competitive advantage. It passed the information concerning it to National Lead.

And, of course, under the arrangements that would be available to National Lead. And the information was passed on to National Lead by Farben.

But National Lead failed to inform du Pont of this development, and when du Pont later discovered that such had been the case, it charged National Lead with violation of its agreement. The net result was an amendment in 1941 of their agreement with the elimination of the exchange-of-information provision. Actually, du Pont itself developed a similar rutile pigment and started production of it while National Lead was still guarding the secret it had received from I. G. Farben without producing the pigment.

The CHAIRMAN. Is the conclusion correct that the members of the cartel not only tried to keep information about the scientific progress in pigment from companies outside the cartel, but sometimes even from members in the cartel?

Mr. BERGE. Yes; this instance shows that.

The CHAIRMAN. Please go on.

Mr. BERGE. The 1933 agreement further provided that each party was to pay a royalty to the other on the basis of titanium dioxide produced and packed by it. Du Pont was to pay National Lead a royalty of 2½ percent based on the average published carload price, and National was to pay Krebs (du Pont) 1 percent on a similar basis. It was provided, however, that in no event was royalty to either party to exceed $10,000 in any given year, and all royalties were to cease as of December 31, 1936.

The parties undertook to use their best efforts to acquire the rights for each other from third parties and du Pont further agreed to offer licenses to the foreign associates of National Lead for the various countries of the world. This virtually was a commitment by du Pont to give National Lead's foreign subsidiaries a preference in granting licenses.

Following the execution of the du Pont-National Lead agreement in 1933, du Pont entered into a series of four contracts with Titan Co., Inc. By these agreements, du Pont agreed to turn over all its foreign patents to the various foreign associates of Titan Co., Inc. The result was a virtual consolidation of all the important titanium interests

Digitized by Google

throughout the world. All commercially useful patents were under the control of the parties involved. Future control was assured by the various provisions of the agreements requiring the continuing exchange of licenses and patents to the practical exclusion of all would-be competitors.

At the time of the formation of the Titangesellschaft, it was the intention of the National Lead-I. G. groups to extend their facilities into any country, if and when it seemed necessary. From time to time beginning in 1933 the National-Titan-I. G. group because of threatened competition in one country after another, was forced to take action to control the various competitive forces. This happened in Great Britain, Canada, and Japan.

As early as 1930 the British Chemical Trust, Imperial Chemical Industries, Ltd., evidenced a desire to engage in the titanium business and in fact carried on considerable research work in that connection. This came to the attention of the National Lead-Titan group and prompted them to take action to control the development in the British Empire. At that time, the Blumenfield British patents were owned by National Titanium Pigments Co., Ltd. It was feared by the National Lead-Titan group that National Titanium Pigments, I. C. I., and Imperial Smelting Corporation would undertake a joint enterprise and thus offer formidable competition in that territory.

The thought I had in mind there was that about the same time that the necessity developed for du Pont and National Lead to get together in this country, it can be seen here that the National Lead group was concerned that I. C. I. and these other British companies would exploit the Blumenfeld process in Britain and get ahead of them. So it appears they were taking similar steps in Britain, just about the time they were taking them in this country, to prevent the Blumenfeld development from furnishing real competition.

After considerable negotiation, a jointly owned corporation, British Titan Products, Ltd., was formed. The stock was owned 49 percent by Titan Co., Inc., and 51 percent by I. C. I., Imperial Smelting and Goodlass Wall Lead Industries, Ltd., in equal shares.

That is, you have these three British companies owning 51 percent and Titan Co., 49 percent, in this new company, which was called British Titan Products, Ltd.

In conjunction with the formation of the new corporation, the participating companies executed a series of agreements, the purpose and result of which was to divide territory and avoid competition among the various companies. The principal contract between Titan Co., Inc., and British Titan Products was to extend to 1963 and to continue in force thereafter until canceled by either party upon 12 months' notice. It is still in effect. The Blumenfeld patents had been acquired by the British Laporte Co., and negotiations between Laporte and British Titan Products were carried on in 1940 and 1941. In August 1941 an agreement in principle was arrived at. This provided that Laporte was to receive 20 percent of the British market for the duration of the war. British Titan Products tried to make it for a longer period and stated its willingness to concede a larger proportion of the market, but Laporte refused.

Jebsen now, as an officer of a National Lead subsidiary, gave his approval to this agreement and stated that he was quite satisfied that it

Digitized by Google

was only for the duration, because he felt that British Titan Products would be much better off after the war as a result of the developments which they would get from National Lead. He felt that they could use these developments to advantage in dealing with Laporte in post-war negotiations.

Now we come to Canada: The most important chemical company in Canada is Canadian Industries, Ltd. (C. I. L.), most of the stock of which is owned by du Pont and I. C. I. Under the basic agreement of 1920, Canada was within the territory assigned to National Lead and it supplied most of the Canadian market until the early thirties, when British Titan Products was allowed to ship into Canada on a preferential basis. The British Laporte Co. was also shipping into the Canadian market. Although it held the Canadian Blumenfeld patents, it did not undertake to manufacture in that country. Du Pont also was exporting to Canadian buyers, and for a number of years the various companies participated in price-stabilizing agreements.

In 1937 National Lead and C. I. L. organized Canadian Titanium Pigments, Ltd. (51 percent C. I. L., 49 percent National Lead) for the manufacture and sale of titanium in the Canadian market. At the same time, they purchased the Blumenfeld Canadian patents from Laporte. A series of contracts executed by National Lead, C. I. L., and Canadian Titanium Pigments contain the usual provisions for division of territory, licensing of patents, control of shipment of manufactured products, exchange of know-how, and so forth. The principal contract extends until 1967. National Lead continues to sell Canadian Titanium Pigments all its requirements for the Canadian market. However, it is obligated to cease all exports to Canada as soon as Canadian Titanium Pigments builds a factory which is scheduled for erection immediately after the war.

The only remaining country of any commercial consequence was Japan. By virtue of the European cartel agreements, the Japanese market had been assigned to the Titangesellschaft and to the Blumenfeld French company in the ratio of 70–30. The Titan Co., Inc., owning 50 percent of Titangesellschaft, profited by this arrangement. From the time of the execution of these agreements until 1937, the Japanese market was supplied with products manufactured in Germany. From time to time, however, there were indications of independent competition, which finally become so threatening to their control that the National Lead-I. G. Farben interests thought it necessary to undertake development of a domestic manufacturing plant in Japan.

The CHAIRMAN. The German work through Titangesellschaft was being shared, to a large extent, by National Lead and I. G. Farben?

Mr. BERGE. Yes; that is right.

After considerable negotiation and the overcoming of many difficulties, the various interested companies executed a series of seven contracts providing for the formation of a new company known as Titan Kogyo Kobushiki Kaisha. The participating companies were National Lead and I. G. Farben, operating through their jointly-owned subsidiary Titangesellschaft, Blumenfeld's French company, and a Japanese chemical company, the Kokusan Kogyo Kabushiki Kaisha. Neither National Lead nor Blumenfeld had any direct contact with the operations of the Japanase company, inasmuch as all matters were

Digitized by Google

handled through I. G. Farben by its Japanese representative, Doitsu Senryo Gomei Kaisha. By virtue of the executed contracts, Kokusan was given 50 percent of the stock of Titan Kogyo. Titan Co., Inc. (representing National Lead's interests), received 17½ percent; I. G. Farben, 17½ percent; and Blumenfeld's French company, Terres Rares, 15 percent. Because of restrictions of the German Government, I. G. Farben was unable to supply capital necessary to subscribe for its share of the stock. Consequently, Titan Co., Inc., subscribed for I. G. Farben's share and gave the latter an option to purchase these shares at any subsequent time.

The CHAIRMAN. Now, would it be correct to conclude from this testimony that the American group in the cartel financed I. G.'s participation in the Japanese company, and that I. G. Farben represented it in all negotiations and operations in Japan?

Mr. BERGE. Yes; I think that would be a correct statement, in effect, of what happened.

The CHAIRMAN. In other words, the American money went in to buy an interest for the German company, to be paid for later when currency restrictions of Hitler should be relieved.

Mr. BERGE. Yes.

Dr. SCHIMMEL. In other words, we put up the money, but the policy in actual day-to-day negotiations was determined by the Germans.

Mr. BERGE. That is right.

The CHAIRMAN. Yes.

Mr. BERGE. Because of German participation in the Japanese Titanium Co., the British Government refused to permit titanium from Travancore, India, to be exported to Japan in the fall and winter of 1940–41. Titanium was badly needed in Japan and the Japanese Government had not permitted any titanium pigments to be exported for a long time. Knowing this, and in spite of the fact that the situation in this country was very serious because of disruption of shipping and inadequacy of domestic supplies, nevertheless Titanium Pigment—National Lead—shipped 700 tons to Titan Kogyo Kaisha, Ltd., on March 9, 1941, thus aiding the Japanese to evade the embargo which the British had with good cause placed on sale to Japan. In a letter dated April 3, 1941, the manager of Titanium Pigments wrote to the Japanese company—I quote:

> Even at the time we made shipment to you of 700 tons on March 9 the situation was so serious that we should have much preferred not to have released even this quantity, but in view of the fact that we had promised it to you early last fall, we felt that we should not withdraw our offer. Incidentally at the time we made this shipment to you in March the replacement value of that ore was more than double the price at which we invoiced it to you.

The CHAIRMAN. In other words, we were double-crossing the British there and just prior to Pearl Harbor we were still shipping these paints for the painting of Japanese ships, and so forth, to Japan, and shipping it at a greatly reduced price.

Mr. BERGE. I think that is so.

The CHAIRMAN. When we were really short of both shipping and pigments, too.

Mr. BERGE. I think there has never been an adequate supply of titanium in this country during the war years to meet the demands of Government and private industry.

Digitized by Google

The CHAIRMAN. Of our own defense program?

Mr. BERGE. Yes.

The CHAIRMAN. And we were right in the middle of our defense program at that time.

Mr. BERGE. Yes; the early part of '41.

Dr. HUNTER. Senator, only a few things were put into this summary. There is a very interesting incident. A few months previous to this, the Japanese had tried to import from Travancore, India, a shipment of two or three thousand tons of ore, and ran into this difficulty of the British embargo, and the documents in our files show that the Japanese appealed to I. G. Farben to appeal to Jebsen, the Norwegian, to appeal to the National Lead to intercede with the British Government to permit that shipment of ore to be made, and that such intercession was made and a shipment was obtained through the intercession of I. C. I.'s agent in Japan. They actually got the shipment, in spite of the previous British embargo.

Dr. SCHIMMEL. Where did this 700 tons of ore come from?

Dr. HUNTER. That was Norwegian ore, in a stock pile in this country, and shipped from here to Japan.

Dr. SCHIMMEL. So they didn't get Travancore ore, but they got the pigment.

Dr. HUNTER. That is right.

Mr. BERGE. The extent to which one member of a cartel will go in protecting the interests of a foreign partner and, incidentally, in attempting to safeguard its own monopoly position, is indicated by the following letter and resolution. The letter, dated December 11, 1939, is from the manager of National Lead's patent department to the general manager of the titanium division:

Confirming our recent conversations, regarding exchange of title to patents, I beg to review the situation for you.

On September 7 I wrote Dr. Jebsen, pointing out that in view of the war certain questions arose affecting the United States patents which stand in the name of Titangesellschaft and the I. G. Farbenindustrie under which we enjoy an exclusive license. We suggested to Dr. Jebsen that it might be desirable to assign to National Lead Co., in trust, the patents of the I. G. Farbenindustrie and Titangesellschaft against the possibility of the United States entering the war and taking over these patents. *The suggestion was primarily designed to protect the patent property of the I. G. Farbenindustrie and Titangesellschaft and at the same time would have protected our exclusive license by insuring that no one else could have petitioned the government to secure licenses under them.* On December 7 I received the following cable from Dr. Jebsen:

"Your letter September 7. Subject leadcos and titanines approval *have agreed assignment* T. G. patents and applications countries outside TG territory to titanine and assignment leadcos and titanines patents and applications countries within TG terirtory to TG. Assignment patents British Empire, France must be postponed due war situation. Patents and applications of I. G. cannot be included presently but question will be studied. Please cable approval. German patents 571387 and 588230 and 604311 are in leadcos Czechoslovakian patent 39354 in Titanium Pigment Co., Incorporated's name. All other patents TG territory in Titanines name. Cable Titanine board's authorization. I assign Titanines patents and applications to T. G. as above outlined. Suggest formal resolution be made general regarding assignment and mailed. Please acknowledge cable upon receipt—Jebsen."

Of course, this cablegram, which wasn't any too clear because of the code words, was really giving directions for the assignment to the German company of the American patents, and then they wanted the formal authorization wired them and so forth.

Digitized by Google

The suggestion here is that Titangesellschaft will assign their United States patents and applications to National Lead Co. and National Lead Co. and Titan Co., Inc., will assign their applications and patents in Germany, and other countries within Titangesellschaft's territory to Titangesellschaft.

For purposes of considering this suggestion, National Lead Co.'s title may be disregarded. Several years ago National Lead Co. formally renounced maintenance of any European patents owned by it, putting upon Titan Co., Inc., the obligation to pay all maintenance charges and hence, under the agreement of 1920, Titan Co., Inc., could have requested formal assignment of these patents. They have not done so, in order to save the expense of preparing the assignments, and recording them in the various countries. The question is therefore, whether Titan Co., Inc., should assign its patents and applications to Titangesellschaft.

In discussing this matter with you on December 8, *it appeared to us that to assign these patents in Germany to Titangesellschaft might involve some risks for the future. For instance, if the Germans owned all the patents now held in Germany by Titan Co., Inc., and if, as a result of the war, they were forced by their government*, or through other circumstances, *to abrogate the main agreement, they would be free to export their products and, in general, take themselves outside of the titanium family cooperation.* I cabled this thought to Dr. Jebson, soliciting his views. A reply has just been received, which reads as follows:

I guess what that really comes to is they were afraid if they assigned these patents, they might not get them back; the arrangement might be broken after the war.

"Proposal my cable December 7 is not T. G.'s but mine. Consider this best present circumstances to secure legal position all around. Exactly legal post-war position patents otherwise very uncertain. *Prevention import partly secured in future by patents in respective countries but will be chiefly secured by all companies selfish interest in cooperation because of advantages already realized by experience.*"

In other words, "You can trust us because it's in the best interest of all of us to continue this arrangement after the war."

You will see that Dr. Jebsen believes that in view of the war the best possible legal position for each member of the family is to hold title to all patents in its territory. He believes that prevention of import and export competition will chiefly be secured in the future through the individual company's recognition of the advantages to be derived from maintaining the cooperation, having through experience appreciated the value of this cooperation.

It should be noted in this connection that even if Titan Co., Inc., retained title to the patents in Germany, and should the government force abrogation of the main agreements, particularly with a view of fostering German exports, they will find means to negate Titan Co., Inc.'s patent rights also. *Should the situation develop where Titangesellschaft is forced, perhaps against its will, to engage in export competition with other members of the titanium family, then, as pointed out by Dr. Jebsen, that competition can be controlled by patents owned by the other members of the family in their particular territories.* Therefore, I believe we should approve Dr. Jebsen's proposal. [Italics supplied.]

That this plan was put into effect is shown by a resolution adopted by the board of directors of Titan Co., Inc., December 19, 1939:

On motion duly made and seconded, the following resolution was unanimously adopted:

Resolved, In furtherance of that certain license agreement between Titan Co. A/S (predecessor in interest of this corporation) and Titangesellschaft m. b. H., of Leverkusen, Germany, dated October 3/20, 1937, and pursuant to the recommendation of Dr. G. Jebsen, vice president of this corporation, the officers of this corporation be and they hereby are authorized and empowered to execute and deliver in its name and behalf appropriate assignments to said Titangesellschaft of all patents and patent applications of this corporation, within the licensed field as defined in said agreement, in countries now embraced within the territory of said Titangesellschaft as defined in said agreement and subsequent amendments thereto, in consideration of the execution and delivery by said Titan-

Digitized by Google

gesellschaft to this corporation of appropriate assignments of all patents and patent applications of said Titangesellschaft, within said licensed field, in countries embraced within the territory of this corporation as defined in said agreement and subsequent amendments thereto, and upon the express understanding and condition that such reciprocal assignments shall in no way alter or limit the general intent and operating effect of said agreement of the several other rights and obligations of the respective parties thereto.

There being no further business the meeting then adjourned.

Among the patents so assigned to avoid seizure by the Alien Property Custodian is one covering the new rutile pigment previously mentioned. I trust that the full implications of these quotations are sufficiently clear that no further explanation is necessary. This committee has been told of the Dusseldorf conference in 1939, at which German and British business leaders planned the type of cartel economy which would protect them against the rigors of competition.

In the cable which has just been read, and the action taken pursuit to it, you have an example of post-war planning which has been all too prevalent in these cartel groups. This is not the only instance in which a German company's United States patents have been taken over by an American cartel partner to avoid seizure by the Alien Property Custodian.

The CHAIRMAN. In other words, this amounts, really, to a proposal, in full anticipation of war, that American companies protect German interests against the effects of that war.

Mr. BERGE. That is right. And specifically to forestall seizure of the patents by the Alien Property Custodian in the event of war.

Dr. HUNTER. Here is something that was not summarized here. I would like to read it. This is a letter from this same writer to Dr. Jebsen, dated January 15, 1942, which was about 5 weeks after Pearl Harbor, and after we were actually at war with Germany. It referred to certain Canadian patent applications, and these sentences occur:

While technically speaking, to furnish C. T. P. copy of the specification in case T. 236 might be a violation of the understanding not to transmit technical information from one belligerent to another, it might be justified in view of the following considerations: We could not give the Canadian application as careful consideration as could our Canadian associates.

In this sense, they are actually protecting the property rights of the I. G. in this application. Furthermore, they are entitled to an exclusive license under the application, and are prepared to assume all the expense of the prosecution, paying the same directly to Fetherstonaugh & Co. of Ottawa.

The sentence I had in mind particularly is this:

In this sense, they are actually protecting the property rights of I. G. in this application.

That was after the United States and Canada were both at war with Germany.

Dr. SCHIMMEL. So they thought the cartel with Germany was in real force, and they had to make believe it was in the interest of I. G. to go through with this arrangement.

The CHAIRMAN. The whole idea of it being to negate our force as far as the Government was concerned in dealing with the enemy.

Who was the author of the letter?

Dr. HUNTER. Kaegebehn.

Dr. SCHIMMEL. You people are going to put into this hearing a more complete set of documents?

Digitized by Google

Mr. BERGE. We can do that if the committee likes. This originally was written up in about an 85-page memorandum, and it was pretty long and involved, and I asked that it be reduced to a manageable length for my statement today. We can furnish the committee the more detailed memorandum and leave to your judgment whether it should be printed. My statement is repetitious of the longer memorandum, but it is more condensed here. There are further details in the memo, and I see no reason why we should not turn it over to the committee.

The CHAIRMAN. Let us have the long memo to study at leisure.

Mr. BERGE. The plan he recommended and discussed in this letter and about which they exchanged cables was put into effect.

The CHAIRMAN. Has anything been done to make these patents available to the public?

Mr. BERGE. Of course, we have indicted the American participants in this whole illegal scheme, and we would hope and expect that the outcome of this litigation will be to make them available.

The CHAIRMAN. All right.

Mr. BERGE. The program is to continue in the post-war economy these arrangements which temporarily, because of the rigors of war, they had to abstain from, and they make this temporary truce agreement to handle the thing during the war.

The CHAIRMAN. Wasn't the Hague memorandum entered into between Standard Oil of New Jersey and I. G. Farben a similar transaction of Standard Oil protecting I. G. Farben's interest in hydrogenation and rubber and various other things?

Mr. BERGE. That is right.

The CHAIRMAN. Which made it so hard for us to produce rubber at the outbreak of the war.

Mr. BERGE. I think there were some 2,000 patents handed over in that transaction to keep them from being seized by the Alien Property Custodian.

Dr. HUNTER. The Alien Property Custodian has vested himself with interest in all I. G. Farben's patents.

Mr. BERGE. In regard to all commodities.

Dr. HUNTER. A very broad, blanket vesting, and it is being threshed out now as to just what I. G. Farben's interest is in these things.

Dr. SCHIMMEL. Are you talking about titanium now?

Dr. HUNTER. No; just Standard Oil.

The CHAIRMAN. That consent decree does not disturb any rights the Alien Property Custodian has in those patents. So those rights still prevail.

Dr. HUNTER. That's right.

Dr. SCHIMMEL. What about the titanium patents? Have they ever been seized?

Dr. HUNTER. I couldn't speak for either the Alien Property Custodian or his counsel, but I don't know of their having been seized.

Mr. BERGE. The understanding that such assignments are involved in the transaction I have just outlined shall only operate during the war, and that after the war the game shall take up where it was left off——

The CHAIRMAN (interposing). As a matter of actual fact, that has been taken up several times by foreign industrialists even during the war, has it not?

Digitized by Google

Mr. BERGE. I think undoubtedly they are thinking about it, talking about it, planning for it, probably both in this country and other countries.

The CHAIRMAN. Do you have any evidence on what type of post-war arrangement they envisage being worked out? Isn't that one of the bases of attacks on the Sherman Act?

Mr. BERGE. I think that's so. Referring again to this story in Life by Benton, I think that makes it quite clear the amount of concern and interest that the British industrialists are expressing in the post-war problem. Lord McGowan's reference to the Sherman Act, Eric Johnston's forthright discussion of the problem in one of the speeches that he made over there, that was printed as an article in the Reader's Digest recently, and the various discussions going on right in this country in trade and industrial groups, where obviously they want to preserve in general this system but are bothered, I guess, as to whether we are going to let them do it——

The CHAIRMAN (interposing). And really hasn't the operation of this, shall we call it, self-exploitation system, by which we exploit our own people, been largely responsible for the high dollar cost of living?

Mr. BERGE. I think so.

The CHAIRMAN. Thereby bringing about the very thing the industrialists complain of, which, they say, is excessively high wages, which, of course, must be based on living cost—high dollar cost of wages.

Dr. SCHIMMEL. Don't you think, for the purpose of completing the record, it would be helpful if we could get the exact status of these patents which were transferred from Germany?

The CHAIRMAN. I think the proper thing to do is to address a letter to the Alien Property Custodian. Could you furnish to the committee, Mr. Berge, enough information that we could address to the Alien Property Custodian an inquiry as to whether or not the patents have actually been taken into custody?

Mr. BERGE. We can do that.

In a system of free enterprise the product which will best do the work and which can be produced and sold at the lowest price will take the place of competing products which are inferior in quality or higher in price though equal in quality. Our whole competitive economy is predicated upon this rule. To the extent which monopoly and artificial restraints are allowed to enter the picture to that extent is the rule set aside. Inferior or more expensive products are allowed to hold a share of the market which they would lose on a competitive basis.

This is well illustrated in the case of titanium pigment and an inferior product called lithopone. The latter is a pigment in the manufacture and marketing of which du Pont has taken a leading part for many years. Since 1933 National Lead and du Pont have maintained identical prices for titanium compounds. There have been changes in market prices on the average of twice a year on all grades of pigments and in every instance the effective date of price change of each party has been the same. With respect to lithopone, which is competitive with the calcium sulfate composite pigment, there has been maintained a constant differential. Unless the lithopone were priced below the titanium compound, it could not sell. Therefore, irrespective of costs of production, the titanium compound has been

Digitized by Google

priced 2 cents a pound above the price of lithopone. An honest technologist who knows that a better product can be made at a profit to undersell an inferior competing product cannot be expected to be happy in a situation which holds back the better and aids the poorer.

In other words, this price differential was maintained, as we see it, in order to keep a market for lithopone, whereas in a truly competitive situation it might well have replaced lithopone because of its superior qualities.

The CHAIRMAN. In other words, there was no manufacturing-cost cause for their differential. It was an artificial differential imposed to control the market.

Mr. BERGE. That is our position.

Dr. HUNTER. The very first paragraph bears that out, if you remember.

Mr. BERGE. Yes. They admit that in the first paragraph of my statement today, where I quoted from their definition of a cartel. They expressly say that one of the reasons is to protect the profits in lithopone.

One of the worst features of cartel control lies in the overlapping of fields which is found in the case of large companies such as du Pont and I. G. Farben. These companies are largely concerned not only with the production of pigments but also of many other chemical products.

One recalls the efforts which were expended in research work in the du Pont laboratories to treat copper phthalocyanine developed for paint and lacquer so that it would be unusable in the textile dyestuff field. One can only be sure of one thing: If titanium has any possibilities of use in other fields, the technologists who will be most likely to find such uses are those who are free from hampering restrictions.

Technology is prostituted when its research is directed toward preserving monopoly control rather than production of better and cheaper products. The extent to which great companies will go in requiring their technologists to make products useless rather than useful has been demonstrated to this committee in a previous hearing.

It is clear from documents taken from the files of these companies that there has been flagrant abuse of the patents in this case. It was for such abuse that the grand jury indicted the companies and certain of their officials.

The CHAIRMAN. Do you have a copy of the indictment which the committee could have?

Mr. BERGE. Yes.

The CHAIRMAN. Thank you.

(The document referred to was received, marked "Exhibit No. 156," and is on file with the committee.)

Mr. BERGE. Under the pretext of licensing each other under certain patents, the corporations National Lead and du Pont have monopolized the manufacture and sale of titanium compounds in this country. They account for 90 percent of the entire output, and the two small companies which are allowed to provide the remaining 10 percent do so under licenses from National Lead and du Pont which definitely restrict their freedom of action.

Digitized by Google

It is difficult to believe that the public interest has been adequately served by having this most valuable of white pigments subjected to complete control in this country and throughout the world by a cartel. What steps a free technology unfettered by cartel restrictions might have taken one cannot say with certainty. One may be quite sure that when the cartel shackles are broken, titanium will take its rightful place as not only the most important and useful of all pigments, but also for many other industrial uses.

The CHAIRMAN. Has the War Department requested the Department of Justice to postpone the case against these companies?

Mr. BERGE. Not yet. The indictment was returned in June, but I understand that National Lead has asked the War Department to request the postponement, and it's under advisement in the War Department.

The CHAIRMAN. Under the guise that this will hamper the war effort, I presume.

Mr. BERGE. Yes. Of course, I don't know what representations were made to the War Department, but it would have to be substantially that, because our understanding is that the only basis for postponement of a suit is if the War or Navy Department, or both, request it on findings by them that the prosecution of the suit in wartime will interfere with the prosecution of the war. So the War Department would have to be satisfied of that and take the responsibility of requesting us to postpone it.

The CHAIRMAN. Of course, there is no over-all technical agency to give advice to the War Department as to the effect of this, and therefore the War Department has to act to a certain extent blindly and accept the representations of National Lead. Isn't that about the fact?

Mr. BERGE. I think so.

The CHAIRMAN. Would such an over-all Federal technical agency, in your opinion, have been of assistance in this set-up at the present time?

Mr. BERGE. I should think so. I should think that if there had been such an agency in effect, say, about 1920, when this basic agreement was made, or even earlier, to have observed the development of this new pigment, such an agency would have been aware of the tremendous implications of the scientific development that was occurring and would have been in a position to advise the Department of Justice then as to the importance, from the scientific standpoint and the economic standpoint, of the monopolization that was occurring, and suggest legal action. Perhaps the facts would have come to our possession much sooner. That is, we depend now to a large extent on private complaint and what we can find out through our own initiative, but we don't have the guidance of any such organization, either, and I should think, if it existed, it would catch a thing like this. It would see it much earlier than we can, operating by our own devices.

The CHAIRMAN. Mr. Berge, prior to World War No. 1, we had practically left chemical research in Germany's hands.

Mr. BERGE. I think so.

The CHAIRMAN. During World War No. 1 and immediately following it, we would have sprung to a commanding position in the

Digitized by Google

chemical industry. But they put handcuffs back on us with cartels. Isn't that so?

Mr. BERGE. I should say so. The 162 cartels of I. G. Farben show that.

The CHAIRMAN. So that I. G. Farben became an economic foreign-relations bureau for the German Government, to trade all competitors out of fields and to get control of the scientific research again by such agreements.

Mr. BERGE. That's right.

Dr. HUNTER. I assume you might be interested in the gasoline technology.

The CHAIRMAN. Very much.

Dr. HUNTER. A gentleman who seems to have gone into it to a considerable extent left with us a rather lengthy memorandum on the subject, and it was our idea that it might be presented to the committee, if they can make use of it. He stated that it could be presented to the Kilgore committee. Originally he thought he would present it to the Patents Committee, but they are not in session, I think.

The CHAIRMAN. I would very much appreciate getting that.

Dr. HUNTER. It's a fascinating document, and it traces the development of the Universal Oil Products Co. and the domination of the gasoline cracking industry.

The CHAIRMAN. Who is head of the Universal?

Dr. HUNTER. Hiram J. Halle, and Dr. Egloff is the director of research.

The CHAIRMAN. Who, instead of stating that in the newspapers, always lists himself in as the president or secretary of some chemical society?

Dr. HUNTER. That's right; of the American Institute of Chemists.

The CHAIRMAN. What are the ramifications of that organization known as Universal Oil Products Co.?

Dr. HUNTER. It isn't an oil company or an oil production company in the sense of selling either of those things. It holds processes and gets patents on processes and then licenses them for the refining and treatment of petroleum products.

The CHAIRMAN. Does it do a lot of research work?

Dr. HUNTER. Yes; I think they have extensive laboratories.

The CHAIRMAN. But they produce nothing except, shall we say, lawsuits over patents if somebody happens to get in their way.

Dr. HUNTER. Well, lawsuits don't come as often as you would expect. There have been a good many lawsuits, but some of these processes of these companies—the Gasoline Products Co. and the Universal Oil Products Co.—have gone unchallenged for considerable lengths of time. That's all described in this memo.

The CHAIRMAN. Who owns Universal?

Dr. HUNTER. It is owned by Shell, Standard of California, and Atlantic has a small interest.

The CHAIRMAN. That's Royal Dutch Shell.

Dr. HUNTER. That's right.

The CHAIRMAN. That is foreign-owned, is it not?

Dr. HUNTER. That's right.

The CHAIRMAN. Foreign-controlled, at least.

Dr. HUNTER. That's right.

Digitized by Google

The CHAIRMAN. Standard of California is another stockholder, and also Atlantic?

Dr. HUNTER. Atlantic has 16 percent or something of that sort—very small.

The CHAIRMAN. In other words, it's another combination between one large foreign company and two American companies.

Dr. HUNTER. That's right. The C. R. A.—Catalytic Research Associates—which was discussed in the Standard Oil hearings before the Patents Committee, includes four major oil companies, Universal Oil Products Co., and the M. W. Kellogg Co. It is because of participation in that C. R. A. arrangement that Universal is a factor in the present production of aviation gasoline.

The CHAIRMAN. Tremendously interested financially in the monopolistic control of patents.

Dr. HUNTER. Exactly so. I think your committee will find this an interesting piece of writing.

Dr. SCHIMMEL. I wonder what are some of the main charges made, Dr. Hunter.

Dr. HUNTER. The main charges are that Universal Oil Products Co. and the Gasoline Products Co. have, over a period of years, through various devices, made it difficult for persons to get along in the gasoline or petroleum refining business without doing business with those two agencies. Some of the devices which have been used are described in some detail. It isn't brought clear down to date, because the memo was prepared some time ago. Actually what has come out since this was prepared is probably as damaging as anything in the memo itself.

You may have noticed this item in the Washington papers. This is from the Post of October 20, 1943. It is only two or three short paragraphs. I'll read it:

Thomas Raeburn White, prominent Philadelphia attorney, who conducted a 2-year investigation for the Third United States Circuit Court of Appeals into the judicial conduct of former Circuit Judge J. Warren Davis, reported to the court today that he believed Davis handed down six "crooked decisions"—five in the bankruptcy case of William Fox, one time millionaire movie magnate.

The sixth decision was in favor of the Universal Oil Products Co. in a patent case involving several millions of dollars, the report said. White added that he believed Davis received "a financial share" of a $50,000 fee which he said the Universal Co. paid its attorney, Morgan S. Kaufman, of Scranton, Pa. The report recommended that the decision be set aside.

Kaufman handled Fox's bankruptcy litigation.

Fox pleaded guilty 2 years ago to a charge of conspiring with Davis and Kaufman to obstruct justice and defraud the United States and was sentenced to a year-and-a-day in prison.

Davis and Kaufman were indicted on the same charges but two juries failed to agree and the charges were dropped.

I have here a copy of the master's report, which is commented on in that.

The CHAIRMAN. Could you leave that with us, too, please?

Dr. HUNTER. I will do so; yes.

The CHAIRMAN. All those millions referred to in the newspapers are paid by the gasoline users of the United States.

Dr. HUNTER. Yes. The gasoline users have provided the entire income. I think that has actually run into hundreds of millions of dollars from phenagling with patents, as described in this memorandum.

Dr. SCHIMMEL. Did the Department of Justice, Dr. Hunter, ever investigate Universal Oil Products?

Dr. HUNTER. Mr. Berge can answer better than I. My understanding is that recently we were authorized to do so and are about to undertake that investigation.

Mr. BERGE. That's right.

The CHAIRMAN. We will be pleased to hear of any progress made in that investigation, and we would like very much if we could get the information secured for the committee.

If that is all, gentlemen, we will adjourn.

(Whereupon, at 12:27 p. m., the subcommittee recessed subject to the further call of the Chair.)
